## KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate.  
 â " " senate, chaotic.  
 ā " " glare, care, and as e in there.  
 ă " " am, at.  
 ǣ " " arm, father.  
 á " " ant, and final a in America, armada, etc.  
 α " " final, regal, pleasant.  
 a " " all, fall.  
 ȃ " " eve.  
 ē " " elate, evade.  
 ẽ " " end, pet.  
 ẽ " " fern, her, and as i in sir, etc.  
 e " " agency, judgment.  
 ī " " ice, quiet.  
 ī " " quiescent.  
 ī " " ill, fit.  
 ō " " old, sober.  
 ō " " obey, sobriety.  
 orb " " orb, nor.  
 ȝ " " odd, forest, not.  
 o " " atom, carol.  
 oi " " oil, boil.  
 ōō " " food, fool, and as u in rude, rule.  
 ou " " house, mouse.  
 ū " " use, mule.  
 ū " " unite.  
 ũ " " cut, but.  
 u " " full, put, or as oo in foot, book.  
 ũ " " urn, burn.  
 y " " yet, yield.  
 ʙ " " Spanish Habana, Córdoba, where it is like English v but made with the lips alone.

ch as in chair, cheese.  
 d " " Spanish Almodovar, pulgada, where it is nearly like th in English then.  
 g " " go, get.  
 ɡ " " German Landtag = ch in Ger. ach, etc.  
 h " " j in Spanish Jijona, g in Spanish gila; like English h in hue, but stronger.  
 hw " " wh in which.  
 k " " ch in German ich, Albrecht = g in German Arensburg, Mecklenburg, etc.  
 ɲ " " in sinker, longer.  
 ɳ " " sing, long.  
 N " " French bon, Bourbon, and m in the French Étampes; here it indicates nasalizing of the preceding vowel.  
 sh " " shine, shut.  
 th " " thrust, thin.  
 th " " then, this.  
 zh " " z in azure, and s in pleasure.

An apostrophe ['] is sometimes used as in tā'b'l (table), kǎz'm (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as ɡ, ɲ, ɳ, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

# A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XXI

# THE NEW INTERNATIONAL ENCYCLOPÆDIA

**SHILOH** (Heb. *Shiloh*). A city of Ephraim, 12 miles south of Shechem, where Joshua is said to have divided that part of the land of Canaan west of the Jordan. (Josh. xviii. 10.) Its historical importance is due chiefly to its having been a sacred place where a festival was held annually in honor of Yahwe (Judg. xxi. 19-21) and to which annual pilgrimages were made by the Hebrews till the days of Samuel. (Cf. 1 Sam. i. 3.) The sanctuary at the place was a permanent structure (*hekal*, or temple), the destruction of which, possibly by the Philistines, made so deep an impression that it is referred to in the later literature. (Ps. lxxviii. 60; Jer. vii. 12.) Jeremiah distinctly speaks of it as having been once the dwelling place of Yahwe, and this historical significance of the place is illustrated in the narrative which makes Shiloh the depository of the ark of the Covenant and the abode of the tabernacle from the time of the conquest until the capture of the ark by the Philistines. (1 Sam. i-iv. 11.) Ahijah, the prophet, was a native of this place. The ancient name is preserved in the modern village of Seilun, which shows traces of various ancient buildings. Consult V. Guérin, *Samarie*, vol. ii, pp. 20 et seq. (Paris, 1875), and Benzinger, in Baedeker, *Palestine and Syria* (5th ed., Leipzig, 1912).

**SHILOH, BATTLE OF**, frequently called the **BATTLE OF PITTSBURG LANDING**. A battle of the Civil War fought at Pittsburg Landing in Tennessee, on the west bank of the Tennessee River, about 20 miles north of Corinth, Miss., on April 6 and 7, 1862, between the Federal Army of the Tennessee, reinforced by the Federal Army of the Ohio, in all about 62,500 men, under General Grant, and the Confederate army of Mississippi, about 40,500 men, under Generals A. S. Johnston and Beauregard. It takes its name from Shiloh Church, near Pittsburg Landing. On March 17, 1862, General Grant took command of the Federal forces stationed at Pittsburg Landing, and by April 1 he had an army of about 45,000 men. On March 15 General Buell, commanding the Army of the Ohio, began his march from Nashville to effect a junction with Grant, a combined offensive being planned for the two armies. General Johnston, with a large Confederate force at Corinth, determined to strike Grant before Buell could arrive and on April 3 ordered a general advance. Owing, however, to rains and bad

roads, the Confederate army was not ready for action at Pittsburg Landing until late on April 5, and the attack was not delivered until early the following morning. Meanwhile the Federal officers seem not to have anticipated an attack in force and to have made no provision for such an attack nor even to have maintained cavalry scouts between Pittsburg Landing and Corinth.

SHILOH.

On the night of April 5 Grant went as usual to his headquarters at Savannah, 9 miles down the river, on the east side, where he expected to meet Buell the next morning. The positions of the two armies on the morning of April 6 are shown on the map. Of the Army of the Tennessee the only division at that time not on the field was Gen. Lew Wallace's division, stationed at Crump's Landing, 5 miles below Pittsburg Landing and on the same river bank.

At 7 A.M. Sunday, April 6, the engagement began with an attack on the Federal right under Sherman. Soon the whole Federal line was forced back, taking successive positions, gradu-

ally withdrawing before the Confederates—parts of the army acting more or less independently of one another—until the Confederates had secured the field and the Federals had formed a new line diagonally from Pittsburg Landing to Snake River. The most stubborn fighting of the day occurred at what the Confederates called the Hornet's Nest—a position assumed by W. H. L. Wallace, Hurlbut, and Prentiss about 10 A.M. and held by them against repeated assaults for five or six hours. It was here that about 2.30 P.M. General Johnston on the Confederate side was killed, Beauregard then assuming command. About 4 o'clock Hurlbut, attacked in front and flank, was forced to withdraw, and an hour later the divisions of Wallace and Prentiss were attacked in front and on both flanks. General Prentiss with about 2200 men was forced to surrender, and though Gen. W. H. L. Wallace's division managed to withdraw without being surrounded, General Wallace himself was killed. Grant arrived on the battlefield from Savannah about 8 A.M., but apparently exercised little control over the movements of the Federal troops during this first engagement. Late in the afternoon the Federal army was reinforced on its left by a division of Buell's army under General Nelson, which took part in the last fighting of the day. Before the battle was renewed on the 7th the Federal right had been reinforced by Gen. Lew Wallace, with his division from Crump's Landing, and its left by a large part of Buell's army. The Federals attacked vigorously early on the 7th and by 4 P.M. had driven the Confederates back beyond Shiloh Church, where Sherman had been originally stationed. Some pursuit of the Confederates was made, but it was effectually checked by Forrest; Beauregard withdrew to Corinth (q.v.), whither soon after he was followed by Halleck, who had assumed command in person of the Federal army. In the battle of Shiloh the Federal loss in killed, wounded, and prisoners was about 13,000; that of the Confederates about 10,700. By their defeat at Shiloh the Confederates lost all their hold on Tennessee west of the mountains, except two or three forts of the Mississippi, which were soon taken from them. Consult: *Official Records*, vol. x, parts i, ii; Swinton, *Twelve Decisive Battles of the War* (New York, 1867); Force, *From Fort Henry to Corinth* (ib., 1881); Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. i (ib., 1887); Nicolay and Hay, *Abraham Lincoln: A History* (ib., 1890); Grant, *Personal Memoirs* (2 vols., ib., 1895); Ropes, *Story of the Civil War*, vol. ii (ib., 1898); Steele, *American Campaigns* (Washington, 1909).

#### SHILOH NATIONAL MILITARY PARK.

See PARK, NATIONAL MILITARY.

**SHIMABARA**, shē'mā-bā'rá. A city of Japan, situated on a small peninsula in the west of Kiushu, opposite Kumamoto (Map: Japan, B 7). It is famous on account of the rebellion of the peasants in 1637-38. Excited by misgovernment, they revolted, defeating the troops of their lords and seizing the ruined castle at Shimabara, which they fortified. The Shogun sent an army to put down the revolt. Meanwhile companies of Christians, who had been persecuted for 20 years by the government of the Shogun, joined the rebels. The siege lasted for 102 days, the castle yielding on April 12, 1638. All within it were massacred. The assailants, however, suffered at least an equal loss. The Dutch in Nagasaki sent their guns and ships to

be used against the insurgents. Pop., about 20,000.

**SHIMODA**, shē'mō-dā. A seaport of Japan, situated at the extremity of the Idzu Peninsula, in central Hondo, over 60 miles south of Yokohama (Map: Japan, F 6); the first Japanese port opened to American trade. It was visited by Commodore Perry in 1854 and became in 1857 the residence of the first American Minister to Japan. The present population is about 1000.

**SHIMONOSEKI**, shē'mō-nō-sā'kē, or, more correctly, **AKAMAGASEKI**, ā'kā-mā-gā-sā'kē, or, in Sinico-Japanese, **BAKAN**, bū'kān'. A fortified maritime town of Japan, in the old Province of Choshu and Prefecture of Yamaguchi, situated at the southwestern extremity of the main island (Map: Japan, B 6). It is the southern terminus of the railway system of Hondo and stands directly opposite the town of Moji, which has sprung up in connection with the development of the railway system of Kiushu. The two form a single consular district. Pop., 1908, 58,254.

Here occurred what is known as the Shimonoseki affair, in which in 1864 by a combined naval force of 17 warships—United States, British, Dutch, and French—the Choshu clan was chastised for having fired in 1863 without provocation on foreign vessels flying the United States, French, and Dutch flags, and an indemnity of \$3,000,000 was exacted. The last installment of this sum was paid in 1874. At a later date, however, the United States government refunded its share, and the money was used by the Japanese for educational purposes. Here in April, 1895, was concluded by Li Hung Chang, acting for China, and Marquis Ito, for Japan, the treaty of peace which ended the Japanese-Chinese-Korean War.

**SHI'NAR**. An Old Testament designation of Babylonia (q.v.).

**SHINER**. A name applied to many small fishes of a silvery lustre belonging mainly to the minnows. They are found in the streams of North America. A few species have received popular names, as a dace, the redbfin (*Notropis cornutus*), and the golden shiner or bream (*Abramis chryssoleucas*). For the blunt-nosed shiner, see MOONFISH. See Plate of DACE AND MINNOWS.

**SHINGKING**, shing'king', **SHENGKING**, or **FENGTIEN** (Map: China, M 3). The wealthiest and the most important, though the smallest, of the three provinces which compose Manchuria (q.v.). Area, about 56,000 square miles. It is roughly triangular in shape, the apex pointing southward and ending in the peninsula of Lao-tieh Shan and Port Arthur (q.v.). The northeastern part of the province is occupied by the Shan-a-lin mountain system, whose extensions form the Ts'ien Shan ranges, a long spur of which extends southwest through the peninsula. The western portion is drained by the Liao, and the eastern by the Tayang, and partly by the Yalu Kiang. The soil is fertile, producing abundant crops of wheat, barley, millet, maize, pulse, potatoes, cotton, hemp, indigo, tobacco, opium, sesameum and other oil-producing plants, etc. Cattle raising is an extensive industry, and much wild silk is produced. Gold is found, coal and iron occur in many places and are worked, and there are large areas of valuable peat. Two railways—the Chinese from Peking via Shanhai-kwan and the Russian from Port Arthur northward to Harbin—traverse the province, but com-

munication is chiefly by roads. The chief ports are Yingtse (commonly spoken of in connection with Niuchwang), Port Arthur (q.v.), Talienwan (q.v.), Pitsewe, and Takushan, all dominated by Japan under the conditions of the treaty between that country and Russia, Dec. 22, 1905.

The population is estimated at 5,500,000, almost exclusively Chinese.

For centuries Shingking was held by the Chinese, who made Shinyang (Mukden) the capital. In 1894-95 the southern part from the Yalu to the Liao was captured by the Japanese, but was later relinquished under pressure from Russia, Germany, and France. After 1898, when Russia leased the southern portion of the peninsula and secured a neutral zone reaching to the middle of the Tayang River and including the village of Takushan, Russian influence prevailed until Japanese interests succeeded Russian. See Sir Alexander Hosie, *Manchuria: Its People, Resources, and Recent History* (London, 1910). See MANCHURIA.

**SHINGLES.** See HERPES.

**SHIN-GON'** (Jap., True Word). A Japanese sect of Buddhists. It was founded in the beginning of the ninth century A.D. by Kobo Daishi. Dissatisfied with Buddhism as taught in Japan, he visited China in 802-804 and returning formed his sect. The worship centres in Vairocana, a quasi-divine being, who is a greater Buddha; he is truth, and his emblem is the sun. He is represented as surrounded by four planets, Gautama being one of them, and these again by smaller satellites, and these again by others forming a complete system. This represents the unchanging universe of pure ideas, the "diamond world," the true world, only intellectually conceived. Around Vairocana is arranged, like the petals of a lotus, also the phenomenal world, so that all things centre in him. There are two ways of approach, by the intellect and by morality. He who attains salvation perceives the complete unity of both systems and becomes himself identical with Vairocana. The sect was eclipsed in popularity by the rise of the Shin Shu (q.v.) and the Nichiren sects and at present has comparatively little influence. Consult: Nanjo, *Short History of the Twelve Japanese Buddhist Sects* (Tokyo, 1887); Griffis, *The Religions of Japan* (New York, 1895); G. W. Knox, *The Development of Religion in Japan* (ib., 1907).

**SHINN, EVERETT** (1873- ). An American painter and illustrator. He was born in Woodstown, N. J., and studied art at the Pennsylvania Academy of Fine Arts, Philadelphia, and in Paris, where he was influenced by the work of Degas. He first gained recognition with his pastels—street scenes in Paris and New York, cafés, and music halls, and also portraits—his style being somewhat reminiscent of Watteau and Fragonard, with harmonious yet daring color schemes, sure and rapid brushwork. Later he devoted himself to mural painting and magazine illustration. His mural decorations include two huge panels in the Trenton City Hall, depicting, with powerful realism, the chief industries of the city; the decorations in the Belasco and Stuyvesant theatres in New York and in private residences. He made his residence in New York and exhibited frequently.

His wife, FLORENCE SCOVEL SHINN, became well known by her quaint book illustrations for *Lovey Mary*, *Mrs. Wiggs of the Cabbage Patch*, *Comiston*, etc.

**SHIN'NECOCK.** A remnant tribe of Algonquian stock (q.v.) residing about the bay of the same name near the southeast end of Long Island, N. Y. At the beginning of this century they numbered only about 150 persons, all more or less of negro admixture, and had entirely lost their language and all other primitive characteristics. They have no relations with the general government, but the State of New York supports a school at East Moriches for the benefit of them and the two other Long Island remnants, the Poospatuck or Unquachog, and the Montauk, numbering only a few families each. Consult Harrington, in *Journal of American Folk-Lore*, vol. xvi (Boston, 1903), and in *Southern Workman*, vol. xxxii (1903).

**SHINNECOCK BAY.** A large but shallow bay, on the southern shore of Long Island, N. Y., 28½ miles west of the eastern extremity of the island. It is about 8 miles long, from 3 to 4 miles wide, and is separated from the ocean by a narrow sand beach.

**SHINNECOCK HILLS.** A town in Suffolk Co., Long Island, N. Y., 85½ miles by rail east of Brooklyn, on the Long Island Railroad. It is a small summer resort, named after the Shinnecock (q.v.) Indians, a few of whom occupy a reservation in the vicinity.

**SHIN-NUNG**, shēn'noōng' (Chin., Divine Husbandman), or SHĒN-NUNG. The second of the legendary rulers of China known as the Wu Ti, or Five Emperors. He succeeded Fuh-hi (q.v.) in 2737 B.C. and is said to have been the offspring of a certain princess who conceived under the influence of a dragon. He is credited with having introduced plows, discovered the Five Grains and the medicinal properties of plants, and to have instituted markets for the exchange of commodities. The Temple of Agriculture at Peking (q.v.) is dedicated to him. He was succeeded by Hwang-ti (q.v.) in 2697 B.C. Consult Friedrich Hirth, *Ancient History of China* (New York, 1911).

**SHINNY.** See HOCKEY, *Ice Hockey*.

**SHIN-RAN SHO-NIN** (1173-1262). A Japanese Buddhist theologian and the founder of the Shin Shu (q.v.), which he established when expelled from his monastery. He was of noble birth, of the great Fujiwara clan, and was educated in the monastery of the Jodo sect of Buddhists on Hiei Zan, near Kyoto.

**SHIN SHU** (Jap., True Sect, full name *Jodo Shin Shu*, True Sect of the Pure Land). A Japanese Buddhist sect. As its title indicates, it is a branch of the Jodo (Pure Land) sect. Like the other Buddhist bodies in Japan the Jodo derived its teaching from China. It believes in Amida (Skt., Amitabha) only, the Buddha of boundless light, life, and mercy, one of the many beings worshiped in the Great Vehicle. Raising himself to Buddhahood, he vowed to create a Pure Land, to be glorified forever as Buddha of Boundless Light, to save all who should put their faith in his vows. Hence the object of faith is not the historic Buddha, but the vow of Amitabha. Salvation being solely by faith in the vow, the believer needs neither knowledge nor works. Rites and ceremonies are without efficacy, though the believer as an expression of gratitude lives an upright life and constantly repeats "Glory to Amida the Buddha." The priest is simply the official of the sect and its teacher, all essential distinction from the layman being done away. The priests marry, eat meat, and practice no austerity. The

sect is first in popularity with the masses. Its temples are the most magnificent and the most frequented. At present it is the most progressive sect in the Empire, adopting the methods of Christian missions and sending some of its priests as students to Europe and America. In the fifteenth and sixteenth centuries it took part in the feudal wars, armed its priests, and turned its monasteries into fortresses. For more than a century it ruled the great Province of Kaga. Shin Shu is Buddhist only in name, retaining nothing of the teaching of Gautama and according him no honor. Consult: Nanjo, *Short History of the Twelve Japanese Buddhist Sects* (London, 1887); Griffis, *The Religions of Japan* (New York, 1895); G. W. Knox, *The Development of Religion in Japan* (ib., 1907).

**SHINTO**, shin'tō, or **SHINTOISM** (Sinico-Jap. *shintō*, the way of the gods). The ancient religion and mythology of the Japanese. The history of the religion falls into three periods, the first terminating in the sixth century A.D., the second in the eighteenth century A.D., and the third continuing until the present time. In the first period the religion had no name and was perhaps undifferentiated from other rites. It had neither dogmas, moral precepts, nor sacred writings. The objects worshiped were called *kami* (superior). Some gods were good and some were bad, some were mortal, and some were wedded to women. From one of the latter class of gods is descended the Emperor. There were deities also of the caldron and kettle and saucepan, gods of the kitchen and of the gate, as well as gods of pestilence, storms, and heavenly bodies. In fact there was no distinctive class of gods, but everything was worshiped which excited fear or admiration. The rites were purifications by water from crimes and defilement; the offerings were anything of value, swords, armor, spears, and especially cloth, which has become the peculiarly cut strips of paper called go-hei which hang before the shrines. The prayers were thanksgivings and lists of offerings.

The second period begins with the sixth century, when Buddhism and Chinese civilization were introduced. Shinto soon yielded to its rival, the native gods being regarded as incarnations of Buddha. (See KOBO DAISHI.) Buddhist priests became the custodians of the shrines and introduced their own ornaments, images and ritual. The two religions were united under the name *Ryobu-Shinto* (the Shinto of two kinds), a mongrel system in which Buddhism was the active partner. The mythology was written down with the ancient prayers. Only in the palace of the emperors, who were themselves Buddhists, and at a few of the great shrines were attempts made to preserve something of the ancient usage. The distinctively Shinto priests became fortune tellers and magicians.

In the eighteenth century a succession of great scholars (Mabuchi, 1697-1769; Motoōri, 1730-1801; Hirata, 1776-1843), animated by a love for antiquity and a hatred of all things foreign, attacked Buddhism and Confucianism and sought the reestablishment of pure Shinto. They taught that its essence was obedience to nature and to the Emperor. They produced marked effects in literature and in politics, but Shinto was too shadowy and ill-defined to gain religious hold of the people. The sentiment aroused was utilized by the revolutionists of 1865-68 when the western clans overthrew the government of the

Shogun and restored the Emperor to the head of the government. At the restoration Buddhism was disestablished and Shinto put in its place. But Shinto could not maintain itself and became a code of ceremonies for court and officials. At present it represents the intense patriotism of the people and furnishes the rites for religious ceremonial at the court, all officials being obliged to observe its forms.

**SHIP, ARMED.** See ARMED SHIP.

**SHIP, ARMORED.** The first real armored vessels were floating batteries used at the siege of Gibraltar in 1782, and the first proposal to build an armored steam vessel seems to have been

GLOIRE, FRANCE, 1858.

made by Col. John Stevens of New Jersey, who in 1812 prepared plans for such a craft, but his proposals were rejected as chimerical. (See ARMOR PLATE.) In 1841 his son, Robert L.

WARRIOR, ENGLAND, 1859.

Stevens, submitted plans to the United States Navy Department for the construction of an ironclad steamer of high speed in which all of the machinery, including the propellers, should be below water. The plans were accepted, but the construction of the vessel was deferred, as it was considered desirable to increase the thickness of armor carried from 4.5 to 6.75 inches. The necessary changes in the plans and delays, due to other causes, prevented the laying of the keel until 1854, only two months before the commencement of the Kinburn batteries (see ARMOR PLATE), but it is to be noted that Stevens's vessel was a high-speed seagoing ship and not a floating battery. After the death of Stevens in 1856 the construction was continued by his brother, E. A. Stevens, but owing to lack of money and other difficulties it was never completed. In consequence of this failure the French were the first to produce a seagoing armor-clad; the work of Paixhans (q.v.), in France, called attention there to the armoring of ships. Four vessels

ARMOR OF AN EARLY IRONCLAD, H. M. S. BLACK PRINCE, SISTER SHIP TO WARRIOR.

SHINTOISM

1. SHINTOIST PRIEST CARRYING GOHEI

2. A SHINTOIST SHRINE AT YAMADA

were commenced in 1858. The hulls and machinery of the *Gloire*, *Invincible*, and *Normandie* were similar to that of the screw line-of-battle ship *Napoleon*, except as they were modified to receive the armor; the other vessel, the

*Couronne*, had a hull of iron. The first to be completed was the *Gloire*. She was therefore the first seagoing armor-clad.

In 1859 the British commenced the broadside iron frigate *Warrior*. In 1860 the Italians ordered the armored frigates *Terribile* and *Formidabile* in France, and in the latter part of 1861 the Russians changed the plans of the wooden frigate *Petropavlovsk*, then building, and gave her a complete water-line belt and casemate of iron. Up to this time the application of armor had brought about no material change in ship design except to reduce the number of decks on which guns were carried, but it somewhat increased the calibre of the guns and

tion she was covered by 4.5-inch iron plates of large size, extending from some distance below the water line to the upper deck. The broadside armor was joined at the ends by thwartship plating of equal thickness, the whole forming a citadel protecting the battery, boilers, and engines. She was 232 feet long, 58 feet broad, and had a displacement of 4120 tons at her designed load draft. Her battery consisted of sixteen 11-inch Dahlgren smoothbores, two 220-pounder Parrott rifles, and four 24-pounder howitzers. She was the most successful armored ship of her day, was in action more times than any vessel ever built, and was struck by more projectiles than any other (so far as existing records show), yet her armor was never pierced, she was never put out of action, and she was never forced to go to a home port for repairs or to depend upon outside assistance; while, in some of the engagements in which she took the leading part, other ironclads were sunk, and several monitors were disabled and forced out of action. After the war, in 1866, she was accidentally destroyed by fire at the Philadelphia Navy Yard.

The third vessel was the far-famed *Monitor*

MONITOR AND MERRIMAC.

caused the rifled gun to be generally adopted everywhere but in the United States. In 1861 the *Monitor*, *Merrimac*, and *Rolf Krake* (which will later be referred to) were designed. The *Monitor* and *Merrimac* differed from previous men-of-war in being mastless; each was completely armored; one mounted its guns in a revolving turret, the other in a central armored battery.

In 1861 the United States Congress passed an Act providing for armored vessels, and pursuant to its provisions the *Galena*, *New Ironsides*, and *Monitor* were built. The *Galena* was of ordinary type, except that her sides amidships tumbled home (i.e., inclined inward) at an angle of 45 degrees and were covered with 2.5 inches of armor. Her plating was found to be too thin to be of much use, and she was regarded as a failure. The *New Ironsides* was finished late in 1862 and attached to the blockading fleet off Charleston, where she remained for two years. Her hull was of wood, and her general plans were similar to those of an ordinary steam frigate of her day, except that she had a ram bow and a retreating stern like that of many recent battleships. Her sides tumbled home at an angle of about 30 degrees from the vertical for about two-thirds her length, and over this por-

(q.v.). The contract for her construction was signed Oct. 4, 1861, and she was launched Jan. 30, 1862. Her dimensions were: extreme length, 172 feet; length of hull proper, 124 feet; extreme beam, 41.5 feet; width of hull where it joined the overhang, 34 feet; width of hull at bottom, 18 feet; depth of hold, 11.33 feet; mean draft, 10.5 feet; inside diameter of turret, 20 feet; height of turret, 9 feet; displacement, 987 tons. The *Monitor* was remarkable in many ways, but she was not a seagoing vessel, but a floating battery, useful only in smooth water, and she was fortunate in meeting a craft equally unseaworthy. She was not even the first turret vessel to be commenced, nor was she the best. Early in 1861 Denmark had contracted with Capt. Cowper Coles for the building of the double-turreted, seagoing, ironclad *Rolf Krake*, and her keel was laid before the contract for the *Monitor* was signed, though she was not completed until 1863. The *Krake* was a very successful vessel and, although she was never in close action with another ship, silenced the Prussian batteries several times and held the whole Prussian fleet in check in 1864.

Eriesson, however, was probably the first to produce plans of a practical revolving turret mounted on board a vessel, as there seems to

have been no design of one antedating that he sent to Napoleon III in 1854. Ericsson's *Monitor*, also, was the first completed vessel carrying

ERICSSON'S IRONCLAD CUPOLA VESSEL, 1854.

a revolving turret, and while many of her details were faulty, others were successful, original, and ingenious in the highest degree.

The fight between the *Monitor* and the *Merrimac*

resulted in the retirement and neutralization of the *Merrimac* and complete protection of the unarmored fleet. Almost every nation in

ADMIRAL LAZAREFF, RUSSIA, 1864.

Europe also built vessels of the monitor type, but the evolution of the turret ship proceeded rapidly, though the value of broadside fire from

MONARCH, ENGLAND, 1866.

numerous guns was never quite forgotten, and in a modified form it displaced the turret.

In 1863 the British converted several vessels into turret ships with four turrets (*Royal Sov-*

DEVASTATION, ENGLAND, 1869.

*ereign* class). The North German Confederation ordered the *Arminius*, a turret ship of 1600 tons, similar to the *Rolf Krake*. France commenced a number of turret vessels of about 3000 tons

ALEXANDRA, ENGLAND, 1873.

(*Taureau* class). Italy, which was building a number of broadside and central-battery ships, ordered the turret ship *Affondatore*. Russia, the Netherlands, Norway, and Sweden began the

construction of numerous monitors of the American low-freeboard type.

During the next dozen years nearly all the armor-clads built by England, France, Germany,

DUILIO, ITALY, 1873.

and Italy were broadside or central-battery ships—usually the latter. The long row of guns on the broadside was soon given up, partly because of the difficulty of protecting so large an

INFLEXIBLE, ENGLAND, 1874

area by armor. The guns, decreased in number but increased in size, were gathered in a group amidships; to secure fire ahead and astern some were mounted in the angles of polygonal citadels

FURIEUX, FRANCE, 1875.

or in circular barbette towers over the corners of the central battery. Of the Great Powers, Russia alone adhered chiefly to the turret. The British naval policy was exceedingly changeable

AMIRAL BAUDIN, FRANCE, 1878.

during this period. The vessels built were about equally divided between turret ships and other types.

The definite return to turret ships was initiated by Italy in 1873 when she laid down the *Duilio* and *Dandolo* of 12,000 tons. In 1874 the British laid down the *Inflexible*. These ships were of unprecedented size; practically their whole battery was concentrated in four 100-ton guns (in the *Inflexible* four of 80 tons) behind very thick armor; the complete water-line belt was given up, and a central citadel extending less than half the length (in the *Inflexible* less than one-third), but of enormously thick armor, protected the vitals, but did not absolutely insure stability if the unarmored ends were destroyed; a submerged armor deck extended from the citadel to the bow and to the stern a few feet below water; and lastly their turrets, instead of being on the midship line, were arranged en echelon, the forward one close out to one side of the ship, and

SECTION OF MAJESTIC, 1893 (*Magnificent* class).

the after one close out to the other. This method of mounting theoretically doubled the fire ahead and astern; practically fire ahead or astern was

COMMONWEALTH, ENGLAND, 1901.

nearly destroyed by the interference of the upper works.

After 1875 no more broadside or central battery ships of importance were built for any

ITALIA, ITALY, 1876.

navy, though the turret and auxiliary battery went through many changes before the advent of the *Royal Sovereign* class of 1889. From that time until 1902 the design of British battleships

RE UMBERTO, ITALY, 1884.

was little changed. In the United States navy the sea officers supported a development of the *Iowa* type in which the auxiliary battery should consist of many (12 to 16) 8-inch guns. The

U.S.S. OREGON, 1891.

European practice reacted upon the designers of American ships, resulting in a momentary disappearance of the 8-inch gun, but in 1902

U.S.S. KEARSARGE, 1895.

7.5-inch and 8-inch guns began to appear in European designs. The calibre of the auxiliary battery guns of the British navy grew steadily

until in 1905 the British laid down the all-big-gun battleship *Dreadnought*. The advantages of a single calibre of large guns are numerous and important. In fighting at long range a ship with 12 large guns is about three times as power-

U.S.S. NEW JERSEY, 1902.

ful as one with four; a division of four such ships is therefore equal to a squadron of 12 ships of former types, and it may be more than equal through greater concentration of force and ease of handling.

The changes in battleship design brought out in the *Dreadnought*, aside from the battery, were considerable. Turbine engines were fitted, the

U.S.S. CONNECTICUT, 1902.

speed increased 2.5 knots, military masts of the old type were discarded, the quarters of officers were placed forward, and the displacement increased about 3000 tons (only about 1000 tons was intended) above that of the largest existing ships.

The appearance of the *Dreadnought* revolutionized battleship building. The single calibre of guns was accepted in all the major navies, but

BRITISH BATTLESHIP DREADNOUGHT, COMPLETED 1906.

the details of armor, gun mounting, and speed were differently solved in each. As far as gun emplacement is concerned the American system has gradually superseded all others. This places all the turrets on the centre line; the second turret is high enough to fire over the first, and

one of the afterturrets (not the aftermost) is high enough to fire over the others. This arrangement brings all guns into each broadside and gives a reasonably powerful and wholly unobstructed bow and stern fire.

The size of battleships and the calibre of their guns have continued to increase, while their

BRITISH BATTLESHIP QUEEN ELIZABETH, COMPLETED 1914.  
Note submerged antitorpedo armor.

armor has changed in many ways. To reduce turret interference 3-gun and 4-gun turrets have been adopted—the latter in the French navy only. In the United States the 2-gun turret is preferred, but 3-gun mountings are accepted in view of the improved bow and stern fire and

GERMAN BATTLESHIP KÖNIG, 1914.

freedom from interference of fire between turrets. In the British, German, and Japanese navies only two guns are mounted in a single turret. In the ships of different navies in 1916 the calibres adopted were as follows: United States, 14-inch; Great Britain, 15-inch; Germany, 15-inch; France, 13.4-inch; Italy, 12-inch;

UNITED STATES BATTLESHIP CALIFORNIA, 1915.

Russia, 12-inch; Japan, 14-inch; Austria, 14-inch. The largest battleships under construction in 1916 were the vessels of the *California* class in the United States navy, which have a displacement of 32,000 tons. The average speed of battleships is about 21 knots, though the Italian

vessels under construction in 1916 were to have 25 knots, the recent German battleships 23, and those of one class of British ships completed in 1915 have 25 knots.

The armor of battleships has tended to grow in thickness in recent years, owing to increasing calibres of guns carried. Much internal armor is now fitted. This consists of armored bulkheads and decks, which are designed to resist heavy shells and torpedo explosions. In United States ships about one-fourth the total weight of armor carried is internal. To provide for this additional weight without adding unduly to the displacement, all armor has been removed from over the auxiliary antitorpedo-boat battery, and the water-line belt is not carried to the stem.

The development of battleships in the United States navy has been nearly uniform. The first was the *Texas*, of 6300 tons, laid down in 1889. Her design was purchased in England and was not satisfactory. The vessels of the *Oregon* class, laid down in 1891, were highly approved except as regards freeboard. This was low, as Congress had appropriated for *coast-line* and not *seagoing* battleships. Their battery and armor made them the most powerful ships afloat. The *Iowa*, which followed in 1893, was a high-freeboard, seagoing vessel, and the glaring defect of the *Oregon* class was therefore corrected. The *Kearsarge* and the *Kentucky* (1896) were no great improvement on the *Iowa*, and the *Alabama* (1897) and the *Maine* (1899) classes were inferior to their predecessors in fighting ability, owing to the omission of the 8-inch gun in their auxiliary batteries, following European practice. The five ships of the *New Jersey* class were a distinct advance. Their armor was better, and the 8-inch gun again appeared in their batteries. The *Idaho* and the *Mississippi* were odd numbers, deficient in speed, and too small for their date. Their construction was forced on the Navy Department by Congress. Fortunately they were sold to Greece and are no longer in a position to hamper the movements of the second line of the fleet. The *Connecticut* (1902) class of six ships was excellent as to armor and machinery, but their guns should have been all 12-inch and 8-inch pieces—the 7-inch were a mistake. The vessels of the *Michigan* (1905) class were the first of American dreadnoughts and had the ideal gun arrangement, eight guns in four turrets on the midship line, the second and third turrets raised to permit their guns to fire over the first and fourth. In the later dreadnoughts, from the *Delaware* to the *California*, the improvement in armor and gun emplacement was uniform. The *California*, of 32,000 tons, twelve 14-inch guns, arranged to fire six ahead, six astern, twelve on each beam, oil fuel, direct electric drive, and a superior thickness and arrangement of armor, in 1916 had no superior in fighting capacity.

In addition to battleships three other classes of armored vessels are used—coast-defense ships, armored cruisers, and battle cruisers. Coast-defense ships are of no specific type; gunboats, monitors, and old battleships are utilized. They are of value under certain conditions, but are of too little importance for special consideration in this brief review. Armored cruisers once figured largely in the navies of the world, though the specific work for which they were suited was never very great and was much reduced by the increase of speed in battleships and the disappearance of the large protected cruisers. The

BATTLESHIP

BRITISH SUPERDREADNOUGHT "QUEEN ELIZABETH"

battle cruiser is not a development of the armored cruiser, but of the battleship. The theory of the armored cruiser was that guns and armor were sacrificed to speed. In the battle cruiser, guns of battleship size are retained, nor is the number much reduced. The greatly augmented speed is obtained at the expense of some reduction of armor and by increasing the displacement. Battle cruisers are therefore, as a rule, somewhat larger than battleships. Their rôle is a wide one. Their offensive powers enable them to cooperate with the first line of battle, to reinforce weak points quickly to strike weak points in the enemy's line, harry a fleeing enemy, to turn the enemy's flank, to obstruct the cruiser operations of the enemy and destroy his cruisers, to seize a distasteful base for fleet use before it can be reinforced and to do other things for which their high speed and offensive powers especially fit them. The original prototypes of the battle cruiser were the *Italia* and the *Lepanto*, built for the Italian navy in 1878-83, but the superiority of speed was insufficient, and a full realization of its possible rôle was not then grasped; therefore the type languished until resurrected in the *Invisible* class of the British navy, which was brought out immediately after the *Dreadnought*. The speed of the type has since risen from 21 knots in the *Indomitable* to 30 knots in the *Mercury*, and it was reported that battle cruisers building for the British and German navies in 1916 would have speeds of 32 knots or thereabouts. Up to

BRITISH BATTLE CRUISER ON, COMPLETED 1913.

1916 no battle cruisers had been built for the United States, French, Italian, or Austrian service, but it was expected that the United States at least would probably add some to its fleet in the near future.

**SHIP AND SHIPPING** (AS. *scip*, ship). The subject is treated in this article under separate heads in the following order: sailing ships; power navigation; development of the steamship and other forms of power-propelled vessels; classification of ships for marine insurance; merchant shipping; tables showing tonnage of ships in the mercantile navies of the world, etc.

#### SAILING SHIPS

In strictly nautical nomenclature, during the latter days of the sailing-ship era, the term "ship" was used to designate a large vessel with three or more masts, of which at least three were square-rigged. It is now quite generally used to designate any vessel large enough for the crew (and passengers if any) to live on board.

Among the earliest builders of ships were the Egyptians, Chaldeans, Hindus, and Chinese. The oldest existing records were left by the Egyptians. These indicate that Egyptian vessels large enough to carry 50 or more persons were in use more than 6000 years ago. So far as merchant vessels were concerned 30 centuries made but little change in them except a slight increase in size. From the days of the Phœnician ascendancy to the time of Columbus the improvement in size, speed, or seaworthiness was very slight. The high bows and sterns of the earliest-known designs were still retained. Few if any ships of the time were much over 100 feet in length.

The next three and a half centuries were an era of development, largely brought about by the discovery of America and the way to India around Good Hope, because the long voyages to America and India demanded vessels that were larger and more seaworthy. But, although the models were improved, the largest sailing ships, until after the advent of steam, rarely exceeded 200 feet in length, and the proportion of length to beam was about 4 to 1. The bows and sterns were still high; though no longer castle-like, the external shape forward was very bluff, at the stern hardly less so. This was particularly the case in merchant vessels and line-of-battle ships. Frigates and some trading craft were somewhat sharper. These full lines and broad beams gave great handiness in battle, in crowded harbors, and in narrow passages, also carrying power for a heavy freight or many guns and men, but they did not conduce to speed.

The advent of steam changed conditions mate-

rially. Sailing vessels soon ceased to be used as fighting ships; in the merchant service they had to compete with steamers. Handiness was therefore sacrificed to speed and the spread of canvas much increased. The famous clipper ships were intended for long voyages and frequently made such fast passages as to rival the best steamer records. The *Dreadnaught* made the passage from Liverpool to New York in 13 days, 8 hours and the *Red Jacket* in 13 days, 11 hours, 25 minutes. The ordinary fast mail-steamer passage was then about 10 days.

Modern sailing ships are built on lines similar to those of the old clippers. Their speed under sail is somewhat inferior, but they are designed for greater proportional carrying capacity, and the numerous small and light sails, which added slightly to the speed and much to the cost of maintenance, are no longer fitted. A very large majority of existing sailing ships are built of wood, but steel is being used for many of the newer ones, as steel ships require less extensive repairs and carry more cargo on the same exterior dimensions. The lower masts and, in some cases, the upper masts and yards are of iron, while wire has almost entirely displaced hemp for standing rigging.

The sails, masts, and spars of sailing vessels are arranged in many different ways—in nautical language, the vessels have different rigs—and each particular style of arrangement has its own distinguishing name. The more common forms are ship rig, bark rig, barkentine rig, brig rig, brigantine rig, schooner rig, etc. Each principal type of rig has variations; thus, we have four-masted ships, four-masted barks and barkentines, schooners with topsail yards and others with as many as seven masts. The accompanying plate shows in detail the rigging of a modern full-rigged ship.

In the coasting trade of the United States large schooners (q.v.) have almost wholly displaced square-rigged vessels. They carry two to seven masts (two to four are most common), and the larger ones exceed in length and carrying capacity any of the old square riggers. The primary advantage of the schooner is the ease of handling her sails, whereby the size of the crew is reduced. Furthermore she lies closer to the wind than a square rigger. In nearly all large sailing vessels steam or other power, usually internal-combustion engines, is fitted to assist in handling sails and cargo.

Notwithstanding the improvement in sailing vessels, they are gradually being driven out of business by the steamer, which is able to handle freight more quickly, with greater certainty, and in many trades more cheaply. The sole hope that remains to the sailing ship lies in auxiliary propulsion by heavy oil engines. #### PER NAVIGATION

##### Development? Power-Propelled Vessels.

In a statement which was published in 1825 Tomás Gonzales asserted that in the year 1543 Blasco de Garay successfully propelled a vessel by steam in the harbor of Barcelona. About 30 years later the pairs in the case were examined by John McGregor, a Scottish lawyer and antiquary, who found that De Garay's apparatus consisted of paddlewheels turned by men. Some time later M. Bumroth made copies of all the documents concerning the experiments and claims, and they fully confirm Mr. McGregor's

DE CAUS' BOAT.  
From old drawing.

finding. In 1618 David Rumsey and Thomas Wildgoose patented an engine "To make boates for the carriage of burthens and passengers upon the water as swift in calms and more saft in storm than boats full sayled in greater wyndes." In 1630 David Rumsey (presumably the same as the foregoing) took out another similar patent. Salomon de Caus, a native of Normandy, said to have first thought of using steam for propelling boats in 1615. His ideas were ridiculed, and he was eventually imprisoned as a crazy man. In 1690 Prof. Denis Papin of Blois (France) described his invention of the steam cylinder in which the piston was driven by atmospheric pressure when the steam before it was condensed. In his remarks concerning its possible use he mentioned the propulsion of ships by *emi rotatiles* or paddle wheels. In 1707 he built a steamboat which he navigated on the river Fulda, but his success brought only ridicule and abuse; his boat was destroyed and he escaped to England, where he died three years later.

In 1698 Thomas Savary of London suggested the use of steam-driven paddle wheels, but made no effort to carry out his ideas. In 1729 Dr. John Allen took out a patent in England for a method of propelling a boat by means of forcing water out through the stern with steam or other pressure. In 1736 Joathan Hulls, a clock-maker of Campden, England, took out a patent for a stern-wheel boat driven by steam. His drawings and detailed descriptions of his inventions are extant, and he actually built a boat, though it failed to realize his expectations. In 1752 the French Academy of Sciences awarded a prize to the distinguished Swiss physicist Daniel Bernoulli for an essay upon propelling boats by steam, in which he recommended the use of a screw propeller. In 1775 the Marquis de Jouffroy began experiments with steam propulsion. Jouffroy's last steamboat was driven by paddle wheels and was so far successful that it continued to navigate the Saône for 16 months. From lack of means to develop his invention further he abandoned all work upon it.

Up to this time practicable steam navigation was impossible because a suitable steam engine did not exist. This deficiency was supplied by Watt, who took out his first patent in 1769,

[illegible]

# A FULL-RIGGED SHIP

but the engines contemplated were really single-acting pumps. Watt, however, had in mind their use for other purposes, for in 1770 he suggested driving vessels by means of his engines operating a screw propeller. In 1782 Watt brought out the double-acting engine and developed the principle of expansive working by cutting off the supply of steam at a suitable point instead of allowing it to follow full stroke. All the conditions necessary for the propulsion of vessels by steam were now in existence, and experimental boats rapidly appeared.

In 1784 James Rumsey exhibited a rude working model of a steamboat at Berkeley Springs, Va. It had a speed of about 3 miles an hour and was driven by the ejection of water through a tube at the stern. Later Rumsey built other models and boats, but none gave a speed of over 4 miles per hour. John Fitch's boats were fitted with various types of propelling devices. In 1785 he laid before the American Philosophical

MILLER'S BOAT.

Society of Philadelphia the descriptions and drawings for a proposed steamboat. In 1786 this boat was built, and trials were made with a screw propeller, a "screw of paddles," an endless chain of paddles, and paddle wheels, but without much success. A new boat, built in 1788, had paddles at the stern pivoted to an overhead frame. This boat made the trip of 20 miles from Philadelphia to Burlington in three hours and ten minutes—an average speed of 6.3 miles per hour—and may therefore be considered the first successful steamboat. Fitch built a new and larger boat in 1789, which, with side paddles, attained a speed of 8 miles per hour

CHARLOTTE DUNDAS.

and ran regularly as a passenger and freight boat on the Delaware River during the summer of 1790.

Patrick Miller, a retired banker of Edinburgh, for several years experimented with boat propulsion of different types in a lake on his estate of Dalswinton in Dumfriesshire. Paddle wheels turned by several men were tried in a race with a fast boat using oars, and the paddle boat won. Largely at the instance of James Taylor, a tutor

in his family, Miller engaged William Symington, a Scottish engineer, to fit his boat with steam power. A small boat (see illustration) was tried and gave such success that a larger one was built in 1789. In October of that year this boat attained a speed of 7 miles per hour on the Forth and Clyde Canal. In 1801 Symington was commissioned by Lord Dundas of Kerse to build a steamer for towing barges on the Forth and Clyde Canal. This was the celebrated *Charlotte Dundas*. Her machinery was far in advance of her time, and she was a success in all essential respects, but the proprietors of the canal refused to allow her to be used because they feared the effects of the wash from her paddles on the banks of the canal.

Nathan Read of Salem, Mass., built a successful paddle-wheel steamboat in 1789 and in 1791 patented the multitubular boiler. Oliver Evans of Philadelphia, Samuel Morey, and Col. John Stevens produced successful boats about this time or a little later. Stevens boats were numerous, and many were successful; one, built in 1804, had twin screws. Stevens completed the steamboat *Phoenix* in 1807, a few days after the *Clermont* started on her maiden trip. Not being permitted to operate in New York waters, she was used for a time to carry passengers on the Raritan River between New Brunswick in New Jersey and the city of New York. In 1809 she was sent by sea to Philadelphia and plied regularly on the Delaware for six years. Her speed was about the same as that of the *Clermont*, but the engines embodied many superior features.

The advent of Robert Fulton's *Clermont* marks the beginning of steam navigation as a commercial success. In 1797 Fulton (q.v.) went from England to Paris and soon afterward began experiments with submarine torpedoes and torpedo boats. About 1801 he secured the assistance of Robert Livingston, then the United States Minister to France, and they built a small steamboat. In 1804, as the agent of Livingston, Fulton went to England, where he ordered of Boulton and Watt the machinery for a much larger vessel, which was to be built in the United States. A hull; built in New York, was launched early in 1807, the engines were placed on board, and on Aug. 7, 1807, the *Clermont* started on her trial trip. Without stopping she proceeded to Clermont, the home of Livingston, on the Hudson, 110 miles away, and 20 hours later went on to Albany. The next day she started for New York and made the trip in 30 hours at an average speed of 5 miles per hour. Within a month she began to run regularly between New York and Albany.

The success of steam navigation in sheltered waters was now assured, and steamboats multiplied rapidly, especially in the United States. The first commercial steamboat in Great Britain was the *Comet*, built for Henry Bell. She was only 40 feet long (less than one-third the length of the *Clermont*), her beam was 10½ feet, and she had engines of three horse power, which gave a speed of 5 miles per hour. The British steam coasting trade grew rapidly and soon extended to the Continent, the first Dover-Calais line being started in 1820. In the previous year the Dublin-Holyhead service was begun.

#### DEVELOPMENT OF THE STEAMSHIP

The first steamer to cross the Atlantic was the American-built *Savannah*, of 350 tons and a

length of 100 feet, which crossed from Savannah to Liverpool in 25 days. In her, however, the engines were purely auxiliary; she was fitted with full sail power, and, when the wind was fair or the sea too rough for steaming, the

the company that owned her. In 1839 Samuel Cunard of Halifax, Nova Scotia, founded the Cunard line. Assisted by a liberal government subsidy, it was commercially successful from the start. The Cunard Company enjoyed a prac-

paddle wheels were unrigged and taken in on deck. She was followed in 1828 by the Dutch steamer *Curaçao* and in 1832 by the Canadian-built *Royal William*. The beginning of real transatlantic voyages under steam was made by the *Sirius* and the *Great Western*. The *Sirius* started on April 4, 1838, and the *Great Western* four days later. They arrived in New York within 24 hours of each other, on April 22 and

April 24, 1838. The *Sirius* was a tical monopoly of the transatlantic service until 1850, when the Collins (American) and Inman lines were started. The Collins lost two of its steamers, its subsidy was withdrawn, and it discontinued its service in 1858. Two other American lines were started in 1850, the New York and the Havre Steamship Company and the Vanderbilt line. Both ceased running at the beginning of the Civil War.

DIAGRAM GIVING CURVE WHICH SHOWS THE INCREASE IN LENGTH OF TRANSATLANTIC STEAMERS, 1840-1922. BASED ON THE LONGEST STEAMER IN SERVICE AT THE END OF EACH DECADE, OMITTING THE GREAT EASTERN.

23. The average speed of the *Sirius* was 161 miles per day—the highest 220 miles and the lowest 85 (half a day only); the amount of coal consumed was 450 tons. The *Great Western* averaged 208 miles per day, and her highest run was 247 miles. Neither vessel carried much sail.

For two or three years the transatlantic service was very irregular, chiefly because it was unprofitable. The *Sirius* was withdrawn after making a few trips, and, although the *Great Western* continued running, she lost money for

The Inman line was more successful. Though without a government subsidy at first, it had excellent mail contracts. It began its career with steamers built of iron and propelled by screws. Though no faster than the wooden paddle-wheel Cunarders, they were cheaper to operate. The screw propeller (q.v.) now began rapidly to replace the paddle wheel, though the Cunard Company launched the *Scotia*, their last and finest paddle steamer, in 1861. The rapid increase in the size of ocean steamships between 1840 and

1855 led to the production of the *Great Eastern* (q.v.), but she was half a century ahead of the demands of ocean traffic and the adequate development of marine engineering. She was fitted with both screw and paddle engines, as it was thought impossible for either separately to deliver sufficient propulsive effect. The combination was not an economical one and was a leading cause of her failure as a commercial venture.

In the fight for supremacy the screw had, by 1860, become the unquestioned victor over the paddle wheel so far as ocean navigation was concerned, both in the merchant marine and in naval construction. Its advantages for war vessels were numerous, but the greatest of these was the

than their predecessors of equal power, and they were also more economical. The first large vessel to be fitted with them was probably the *Protonotis*, which in 1874 was supplied with machinery designed by A. C. Kirk. By 1880 the use of triple-expansion engines became common, though compound engines were largely used for another decade, and they are still fitted in certain steamers where the conditions favor their economical working.

The capability of the water-tube type of boiler to furnish very high-pressure steam with ease and safety reacted upon engine design and produced the quadruple-expansion engine. This held its own for a time, but it is now very

DIAGRAM SHOWING RELATIVE DIMENSIONS OF THE LARGEST TRANSATLANTIC STEAMERS IN SERVICE AT THE END OF EACH DECADE FROM 1840 TO 1922 (GREAT EASTERN INSERTED FOR COMPARISON BUT NOT OTHERWISE CONSIDERED); ALSO OLYMPIC, LEVIATHAN (IMPERATOR), BERENGARIA (VATERLAND) AND MAJESTIC (BISMARCK).

possibility of placing all the propelling machinery below the water line; and this of itself was decisive. In merchant steamers the advantages of the screw are of a different kind. The draft and depth of lading of screw steamers are of less importance and can be varied within much wider limits without perceptible loss of efficiency; rolling produces little effect; and though pitching may be serious in short vessels in which the screw is not deeply immersed, yet, owing to the small ordinary angle of pitch, the screw rarely rises high enough above the surface to give trouble. The possible wide limits within which the size, pitch, and blade area of screws may be varied adapt them to the various types of modern engines, and the possibility of using several screws enables the power on a single shaft to be kept within practicable limits.

The demand for increased speed and reduction in weight of machinery for a given horse power led to still higher steam pressures and greater engine speed. The range of economical expansion in two cylinders being limited, the tricompound or triple-expansion engine was designed. The gain was twofold. The new engines were lighter

largely replaced by the turbine and other forms of steam and internal-combustion engines for reasons that are explained fully under SHIP-BUILDING, Machinery.

The length of the voyage and the vast amount of traffic have caused the transatlantic trade to be the principal field of steamship development. While the gain in size and speed of vessels in this trade has been continuous from the start, a great impulse was given by the building of the *Britannic* and *Germanic* for the White Star line in 1874. They at once reduced to about eight days the average length of passage from Queenstown to New York. They were followed in 1879 by the *Arizona* of the Guion line, confessedly built to outstrip all competitors, and her success was the beginning of a race for speed supremacy that culminated in the *Mauretania* and the ill-fated *Lusitania*, by which the average passage was reduced to less than five days, 4 days 10 hours and 41 minutes being made in 1910 by the *Mauretania* between New York and Queenstown.

The very fast express vessels of the Atlantic fleets added greatly to the prestige of the com-

panies building them, but they were not always profitable, and the rates for passengers and freight were high. Large vessels of less speed and much greater cargo capacity therefore began to be added to the great lines. The first of these were the steamers of the *Pennsylvania* class (13,000 gross tons) for the Hamburg-American Company, built in 1897, but the idea was more fully developed in the White Star *Celtic* (21,000 tons) in 1901. Other lines followed suit. The next step was the great jump in dimensions made by the White Star Company in the *Olympic* (46,000 tons) in 1910, soon followed by the Hamburg-American *Imperator* (52,000 tons) in 1913, after the war allotted to Great Britain and renamed *Berengaria*. In these vessels the speed was again increased, but not at the expense of carrying capacity, a feat rendered possible by increased dimensions and improved engine design. German shipbuilders then essayed the *Vaterland* of even greater length, completed in 1914, but later in that year interned in the United States and in 1917 reconditioned as an American transport to be named the *Leviathan*. Likewise the opening of the war found the *Bismark* awaiting completion on the

ways. This vessel, almost a sister ship of the *Vaterland*, was completed, and passing into British possession was in 1922 the largest passenger ship in service. No attempt had been made up to 1922 to rival the *Mauretania's* records, in fact that vessel herself when fitted for oil burning after the war developed greater speed, but geared turbines and steam-electric propulsion (see SHIPBUILDING, *Machinery*)

of the development the *Great Eastern* should be omitted, as she was not built for this trade and was, as regards size, 40 years ahead of her time. She is included for purposes of comparison.

The introduction of internal-combustion engines for marine propulsion is a comparatively recent achievement. For years only gasoline engines were used to any extent for this purpose, and they were employed almost exclusively in small craft. About 1910 Diesel heavy-oil

their growing shipping was rendered of no avail, and was forced to tie up either in neutral or home ports. On the other hand the great merchant fleets of Great Britain enjoyed a wide freedom of the seas except, and the exception was a very large one, when interfered with by the German submarines, and consequently the British Isles, France and Italy were not cut off as were the Central Powers. Furthermore, great opportunities were offered the neutrals

<sup>1</sup> Net tonnage.

engines began to be fitted in larger vessels. They have given fair satisfaction for horse powers up to 2000 in single engines, and larger engines are projected. They have been applied to submarines for surface running. See *TORPEDO BOAT SUBMARINE*. See also *COMMERCE*; *GREAT EASTERN*; *MEASUREMENT*; *MERCHANT MARINE*; *SAFETY AT SEA*; *SHIPBUILDING*.

The outbreak of the World War in August, 1914, naturally had a serious effect on shipping

for the transportation of munitions and other supplies to the Allies and the returns to shipping were so large that serious risks were readily taken, and every effort was made to increase the tonnage available for such commerce.

By an act of the United States Congress, Aug. 18, 1914, a radical change of policy was inaugurated permitting the transfer to the American Flag and Registry of vessels of other nations. This condition was comparable with that

## THE NUMBER AND GROSS TONNAGE OF U. S. SHIPPING BOARD AND OTHER BRANCHES OF AMERICAN SHIPPING AT THE BEGINNING OF EACH FISCAL YEAR INDICATED

From *Report of Commissioner of Navigation*, 1921

July 1—	Seagoing				All other		Total	
	Shipping Board (1,000 gross or over)		Private owners (500 gross or over)					
	No.	Gross tons	No.	Gross tons	No.	Gross tons	No.	Gross tons
1917.....	19	76,160	1,552	3,564,160	24,826	5,230,717	26,397	8,871,037
1918.....	235	930,058	1,649	3,813,325	21,827	5,172,135	26,711	9,924,518
1919.....	982	3,827,203	1,676	3,927,651	21,855	5,152,446	27,513	12,907,300
1920.....	1,630	6,903,128	1,774	4,375,613	21,779	5,005,283	28,183	16,324,024
1921.....	1,798	7,993,771	1,925	5,240,630	24,286	5,047,735	28,009	18,282,136

and commerce, and the practically unrestricted use of the submarine by the German government introduced new conditions giving rise to unusual hazards. There resulted the inevitable destruction of shipping, and naturally attempts at its replacement when possible. No war previously had ever been fought on so large a scale, and where eventually almost all the leading maritime nations of the world were involved. The Central European Powers had been dependent, more or less, on raw and other materials imported from overseas, and then by virtue of the blockade established by the Allies

existing in 1863 and 1864, when 523,064 tons of American shipping was sold to European owners to escape risk of capture by the Confederate cruisers. On the other hand in the fiscal year, 1915, 148 vessels of 523,361 gross tons were transferred from other nations to the American Flag and Registry. Of these 96 ships, 332,258 gross tons were formerly under the British Flag, 30 ships and 147,742 gross tons were under the German Flag. In many cases, however, these transfers did not involve any change in the actual ownership as they belonged to Americans who operated under foreign flags

and registry on account of the superior advantages thus enjoyed. They were said to represent an investment of \$3,339,327,558, and this additional tonnage gave to the United States for the first time in many years second place in the foreign overseas trade of the world. Such transfers, however, were not favored by the European governments and regulations or statutes were put in force in Great Britain, France, and Germany for bidding or regulating the transfer to enemies or even to neutrals.

The new conditions naturally led to a revival of shipbuilding in the United States which was felt during the early months of 1915. On July first of that year 46 vessels of a net tonnage of 282,718 tons were building and under contract in American yards, and by the end of the year further orders had been given for 52 vessels with a gross tonnage of 323,602 tons. The merchant marine of Germany and Austria, early in the war, had been driven from the seas, and destroyed or forced to return to their own or neutral ports, so that over 6,000,000 tons were rendered useless. In Germany during the war the activity of the shipyards was focused largely on the construction of submarines.

In 1915 the Congress of the United States enacted a statute of far-reaching importance, namely, the La Follette Seaman's Law, which came into effect for American ships on Nov. 4, 1915, and for foreign vessels on March 4, 1916. This Act required that 75 per cent of the crew on American-owned or operated ships should "understand any order given by the officers of such vessels," and that 65 per cent of the deck crews employed on American vessels ultimately should be able seamen, qualified and examined by government officers. This Act made the offense of desertion by members of a ship's crew much less serious, required one-half payment of wages of the crew in every port and provided for the refusal of clearance to a vessel where regulations had not been complied with.

In the United States the shipyards became active and the output for the calendar year 1916 for private shipyards was 614,214 gross tons; 1213 vessels of 560,239 gross tons, an amount which could be compared with the record of 614,216 in the fiscal year 1908, and also that of the fiscal year 1855 when 583,450 gross tons were built. At this time the United States began to build extensively for foreign owners, mostly Scandinavian, who while they suffered great losses, were constantly replacing and increasing their fleets as they secured valuable profits in maritime commerce.

On Sept. 7, 1916, after a long struggle in Congress, the so-called Shipping Act became a law, being a compromise measure passed only after a bill looking towards direct government ownership had been defeated. This Shipping Act established a board of five members who were authorized to procure by purchase or construction cargo ships to the value of \$50,000,000, and set them to work on carrying American merchandise to foreign countries, and to regulate the rates and general business practise of the American Merchant Marine, much as was done by the Interstate Commerce Commission for the land.

The Emergency Fleet Corporation now was established by the United States government on April 17, 1917, under the provisions of the Shipping Board Act of the previous year. The duty of this corporation was to develop im-

mediately a large commercial merchant marine of standardized and other ships in the shortest possible space of time. The first contract for new construction was let on April 27, 1917, and work was begun in earnest, but the work of the Shipping Board and the Emergency Fleet Corporation straightway became a storm centre of controversy. The Emergency Fleet Corporation undertook the construction of a vast building programme and at the end of the calendar year 1917, there were 1427 vessels under construction in 132 shipyards, while in the fiscal year some 800,000 tons of merchant ships had been completed.

Prior to 1916 the total shipbuilding capacity of the world, including Germany and Austria, was approximately 3,685,000 tons, and the total production of ships in all the world in 1917 was approximately 3,250,000 tons. The United States Shipping Board in the projects it started proposed that by the end of 1919 there would be constructed a grand total of approximately 9,600,000 registered tons in addition to the enemy tonnage seized when the United States entered the war, and that of neutrals commandeered. By November, 1917, the Emergency Fleet Corporation had let contracts for 484 new vessels aggregating 4,724,300 tons of deadweight, and there were contracts pending for 99 vessels of 610,000 tons in addition to the further output of 426 vessels of 3,029,508 tons requisitioned on the ways.

One of the features of the work of the Emergency Fleet Corporation was the award of contracts for the construction of fabricated ships, defined as "a ship on which the work of punching and shaping the plates and shapes, to some extent, assembling and riveting, is done in a fabricating shop, ordinarily employed for bridge or tank work, as distinct from the usual practice of doing it in the shipyard punch shop." For the construction of these fabricated ships Hog Island plant of the American International Shipbuilding Corporation, near Philadelphia, and the Newark Terminal plant of the Submarine Board Corporation were established by government subsidy, while the Chester Shipbuilding Company of Chester, Pennsylvania, and the Merchant Shipbuilding Corporation at Bristol, Pa., the Federal Shipbuilding Company at Kearny, New Jersey, and the Chickasaw Shipbuilding Company at Chickasaw, in Alabama, near Mobile, were also engaged in the manufacture of fabricated ships.

In the meantime the United States had taken over 109 German ships and as in many cases hulls or engines had been damaged, the repair of these craft was an important work for American shipping building yards. Notable in this repair work was the rehabilitation of the former German *Vaterland* which became known as the *Leviathan*, and along with other German craft was active in the transport of American troops to Europe.

But the way in which the American shipbuilding programme was conducted was far from satisfactory, and there were changes in the personnel of those in authority. During 1918 the Emergency Fleet Corporation to which Charles M. Schwab had been called as general manager, made remarkable progress. On Jan. 1, 1918, it had 157 ships on the ways, and 55 in the basin, or a total of 212 with a deadweight tonnage of 1,476,185. At the end of the year there were 420 vessels on the ways, 132 in the basin, making 552 with a deadweight tonnage of

3,658,575 tons, or over 148 per cent increased production over the previous year. The actual deliveries during 1918 were 423 ships of 2,675,202 tons of deadweight tonnage. During this year fabricated ships were launched and completed, and work proceeded actively until the Armistice.

After the conclusion of the Armistice it was but natural that some reckoning should be made of the amount of tonnage that was lost through enemy action and marine risks during the conflict. It was stated that 9,031,828 gross tons of British shipping and 6,021,958 gross tons of other Allies and neutral nations, or a total of 15,053,786 gross tons had been destroyed, and inasmuch as the world's merchant tonnage on June 30, 1914, totaled 49,089,552 gross tons, or 73,634,328 deadweight tons, it would appear that nearly one-third of the world's merchant shipping had been lost. Summed up somewhat differently by the United States Shipping Board in deadweight tons, it was stated that the total losses of allied and neutral powers from Aug. 4, 1914 to Sept. 1, 1918, were 21,404,913 tons, while total construction by the same nations in the same period was 14,427,825 tons. There was captured from the Germans by the enemy 3,795,000 tons, so that the excess of losses over gains was 3,362,088, while the estimated normal increase in the world's tonnage based on the rate of increase for the previous decade would have been 14,700,000 tons, so that the net deficit in shipping, due to the war, was 18,062,088 tons. The losses of the United States merchant marine during the war, included 74 steamers and 73 sailing vessels, the steamers having a total tonnage of 329,053 and the sailing vessels a total tonnage of 61,129.

Naturally in 1918 the United States Shipping Board and the Emergency Fleet Corporation had their most active period of functioning during the war. The Shipping Board had operated practically the entire American Merchant Marine as a national enterprise, and its functions were (1) the acquisition of vessels (2) the operation of vessels and (3) the regulation of shipping and shipbuilding. The American Army and its supplies had been transported overseas by the combined efforts of the United States and its allies, and a vast merchant fleet was called into being. This presented problems in peace quite as serious as those of war. The war had developed shipbuilding as one of the greatest of American industries, and in 1919 for the second time in its history the United States took first rank among the shipbuilding nations of the world, contributing new tonnage stated as 4,075,385 gross tons, or 57 per cent of the world's total for the year. War conditions had made the construction of the American Fleet unique in method and circumstance. Speed had been the prime essential and labor costs had mounted to an extraordinary degree. With the war out of the way the next question was the utilization of the fleet and the completion of vessels that were under way or planned. In Great Britain, in 1919, more effort was spent in reconditioning the older or damaged ships than in new construction, but, nevertheless, some important vessels were launched and the country hoped to regain its preëminence on the seas.

In January, 1919, the United States Shipping Board ordered all requisitioned ships, except those needed by the war and navy departments, to be returned to their owners, but this policy

was delayed in execution some months, as many of the vessels were engaged in moving food-stuffs to the suffering peoples of Europe. With the return of privately owned vessels, however, freight rates dropped from war-time prices, and for a while the industry was very profitable. The ships built and owned by the United States government were allocated to various American operators who received a percentage of the gross freights for their services in management and operation and a number of shipping companies were formed for this purpose. The year 1919 was a period of great activity as Europe required large amounts of supplies, and at the same time there were imports to the United States on a large scale. On Dec. 20, 1919, the first American passenger service to Germany was inaugurated when the *Manchuria* cleared for Hambourg. Up to June 30, 1919, the expenditures of the construction division of the Shipping Board had aggregated \$2,512,692,000, of which \$1,741,997,945 were expended during the fiscal year ending June 30, 1919, or at the rate of about \$150,000,000 a month.

In 1920 after this period of activity, the shipyards of the world showed a decrease of almost 1,300,000 gross tons over the 1919 figures, but an increase of more than 400,000 tons over 1918, the difference being in large measure due to the decrease in the American shipbuilding programme. Nevertheless in this year there was a distinct gain over prewar building, particularly in the United States and Great Britain, though towards the end of the year a decline set in which continued during 1921. Examination of the statistics revealed, though, that Great Britain at this time was reëstablishing its place as the leading shipbuilding nation of the world, and also that the continental nations and Japan were resuming activity in their shipyards.

The increase in registered, enrolled, and licensed tonnage in the United States continued and on June 30, 1920, the total was 16,324,024 gross tons, three times the tonnage in 1914 of Germany, whose former place as the second maritime power was now assumed by the United States. With the increase of available tonnage it was but natural that American ships should carry more of the country's commerce than ever before, and in 1920, \$3,116,352,644 of the total of \$7,145,448,264 of exports or more than 43 per cent was transported under the American flag. During the fiscal year 1914 American ships handled 9.7 per cent of the total foreign trade which was then \$3,785,468,512.

In 1920 the United States Shipping Board continued to be a storm centre both as regards its policy and its demonstration. It had sought to develop an elaborate organization fostering trade, and its vessels were generally available, but at the same time there was a large amount of war-built vessels for which there was no work and extraordinary expenses so that on the Shipping Board's balance sheet, June 30, 1920, the operating expenses exceeded the income by more than \$500,000,000,000. With a decline in commerce the situation grew worse rather than better, and in 1920 and 1921 there was a vast amount of shipping tied up awaiting purchase or charter.

The old condition that American ships could not be operated as cheaply as European or Oriental craft, again came to the fore and there followed now a decline in American shipping as well as in shipbuilding. Naturally unsatisfactory con-

ditions led to further legislation, and the Merchant Marine Act of June 5, 1920, known as the Jones Law, provided for the continuance of the United States Shipping Board with the partial recognition of the principles of American subsidies. The act also provided for loans to shipowners for new construction from funds received from the sale of government-owned ships and for receipts from their operation, an amount not to exceed \$25,000,000.

Among the provisions of this act was a section which sought to remove any restriction on the United States to impose discriminating duties against foreign ships by terminating any ordinance, any treaties or conventions, and directed the President to give 90 days' notice of such action. This act also dealt with ship mortgages with the aim of making a vessel mortgage a prior lien to that of the materialmen. President Wilson refused to issue such a proclamation on constitutional grounds, and he was followed in this action by President Harding, but the United States was by no means out of its troubles as regards shipping and with the decline of commerce was left with a large number of vessels on its hands for which there was no market, either for sale or for operation. During 1921 considerable attempt was made to bring conditions back to normal in all the leading countries of the world, but there was a lack of cargoes and trade conditions generally were unsatisfactory. The war had demonstrated clearly how much the nations of the world owed to their merchant shipping, and the familiar slogan that "ships will win the war" was amply borne out in the facilities provided for transporting American men and ammunition across the seas.

With increased economies in operation, due to oil burners and internal combustion engines, it was believed shipping would flourish wherever it was not interfered with by hostile legislation and wherever there was adequate trade for its support. Australia had tried government owned and operated ships, but the experiment was not as clearly defined as in the United States where aside from its war usefulness government ownership and operation was considered a distinct failure on the score of expense and lack of efficiency.

#### CLASSIFICATION OF SHIPS FOR MARINE INSURANCE

This is a work performed by private registration societies. These were first formed by

the underwriters for their own protection to secure a registry of all ships applying for insurance in which would be recorded such information as might be necessary to guide them in granting insurance. The character of the information gradually broadened until the data recorded included full particulars in regard to the vessel's hull, machinery, and equipment, ownership, master, builders of hull and machinery, etc.

From the information so obtained, from experience gathered through inspection and survey of vessels in all stages of construction and operation, and from other sources the societies have been able to formulate rules for construction, equipment and operation. The rules for construction give the necessary features of design to secure the highest classification and the minimum rates of insurance. They also give in great detail the character, quality, and strength of materials; the scantling of parts of the ship's structure; the methods of lapping, butting, and calking; size, spacing, and character of rivets; the fitting of bulkheads, bulkhead doors, bottom and double-bottom plating; spacing of frames, beams, etc.; character and number of pumps, anchors, chains, etc.; character of rudder and steering gear; details of the machinery and boilers for different powers and steam pressures; and a schedule of necessary auxiliaries and their capacities. Plans of new vessels are submitted to the society. After approval the local surveyor oversees the work. The classification of the vessel upon her completion is based on the surveyor's report, occasionally supplemented by a special survey. Nearly all recent editions of the books of rules and tables of the various societies provide for steel construction only, but the old rules are in force (with some modifications) for iron, wood, and composite vessels, and they are still classed. See article on A1.

The oldest registration society is the Bureau Veritas, founded in 1828. Its headquarters are in Paris. The highest classification assigned is designated by the following symbols,  $\star$ I 3/3L I.L., in which  $\star$  indicates special survey; I that the vessel is in all respects of the I (i.e., first) class, and a circle shows that the number of water-tight compartments is sufficient to insure flotation in still water with one compartment open to the sea—two rings would indicate that two compartments could be flooded without causing disaster; 3/3 that the hull and machinery are excellent—a letter following this symbol denotes the navigation for which the vessel is intended; the first I of the last group signifies that the wooden parts of the ship are satisfactory and the second I that the equipment is equally so.

Lloyd's Register succeeded two older societies in 1834, and others have since been merged into it. It is by far the largest of all the registry societies in scope and number of vessels classed. Its headquarters are in London. The symbols designating the highest classification are  $\star$ 100A 1  $\star$  L.M.C. The Maltese cross indicates special survey; 100A indicates conformity with rules as regards the hull; 1 shows efficiency of equipment; L.M.C. that Lloyd's machinery certificate has been issued.

The British Corporation dates from 1890. Its headquarters are in Glasgow. The symbols for highest classification are B.S.  $\star$  M.B.S.  $\star$ , in which B.S. indicates that the hull and equip-

ment conform to the British standard and M.B.S. that the machinery also conforms to it. The star \* indicates special survey.

The Record of American and Foreign Shipping was established in 1867 by the American Bureau of Shipping (then called the American Shipmasters Association). Its rules have received the approval of the United States government and of different boards of underwriters and constitute the standard American authority, the Merchant Marine Act of 1920 providing specifically for the recognition of the American Bureau of Shipping. An annual record is published. The classification symbols are \* A1 M.C., in which the Maltese cross indicates special survey; A1 indicates conformity of the hull and equipment with its rules, and M.C. that a machinery certificate has been issued.

The Registro Nazionale Italiano has its headquarters in Genoa. In 1910 it succeeded the Registro Italiano. Its rules are the same as those of the British Corporation.

The Germanischer Lloyd was established in 1867. Its headquarters are in Berlin, and the number of ships classed is about 3000. The symbols for highest classification are \* 100A \* M.C. The Maltese cross has the usual signification of special survey; a rectangle about it shows that the water-tight-compartment system ought to insure flotation with one or two compartments flooded; the signification of the group 100A is that the hull and equipment conform to the highest requirements; the figure 4 signifies that the vessel is to be resurveyed at the end of four years, when, if satisfactory, the classification will be renewed; M.C. denotes that a machinery certificate has been issued.

The Norske Veritas was organized in 1864, and its headquarters are in Christiania. The number of ships classed is about 1600, and the symbols of highest classification are \* 1A1 1 \* M. & K.V. The first group, 1A1, indicates excellence of hull; the next figure, 1, that the equipment is equally satisfactory; and the last group, M. & K.V., that an engine and boiler certificate has been issued.

**SHIPBUILDING. History.** The simplest form of floating craft designed to support and transport men or objects is the log; the next step is the raft; then the dugout, or log hollowed out; the hollowed-out principle being established, the canoe of bark or skins stretched upon light frames naturally followed when lightness was a matter of importance. To secure increased size the dugouts were split and additional planks inserted between the sides to form a broader bottom, the next step naturally being the construction of a vessel of planks sewed together with ropes or held together with wooden pins and braced by light interior frames. The next form was that of a vessel in which the planking was attached to strong frames by wooden pins or metal fastenings; when this point was reached the larger craft had whole or partial decks. Lastly we have the iron or steel ship of the present day.

The earliest Egyptian drawings show boats constructed of sawn planks and having sails as well as oars. Though these are the most ancient large boats of which we have positive knowledge, and although they were large enough to carry a great many men, they were designed for use on the Nile and not for traversing the open sea, for the Egyptians were not a seafaring race. The

Chaldeans seem to have been navigators and shipbuilders, but it is certain that to the Phœnicians belongs the principal credit for the development of the ship. As early as 900 B.C. the Phœnician war galley had reached the trireme stage and had decks, masts, yards, stays, sails, a ram, etc. The war galleys differed from those used for carrying merchandise in being longer, faster under oars, generally larger, and probably less seaworthy.

Among the ships of the ancients there were many of great size, but it is doubtful if they were strong enough to have gone to sea in the modern sense of the expression. They were chiefly used for harbor service or as house boats, and, though some were fitted as men-of-war, it does not appear that they were ever in action. One great ship, of which the dimensions are not precisely known, was built for Hiero II, King of Syracuse, under the direction of Archimedes. Though the descriptions are not very clear, she seems to have been copper-fastened and sheathed with lead laid over cloths soaked in pitch. She was presented by Hiero to Ptolemy Philopater soon after completion; her further history is unknown. The ordinary trireme galley was probably 110 to 140 feet in length (including the beak) and had a breadth of 14 to 18 feet. This size seems to have been the general favorite throughout the galley period. As ramming was one of the principal methods of attack, speed, weight, and handiness were of prime importance, and these were better combined in the trireme than in vessels of greater or less size. With merchant vessels the conditions were somewhat different. Merchant galleys used their sails much more and had less imperative need of speed. They were therefore broader in proportion to the length.

As the use of sails became more common and they were better fitted, ships began to increase in average size, the advantage of speed and power being with the larger ones. As soon as the sea power of Venice began to wane the great centres of shipbuilding changed from the Mediterranean to the Atlantic, the North Sea, and the Baltic. William the Conqueror invaded England in very small vessels, but 100 years later English ships of considerable size were in use. King John established a royal dockyard at Portsmouth. Early in the fourteenth century the use of large sailing ships and of the mariner's compass had become general. In the reign of Henry VIII ship construction was much improved, and ships began to take on much of the form which they have preserved to the present day. During the next four centuries improvements of design and construction were continuously made until the wooden sailing ship reached its culminating point in the clipper ship of the nineteenth century. See NAVIES; SHIP AND SHIPPING.

#### THEORY AND DESIGN

So long as ships depended upon sails for propulsion, shipbuilding remained a mechanical art bound by rules, traditions, and dogmas which were the result of centuries of experience. But with the advent of steam came the general scientific awakening, and shipbuilding received its due share of attention. Its theoretical side has been given the name of naval architecture.

For convenience we may divide the subject into three principal parts, viz. (1) design as it affects the buoyancy, stability, steadiness, sea-

worthiness, etc.; (2) design as it affects the efficient propulsion and manœuvring powers; (3) design as regards the strength, habitability, and general structural arrangement.

A vessel floating freely in still water displaces a volume of water equal in weight to its own, and the weight is called the vessel's displacement. This weight is supported by the pressure of water, which acts at all points perpendicular to the surface of the ship's bottom; but the sum of the vertical components of the water pressure at all points must balance the weight of the ship, and this sum is termed the buoyancy. The total weight of a fully loaded ship may be divided into the weight of hull and the weight of lading. The latter represents her carrying power or useful displacement, and it is of course desirable to make this as large as possible (compared to the weight of the hull), consistent with other necessary requirements. The reduction in hull weight is the principal cause of the substitution of iron for wood in shipbuilding and, in turn, the displacing of iron by steel.

In considering ships of different forms it is useful to know something definite concerning their shapes without exhaustive examination, and this is obtained by comparing them with the parallelepipedon, which has dimensions equal to the length ( $L$ ), breadth ( $B$ ), and mean draft ( $M$ ) of the ship. If  $v$  = the volume of the ship and  $V$  the volume of the parallelepipedon, we have  $\frac{v}{V} = C$  = coefficient of fineness of the ship.

If  $d$  and  $D$  are the corresponding displacements (i.e., weights) in tons, since 35 cubic feet of sea water weigh a ton,

$$C = \frac{d}{D} = \frac{d \times 35}{L \times B \times M}.$$

This formula takes no account of the shape of the midship section of the ship, in which there is considerable difference in vessels of the various types. A bluff vessel might have a high rise of floor, and a fine-ended ship a nearly rectangular midship section, and yet the coefficient of fineness be the same. To obviate this uncertainty the prismatic coefficient is used. In this case the volume of the ship is compared to the volume of a prism, whose length is the length of the ship, but whose base is the midship section of the ship. If the area of the midship section is  $A$ , we have prismatic coefficient, or coefficient of water lines as it is commonly called  $= C' = \frac{d \times 35}{A \times L}$ .

In modern steamships the midship section closely approaches a rectangle, and the ordinary coefficient of fineness suffices. For steamers of exceptionally fine form (particularly those with no parallel midship body) the coefficient is from 40 to 50 per cent; in large fast steamers, 45 to 55 per cent; in recent battleships, 55 to 65 per cent; in low-speed cargo steamers, 65 to 78 per cent. The coefficient of water lines is greater and varies from about 55 to 83 per cent in value.

In referring to the displacement of a ship it is necessary to specify some particular condition, as of course the displacement varies with the loading. With men-of-war the condition commonly used is that of normal or mean-load draft. That is supposed to be the average cruising condition, but is usually somewhat less. The deep-load condition for a man-of-war is when her full supply of stores are on board and her coal bunkers are full. For merchant ships, displacement

is only beginning to be used, and it is generally given for a light-load condition—when the ship is practically empty—or when she is immersed to her Plimsoll mark (see LOAD-LINE MARKS OF VESSELS); it may also be given for a specific mean draft of water. The tonnage of ships is a measure of capacity for cargo and is fully treated under MEASUREMENT OF SHIPS FOR TONNAGE.

After considering the volume of displacement of ships, the next point to be examined is the shape of the volume as regards stability and steadiness. These two expressions are linked together in the minds of many people as if they were convertible terms. Instead of being so they are in a measure antithetical, as we shall presently see. When a vessel is at rest in still

FIG. 1.

FIG. 2.

water it is evident that her centre of gravity and the centre of gravity of the volume of water she displaces (which is called the centre of buoyancy) must lie in the same vertical line, for only in that condition will the forces of weight and buoyancy act in exactly opposite directions and produce equilibrium. The relative positions of these points are shown in the accompanying diagrams, in each of which  $G$  is the centre of gravity of the ship and  $B$  the centre of buoyancy.

If the ship is made to roll, the position of the centre of buoyancy will be displaced, as shown in Fig. 3. We have then a force acting vertically upward at  $B'$  and a force working vertically downward at  $G'$ , producing a couple tending to turn the ship back to her upright position. Similarly, if the ship pitches, the centre of buoyancy

FIG. 3.

is displaced longitudinally, and the couple acts as before. In either case, if  $W$  is the weight of the ship in tons, the moment of this couple is equal to  $W \times G'H$ , or  $W \times G''H'$ . If a vessel rolls and pitches at the same time, the centre of buoyancy will be displaced both laterally and longitudinally, and the couple will then tend to act in a plane, making an angle with the keel which is greater than 0 and less than 90 degrees. If a ship is pressed over by a constant force, such as the wind or the action of the rudder, and the surface of the water is smooth, the righting moment is simply that of the couple. But if the surface of the water is broken by waves, the shape of the submerged body is constantly changing, thereby moving the centre of buoyancy and adding to or subtracting from the righting force due to the couple.

When a ship is forcibly inclined in still water the point  $M$  (Fig. 3), called the transverse meta-

centre, is the point in which the vertical line through  $B'$  cuts the line  $G'M$ , which is vertical when the ship is upright; and the distance  $G'M$  is called the transverse metacentric height. Similarly in Fig. 4,  $M'$  is the longitudinal metacentre, and  $G''M'$  is the longitudinal metacentric height. In vessels of ordinary type  $G''M'$  is so large that there is practically no danger of their turning end over end unless they are very small.  $G'M$ , however, is often very small, and its value must be very carefully considered. Being so much used, it is commonly referred to as the metacentric height. The determination of it is effected by inclining the ship in still water. It changes for every change in the position of the centre of buoyancy, but for angles not exceeding 15 degrees the change is slight. The value of

FIG. 4.

the metacentric height usually given in tables is, therefore, that obtained by inclining the ship through a very small angle.

The rolling of a ship, when forcibly inclined in still water and then allowed to right herself, is like that of a pendulum which has been drawn to one side and then permitted to vibrate until it comes to rest. Acted upon by the couple (the moment of which in this case is called the moment of statical stability), she rapidly reaches the upright position at a constantly varying angular velocity. As soon as this position is reached the couple ceases to act, while her momentum causes the roll to continue; but beyond the upright position a couple in the opposite direction is formed, and this (together with friction and wave making) gradually checks her roll until it ends, whereupon the new couple sets up a roll in the opposite direction just as a pendulum returns in its vibration. The rolling continues, though the arcs are smaller and smaller each time, until the vessel comes to rest in stable equilibrium in the upright position. The oscillations of a pendulum in vibrating are performed in equal periods of time, irrespective of their amplitude; and this is practically true of the ship, though the wave making due to the high angular velocity of deep rolls and the increased friction due to greater area of immersed surface cause some variation. The mean length of time required for a ship to make a complete double roll through a moderate angle in smooth water is called the still-water period. In rough water this period is modified by the action of the

waves, which gives a constantly varying value to the total righting moment. If the waves pass under a ship in such a way as to add to this moment when the ship is rolling towards the vertical and reduce it when she is rolling away from the vertical, a dangerous condition of affairs is produced which may result in her capsizing. This condition can exist only when the wave period (time between waves) is practically the same as the ship's still-water period; when it does exist the course of the ship with reference to the waves should be materially changed.

Since the righting moment is the force which makes a ship roll, it is evident that if this force is powerful the ship will roll quickly and perhaps deeply, neither of which is desirable. To reduce the time of rolling (i.e., the still-water period) the metacentric height may be reduced as much as is consistent with safety, or the weights in the ship may be moved away from the midship plane if practicable, at the same time preserving the same height of centre of gravity. To reduce the amplitude of the roll, and therefore its angular velocity, the best means so far devised is the bilge keel (q.v.) or rolling chock. Horizontal, thwartship water chambers with a central dam or several dams, and partly filled with water, are useful to reduce small angles of roll, but the noise and shock of the moving water is so objectionable that they have not been adopted. The latest device for the reduction of rolling is the gyroscope, which has been fitted in a number of small vessels and has given

good results. Its availability for use in large ships is yet to be determined. Vessels are designed to have a certain metacentric height under various conditions of loading, and the stowage of cargo should, as far as possible, be so arranged as to give proper value to the righting moment. Vessels with double bottoms may, within small limits, vary their righting moments by filling or emptying double-bottom compartments.

To secure seaworthiness, vessels must not only be sufficiently stable at all moderate angles of roll, but they must be stable at all possible angles. The range of stability is independent of the force of the righting moment and varies in different classes of ships. In battleships and large vessels it usually reaches 70 degrees of inclination on each side of the vertical; for small vessels, such as torpedo boats, the range is usu-

FIG. 5. DIAGRAM SHOWING USE OF WATER-BALLAST TANKS IN A MERCHANT STEAMER.

The shaded portion indicates ballast tanks.

ally greater. Seaworthiness further requires a reserve of buoyancy, i.e., only part of the hull below the upper deck must be submerged, and the openings in the hull must be capable of being closed in rough seas. (See SAFETY AT SEA.) Comfort and health require that the sides of the ship, and particularly the bow, should be high above the water; without high sides a vessel can be kept at sea for a short period only.

The second part of the subject relates to effi-

cient propulsion and manœuvring power. In this we must consider the shape and smoothness of the hull as regards resistance to its movement through the water. The total resistance is made up of three parts: (a) frictional resistance; (b) eddy-making resistance; (c) wave-making resistance.

Frictional resistance is due to friction between the water and the hull of the ship. It does not depend upon the shape of the hull to any appreciable extent, but upon its smoothness, the area of the wetted surface, the length of the ship, and the speed. It forms the greater part of the total resistance of a ship moving at low speeds and an important part of it at all speeds, particularly if the bottom is rough or foul. For any given ship it varies about as the square of the speed. The difference in resistance between a smooth and a rough bottom is very great. A smoothly painted bottom has only half that of one of the roughness of fine sandpaper and only about a third of that of coarse sandpaper. The difference in the power required to drive a ship when her bottom is foul and when her bottom is clean is then very easily appreciated.

Eddy-making resistance is not usually important in well-designed ships and ought not to exceed about 8 per cent of the frictional resistance. Eddies are chiefly to be found at the stern, where the water rushes in behind the ship. If the run is long and fine, the speed moderate, and the propeller struts, rudder, etc., well designed, they are scarcely noticeable; but a ship with too short a run, badly designed rudder, propeller struts, etc., leaves at full speed a boiling, troubled, eddying wake behind her.

Wave making is in many respects the most important part of the resistance of ships, for it is the one over which we have the most control and which is the greatest impediment to high speed. The laws which govern it are not yet fully understood, but the character of the waves and the losses entailed by them have been very carefully examined. A ship moving through undisturbed water puts certain particles of it in motion, carrying some along with her by friction and giving motion to others in such a way as to cause them to rise in waves. All the energy taken up by the water must come from the propelling machinery, and if it is not returned to the ship in pushing her ahead, it is wasted.

The entrance of a ship is the tapered forebody which extends from the stem to the point where her hull has obtained the full dimensions of the midship (or maximum) section, and the run is the corresponding tapered portion of the afterbody. These two parts of a vessel are termed the wave-making features because the movements of the particles of water forming waves depend upon their lengths and shapes. A vessel passing through undisturbed water forms a double series of waves at the bow and at the stern. The former are most readily seen, largely because the action of the screw tends to degrade and confuse those at the stern. One set of waves are called divergent because their crests make an angle of 40 to 50 degrees with the keel; the other waves are called transverse because their crests are perpendicular to the keel line of the ship. Both sets increase in height with the speed, and this height is a measure of the energy absorbed by them and indicates the speed with which they are traveling. The divergent waves are thrown off and, leaving the ship, no longer influence it, but the transverse waves move at the same speed

as the ship and keep their crests and hollows at about the same points on her sides so long as the speed is constant. Furthermore the length between crests is the same as between the crests of ocean waves moving at the same rate of speed. It is found that if a wave crest is maintained at about the middle of the run the wave making is decreased, but if a wave hollow exists there the wave-making resistance is increased. Some of the variations in power required to drive vessels at different speeds may be due to this cause.

A study of the behavior of models and of full-sized ships of different designs and under different conditions has shown that for every design there is a certain critical speed below which wave-making resistance increases quite regularly and moderately, but beyond which it increases with great rapidity. It is further shown that the greater the length of the entrance and the run the higher is this critical limiting speed. It was at one time supposed that of two designs of equal length and displacement that with the least midship section would give the least resistance, but experiment has shown that this is not necessarily the case. If two designs of equal length and displacement are tested, one having fair lengths of entrance and run and considerable length of parallel middle body, and the other having no parallel middle body and a much greater beam, but tapering from the midship section to the bow and stern, the latter will have the higher limiting speed. Ships, however, are built to carry cargo. The depth is kept as moderate as possible on account of the shallowness of many harbors, and with a given depth only a certain breadth is practicable or the righting moment will be unduly great. Therefore it is desirable to increase the displacement only by increasing the length; this means that, after allowing a suitable entrance and run, the remainder of the length is applied to extending the parallel middle body.

#### HULL CONSTRUCTION

The plans of the naval architect are prepared on paper and are occasionally supplemented by a wooden model. The three principal ones are the sheer plan (showing sections of the ship made by vertical longitudinal planes), the half-breadth plan (showing sections made by horizontal longitudinal planes), and the body plan (showing sections made by vertical transverse planes). In the figures the dotted lines, 1, 2, 3, are water lines and are the intersections of horizontal longitudinal planes and the inner surface of the planking or plating of the hull; lines *I*, *II*, and *III* are bow (forward) and buttock (aft) lines, made by vertical longitudinal planes; the full lines in the body plan are sections *A*, *B*, *C*, etc., and *A'*, *B'*, *C'*, etc., made by vertical transverse planes, which are passed at equal distances from each other, *X* being at the point of greatest breadth and called the midship section. In the body plan the right half shows half sections forward of the midship section and the left half the half sections abaft it.

The drawings being completed, the work is taken up by the constructive force. The plans are laid off on the mold-loft floor in full size. Wooden molds are then prepared for the frames or else the shapes of the frames are cut (or scribed) into a great piece of flooring called the scribe board. The frames are heated and bent on the bending slab. This is a large floor of thick metal with a great number of holes in which pins

may be placed. The mold of the frame is laid on the bending slab and pins inserted along its edge. The hot-iron angle bar (or channel or Z bar), which is to form the frame (or the outer part of the frame, if it is built up of plates and angles), is then pressed up against these pins

sure against it to insure starting promptly. The ship starts down the ways slowly, but her velocity on reaching the water is frequently considerable and must be checked by hawsers if there is not much room for her to range astern. As soon as she is water-borne she floats clear of

FIG. 7. HALF-BREADTH PLAN.

FIG. 8. BODY PLAN.

and so given its proper curvature. A sufficient number of frames having been prepared, the work of erection begins. The building way is prepared by setting up the keel blocks. These are short heavy timbers 1 foot or more square built up in piles 2 or 3 feet apart and having the upper surface shaped to the keel line of the vessel. On these the keel is laid. In nearly all modern steamers the keel or keel plate is a broad flat plate of extra thickness. It is in sections, riveted together, and joined to the stem and stern posts. After the keel is laid the midship frames are erected and held in place by shores and ribbands until secured by the internal vertical keel, the longitudinals, stringers, side and bottom plating, etc. The large castings or forgings forming the stem and stern posts are then erected, the remainder of the plating put on, and the interior of the ship partly completed.

The next step is the launching, and this may take place at any time after the outside plating is on, and the interior completed so far as necessary to assure sufficient strength and stiffness. The weight of the vessel has so far been supported on the keel blocks and bilge shores. It must now be transferred to the launching ways. These consist of heavy timber ways inclined at about the same angle as the keel blocks (about five-eighths of an inch to the foot) and are built up on each side of them. Resting on the launching ways are the sliding bilge ways, also of heavy timber, and on top of the bilge ways is built a framework that fits closely to the bottom of the ship. This is called the cradle. To remove the weight of the ship to the launching ways wedges are driven under the cradle, lifting the ship off the keel blocks; or the weight during building is taken on sand boxes, from which the sand is allowed to run when ready for launching. The hull is thus lowered instead of being raised. The under surface of the launching ways having been well lubricated, the ship is ready to slide into the water as soon as released by sawing the tie piece, or knocking out the dogshore, which holds her. In the case of large modern ships, instead of tie pieces or dogshores, hydraulic jacks, hold the cradle. When these are released, other jacks at the upper end of the cradle exert a heavy pres-

sure against it to insure starting promptly. The ship starts down the ways slowly, but large ones are commonly launched when not much over half their weights are on board. As soon as the ship is in

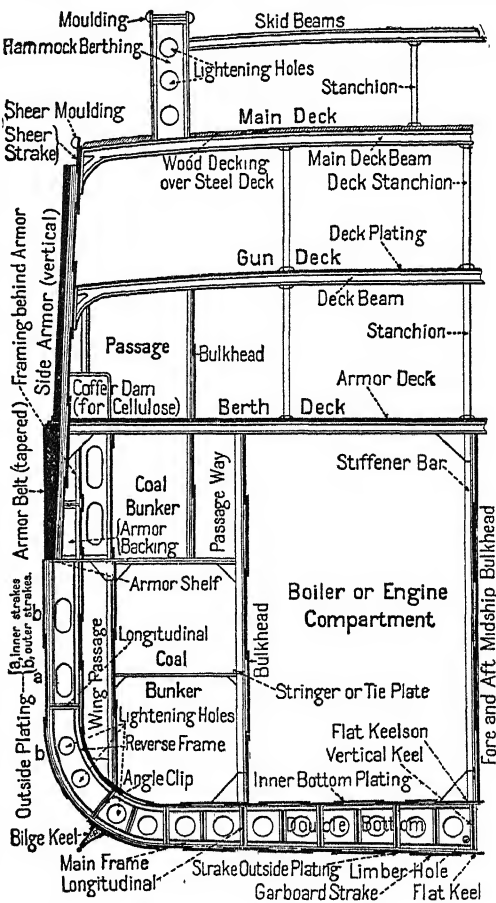

FIG. 9. MIDSHIP SECTION OF BATTLESHIP.

the water the boilers and engines are installed and the interior and upper works finished. In England many armored vessels are built in dry-docks. This saves the labor of lifting heavy weights, it being only necessary to lower them; and the cost of the launching and building ways

is avoided. As an offset to these advantages the use of a drydock is lost for a year or two.

Comparatively few wooden steamers are now built, but wooden sailing vessels are still produced in considerable numbers. The general features of wooden shipbuilding resemble those of shipbuilding in iron and steel, but there are of course differences. The keel blocks are laid in the same way. On them are laid the heavy timbers forming the keel, which are sometimes nearly 2 feet square. The different lengths of timbers are scarfed and bolted together; over and across the keel are laid the floor timbers of the ribs or frames, and the frames are thence built up, being held in place by shores, braces, cross-spalls, beams, and ribbands. Between the floor timbers and extending up usually to the principal deck (sometimes to the rail) the space is closely packed with filling timbers forming a structure which is nearly tight without planking. The beams in wooden ships are of wood, and they may be attached to the frames by wooden or iron knees. The former are considered to give the best fastening, but the iron knees save much room.

The advantage of having a copper bottom has caused a few composite vessels to be built. These are mostly yachts, gunboats, and small sailing vessels. Composite vessels are framed much like

FIG. 10. CELLULAR DOUBLE BOTTOM OF A MERCHANT STEAMER.

those of iron or steel. Over the frames wood planking is used instead of metal plating, though a good many plates of metal are placed under the wood to give the proper strength to the structure in different parts. The wood planking is attached to the frames with bolts setting up with nuts on the inside and is covered with copper to a short distance above water. The topsides of many composite vessels are plated with steel or iron above the level where coppering is necessary, as the metal is stronger and more durable than the wood.

The safety of a ship depends upon its stability, strength, water-tightness, and reserve stability and floatability, if injured. The stability of ships has already been considered. The strength is due to the framing and plating or planking. Water-tightness is effected by calking the seams between plates or planks. The seams of iron plates are calked by forcing the edge of the

uppermost plate against the plate underneath it by means of a calking tool. The seams between planks are partly filled with oakum, which is forced in, and the remainder of the seam filled with pitch, marine glue, or putty. The reserve stability and floatability when injured depend upon the position and volume of the interior space which is flooded. To reduce this volume to a safe point, vessels are divided into compartments by water-tight bulkheads which extend across the ship at intervals. In merchant vessels, except in the engine and boiler spaces, the bulkheads usually have no passages through them, but in men-of-war many of the bulkheads have openings closed by water-tight doors. In addition to transverse water-tight bulkheads many ships have longitudinal ones, such, e.g., as the one separating the engine rooms in a twin-screw vessel. As a further protection against flooding due to striking ground, large vessels usually have a double bottom extending the whole or part of the length and rising at the sides to about the turn of the bilge or higher. The inner bottom thus fitted is laid over the inside of the frames and secured in the same manner as the outside plating. The frames in the double bottoms are deep enough to give considerable space between the inner and outer plating, which is necessary to give access for cleaning and painting. Most frames are lightened by holes cut through them, but about every fourth or fifth frame is water-tight and has no holes. The space between the imperforate frames forms a double-bottom compartment, access to which is had by a manhole closed by a removable water-tight cover. Most ships are fitted with a water-tight bulkhead close to the bow, called the collision bulkhead; many have a similar one aft. The spaces beyond these bulkheads are commonly used as trimming tanks.

For vessels building in the United States and elsewhere, see tables near the end of the article on SHIP AND SHIPPING. See BILGE; BULKHEAD; DECK; LAUNCH; LOAD-LINE MARKS OF VESSELS; MEASUREMENT OF SHIPS FOR TONNAGE; MERCHANT MARINE NAVIGATION; NAVIES; SHIP AND SHIPPING; ETC.

#### MARINE MACHINERY

**General Considerations.** The efficiency of marine machinery, like that of other types, is represented by the equation

$$\text{Efficiency} = \frac{\text{Useful work performed}}{\text{Total energy received}}, \text{ or } E = \frac{W}{e}.$$

The heating value of good semibituminous coal is from 15,000 to 16,000 B. T. U. per pound; fuel oils range between 18,000 and 21,000 units. Of the total heat units in any fuel, only a small portion is turned into useful work. The boiler losses are 30 to 40 per cent, due to incomplete

combustion, radiation, condensation, and waste heat in the smoke-pipe gases. The engine wastes are due to condensation and radiation in the steam pipes, cylinders, or steam spaces, incomplete expansion, friction, and the heat carried into the condenser. These losses exceed 70 per cent. There is a further loss in transmission of the power to the propeller, and in the propeller itself, amounting to 50 or 60 per cent. The total maximum efficiency of the combination, therefore, is about

$$E = \frac{70 \times 30 \times 50}{100 \times 100 \times 100} = 10.5 \text{ per cent,}$$

and the ordinary average efficiency is 5 to 6 per cent. Since this is only about half the maximum, every effort is made to increase it.

The efficiency of steam is represented by

$$E = \frac{T_1 - T_2}{T} = \frac{t_1 - t_2}{t_1 + 461},$$

where  $T_1$  = initial absolute temperature,  $t_1$  = initial temperature F.,  $T_2$  = final absolute temperature, and  $t_2$  = final temperature F. It is evident that the greater the value of  $t_1$  and the smaller the value of  $t_2$ , the higher will be the efficiency of the steam. The amount of heat required to convert one pound of water from a temperature of 100° into steam at 60 pounds' pressure is about 1115 thermal units, and to convert the same water into steam at 200 pounds' pressure is 1140 units, i.e., only 2.5 per cent greater heat is required for three times the pressure. From the foregoing it is evident why high-working steam pressures and a good condenser conduce to engine economy.

A further gain is obtained by expansion. If steam at 50 pounds' pressure be admitted to an engine during the entire stroke of the piston, the work performed by it would be represented by the rectangle *IJKL* in the accompanying dia-

gram. If the same weight of steam be raised to 100 pounds' pressure, cut off at half stroke, and allowed to expand, it would, if it were a perfect gas, have a pressure of 50 pounds at the end of the stroke, and the work performed would be equal to the area *GHJK*; similarly, for 250 pounds, the area would be *ABJK*. There are practicable limits to the point of cut-off and degree of expansion due chiefly to liquefaction because steam is not a perfect gas. The loss from liquefaction can be reduced by (a) using several cylinders in which to effect the total expansion; (b) supplying heat by means of a steam jacket about the cylinder; (c) superheating the steam after generation in the boiler and before admitting it to the engine;

(d) reheating the steam in the receivers between the cylinders; (e) compression; (f) increasing the speed of rotation of the shaft.

The gains and losses in a reciprocating engine have alone been considered, for these will be used as a standard for referring the efficiency of other forms of propelling machinery.

#### PROPELLING ENGINES

After a century of steady improvement the reciprocating engine is giving away to other forms for many classes of vessels. These other forms are direct-connected turbines, geared turbines, turboelectric engines, and reduction gear of the Föttinger and other types.

Reciprocating Engines of recent design are mostly triple expansion. The gain in economy by the compound over the simple is about 50 per cent, of the triple expansion over the compound about 25 per cent, and of the quadruple expansion over the triple about 10 per cent; but the gain is attained at the expense of considerable increase in weight, so that for most conditions the gain in using the quadruple is questionable. A great advantage of the multiple-expansion engine, and one cause for its adoption, is the more even turning effect and the better balancing obtained. The strains upon the machinery, bed-plate, and vessel are thereby reduced, as well as the vibration of machinery and hull. Triple-expansion engines are usually built with cylinders of such size that the crank effort is equalized as far as practicable, and the cranks are set at 120°. When the low-pressure cylinder would be too large to be conveniently installed, or if a better balancing effect is desired, two low-pressure cylinders are used. In the Yarrow-Schlick-Tweedy system of balancing reciprocating engines the arrangement of cylinders along the shaft is: first low pressure, high pressure, intermediate pressure, second low pressure.

The course of the steam is as follows: leaves main steam pipe, passes through separator, then throttle, and into high-pressure valve chest. The movement of the valve opens the steam ports of the cylinder during a part of the stroke and then cuts off; the steam in the cylinder then expands, moving the piston. Just before the end of the stroke the valve opens to the exhaust and at about the same time begins to allow steam to enter on the other side of the piston; this results in cushioning at the end of the stroke. The steam from the exhaust port, reduced in temperature and in pressure, then passes to the intermediate-pressure receiver, which is really the intermediate-pressure valve chest. Thence via the intermediate-pressure valve it enters the cylinders, performs its work, and is again thereby reduced in temperature and pressure (usually at this stage about that of the atmosphere). It then passes through the low-pressure receiver and cylinder or cylinders. On leaving the low-pressure cylinder it goes to the condenser, where it is condensed, and then as water and vapor it is pumped by the air pump to the hot well or feed tank. From there the feed pumps deliver it to the boiler, where it is reëvaporated.

Steam is expanded in triple-expansion engines from six to nine times. The ratio of expansion in each cylinder is such that the volume of steam from the high pressure will just fill the intermediate pressure up to the point of cut-off, and similarly for the intermediate pressure. Piston speed varies from 80 to 100 feet per minute in

long-stroke engines to 500 or 600 in torpedo boats and fast yachts.

**Turbines.** As all mechanical power is delivered through shafting which is caused to revolve by the engine, James Watt and innumerable inventors since his day have endeavored to produce a practicable rotary engine. So far as ship propulsion is concerned, the first successful attempt was that made by the English engineer, the Hon. C. A. Parsons, who about 1896 built the *Turbinia*, a small, high-speed, turbine-propelled boat. Since that date steam turbines (q.v.) have developed rapidly. In 1903 the Cunard line fitted turbine engines of 21,000 horse power in one of their large steamers, and in 1906 the *Lusitania*, with turbine engines of 70,000 horse power, was completed. Many torpedo boats were fitted with them, but the first battleship to have turbine machinery was the *Dreadnought*, launched in 1906. Practically all naval vessels are now driven by turbines or by a combination of turbines and other machinery.

Marine turbines are of two types, impulse and reaction, the former represented by the Curtis and the latter by the Parsons. Both have developed and improved until they are at least as efficient as reciprocating engines, if arranged and operated in a manner to secure the greatest economy, and under certain conditions they are much more so.

In a multiple-impulse turbine in which there are a number of moving rings, as in the Curtis, the velocity of the steam acquired in the nozzles is reduced as the steam passes through the three moving and two fixed blades of each stage. After passing the third moving ring of any stage except the last the steam enters another set of nozzles, in which it loses pressure and gains velocity, and then enters the first ring of another stage, composed of three moving and two fixed rings, and it repeats the cycle. In a four-stage Curtis turbine the peripheral speed of the moving blades is about 400 feet per second. The steam leaves each set of expansion nozzles with a velocity of about 2000 foot seconds, and each moving ring reduces this about 400 feet. After the pressure is reduced to the proper point the steam passes from the final stage to the condenser.

In the impulse turbine the steam loses velocity, but not pressure, while acting on the moving blades. In the reaction turbine the steam loses pressure and acquires relative velocity as it passes each ring of moving blades and of fixed blades. A pair of blades, one moving, one fixed, constitutes a stage. In a low-speed turbine there may be 200 or 300 of such stages, the number depending upon the circumferential speed. In high-speed engines the number of stages may be as low as 45. Owing to the comparatively low velocity of the steam in a reaction turbine, there is practically no wear of the blades from this cause. They are therefore made very thin, while the erosive action of the steam in an impulse turbine is considerable.

As turbines cannot be made to reverse, in applying them to marine propulsion special backing turbines have to be fitted; this adds materially to the weight of the machinery and to the floor space occupied. Furthermore, in order to insure operating economy, the peripheral speed of the turbine must be high or else the propeller will be driven too fast to secure propeller efficiency. To keep the propeller speed within bounds the turbines are made of large diameter when directly connected to the propeller shaft, and this adds

much to the weight. Moreover, the turbine has but one economical speed, and that is high. To secure the requisite reduction in power necessary to give moderate and low speeds, cruising turbines are fitted on war vessels and others in which a moderate speed is necessary during long periods. Further variations in speed are effected by varying the course of the steam through the different turbines of the installation, which, when the turbines are directly connected, consists usually of two to four shafts with one or more turbines on each.

The defects of directly connected turbines have caused numerous efforts to be made to utilize their manifest advantages by indirect connection. The systems in use or proposed are:

(a) Geared turbines in which the rotor is allowed to turn at its economical speed and is connected to the propeller shaft by reduction gearing.

(b) Hydraulic transformer gearing in which the rotor also turns at its economical speed. Centrifugal pump wheels are keyed to the rotor shaft, and impulse-reaction water-turbine wheels are similarly secured on the propeller shaft. The water flows from the pump through the water turbines and so drives the shaft ahead if sent through one set and astern if sent through the other.

(c) Electric transmission in which the turbines, operating at economic speed, drive dynamos which furnish current to motors on the propeller shaft.

Another form of partial indirect connection which is advocated, but up to 1916 had not been applied, consists in the combination of a high-pressure reciprocating engine discharging into a low-pressure turbine, the rotor of which is geared to the shaft it drives.

Each of these methods of indirect connection has its advantages and disadvantages.

The principal advantages of the geared turbine are: reduction in weight (15 per cent) over a directly connected turbine; saving in coal (15 per cent); simplicity of mechanism; reduction in size of turbine casings and easier repair; possible speed-reduction ratio about 30 to 1. Its disadvantages are: some noise, though slight; wear, slight; possible limitation of power (this is disputed); nonreversibility—requires special backing turbine, usually of not more than 50 per cent of ahead power.

The advantages of the hydraulic transformer mechanism are: reversibility without backing turbines and 85 per cent backing power; practically no limitation as to power; no additional noise; no appreciable wear; increased economy and saving of weight as compared with direct turbine drive. The disadvantages are lower efficiency (about 89 per cent) compared with gearing; limitation in speed-reduction ratio, the maximum being about 6 to 1; complication in mechanism.

The advantages of the electric transmission system, in which large high-speed turbines drive the generators, are: saving of weight and space and great steam economy; speed-reduction ratios may be varied at will by changing the motor winding; efficiency at low powers; reversibility without backing turbines and nearly full backing power; transmission adapted to any power; steady running, turbine being uninfluenced by racing of the screws. The principal objections are: difficulty of ventilating generators (this is denied); difficulty of cooling of resistances (not

admitted by advocates of system); complexity of accessories; possible effect of high-tension voltage in steel ships on the ship's instruments and personnel (in the existing installations no trouble on this head has been experienced). One type of electric transmission machinery has Diesel engines for driving the electric generators.

The combination of the geared turbine and the reciprocating engine is designed to utilize the advantages of both and eliminate some of the disadvantages of each. The reciprocating engine is wasteful at the lower end of its cycle of expansion because the energy remaining in the steam at the end of the stroke of the low-pressure piston is not only lost, but it has to be overcome in the air pump and condenser. A low-pressure turbine replaces the low-pressure cylinder and utilizes nearly all the remaining energy of the steam. Such a combination is probably very economical, but its exact efficiency has not been practically determined.

**Internal-Combustion Engines.** Three types of internal-combustion engines (q.v.) are used in the propulsion of vessels, viz., heavy-oil engines of the Diesel type, gasoline, and producer gas engines. The last named has been fitted in experimental installations only; gasoline is too expensive except for small boats, submarines, and yachts; but heavy-oil engines are used in increasing numbers.

Engines of the Diesel type have been built for service on shore that develop over 6000 brake horse power, but the largest installed on board ship up to 1916 were of about 2000 B. H. P. Such engines are usually fitted for twin-screw propulsion, so that one or two ships have machinery of about 4000 B. H. P. (or 5000 I. H. P.). Engines of this power have eight cylinders, as 300 B. H. P. is about the maximum for a single cylinder, and few develop over 200 B. H. P. Diesel engines cost more than steam machinery (including boilers) of the same power, but they weigh considerably less, take up less space, require no boiler personnel, and develop their power at a less cost when the oil does not cost more than three or four times as much (by weight) as coal. There are many advantages connected with the use of oil as fuel. It is easily taken aboard, and the cost of doing so is small. It can be stowed in places unsuitable for coal or cargo, the distance from the engine room, hatches, or deck being comparatively unimportant. This enables the vessel to utilize spaces otherwise wasted and to carry a much larger supply of fuel than a steamer, so that she needs to stop for fuel much less frequently and can make her purchases where oil is cheapest. The saving of space and weight and the decreased personnel add to the cargo capacity, while the remaining advantages reduce the costs in other directions. The total effect of the economies obtained enables these engines to operate at a less expense than a steamer, unless the oil costs five or six times as much as coal—which shows that engine efficiency is not the only point to be considered.

By far the greater number of Diesel engine ships have machinery of the four-stroke cycle type, though two-stroke cycle are used, and the use is apparently increasing. So far the four-stroke engines have proved to be so much more economical in fuel consumption than the two-stroke that the difficulties connected with reversing, the additional complexity of the machinery, the greater weight, and increased cost have not

sufficed to displace them. In recent designs the fuel consumption on long voyages has averaged less than 0.4 pound per B. H. P., including auxiliaries. The maximum shaft speed has been brought down to about 100 r. p. m., so that the propeller efficiency is about as high as that with any form of propulsion machinery.

The difficulty in building marine Diesel engines of great power has so far prevented their use in large high-speed vessels, but for cargo ships, in certain trades, they are said to be very satisfactory, and they are also displacing gasoline engines in submarine boats. Another use, which bids fair to be extended, is for auxiliary propulsion in sailing ships. In some of these it is hard to say whether sails or the engines are auxiliary, as the vessels are full-rigged sailing ships, and the engines are capable of giving a speed of 10 knots, while the fuel supply is sufficient for a power mileage equal to that of the ordinary freight steamer. See INTERNAL-COMBUSTION ENGINE.

#### AUXILIARY MACHINERY

The auxiliary machinery of power-propelled vessels consumes much power and adds considerably to the costs of operation and to the permanent weights carried. The most important auxiliaries of the engine room are the condenser, circulating pump, and air pump. The condenser consists of a cylindrical shell in which there is a transverse diaphragm near each end. Between these diaphragms run the small condenser tubes of copper alloy coated with tin. The steam enters the side of the condenser, circulates about the tubes, is cooled, and goes to the air pump chiefly as water. The air pump assists to lower the vacuum in the condenser as well as to remove the water and vapor, and it discharges into the hot well or feed tank. The circulating water is forced through the tubes by the circulating pump, which takes its cooling water from the sea through the main injection valve and discharges the warm water through the outboard delivery. The action of the condenser and air pump reduces the pressure on the exhaust side of the engine very nearly to a perfect vacuum, 13 pounds below the atmospheric line being common, and under favorable conditions slightly better results are obtained. It is evident that much rests upon an ample supply of the circulating water and upon its temperature.

The principal boiler auxiliaries are feed pumps, hydrokineters, feed-water heaters, superheaters, evaporators, distillers, and ash ejectors or ash hoists. There are usually two or more feed pumps to each group of boilers. They take the water from the feed tank and force it into the boiler. Hydrokineters are used to insure circulation in the boilers. Feed-water heaters are of various types. Most of them use waste steam from auxiliaries to heat the cold feed water before it is supplied to the boiler. There is always a certain loss of water in operating machinery, and this entails an addition of cold water from the ship's fresh-water tanks which makes good the deficiency and is called make-up feed.

The superheater is a tubular addition to the boiler which contains no water, but through which the steam passes on its way from the boiler to the engine. It is heated by the furnace gases after they have passed through the boiler proper, and they raise the temperature of the steam which passes through it 25° F. to 100° F.

This dries the steam and reduces condensation in the engine. Superheaters were not regularly used with reciprocating engines because the dry steam made internal oil lubrication of cylinders necessary, and the oil caused troubles in the boiler. In turbine engines the oil difficulty is not present, and dry steam is much more necessary, so that superheaters are now generally fitted.

The evaporator is similar to a condenser in design, but the tubes are much larger and fewer, and its purpose is quite the reverse. Steam instead of water passes through the tubes; sea water passes around them and is evaporated, leaving its salts behind as an incrustation on the tubes. The steam so formed is then condensed in the distiller and pumped into the ship's fresh-water tanks to cool. The evaporator is a necessary adjunct of the ship's boilers to supply make-up feed, but it also furnishes fresh water for drinking, cooking, washing, etc. The ashes from the boiler are either hoisted to the deck and discharged by hand or gravity or are ejected through a tube discharging above water by means of a steam jet. The apparatus for the latter method of handling ashes is called an ash ejector. Types of ejectors for discharging below water have been used, but are not regarded with great favor.

The electric generating plants of warships and passenger vessels is a very important part of the auxiliary machinery. In turboelectric drive the propelling part of the electric installation forms part of the main engines. In vessels having other types of propulsion electric power is used only for lighting, operating small machinery, handling water-tight doors, operating deck hoists for cargo, turning turrets, handling guns, driving steering and anchor gear, etc. In such ships the generators are of the continuous current type. See DYNAMO-ELECTRIC MACHINERY.

The anchor engine of most vessels is operated by steam or hydraulic power, but in a few ships electric motors are geared to the shafts which drive the cable winches. As the anchor is no longer handled, but simply pulled up into a large hawse pipe and held there, a powerful winch of some sort is all that is needed. The character of the power is immaterial. See ANCHOR; CAPSTAN; CHAIN.

Steering engines are usually steam driven, but many hydraulic and a few electric engines have been installed. The control of hydraulic and steam-steering engines is effected by means of a wheel and small wire ropes, by a telemotor, or by electric gear. Small and medium-size ships have the rudder turned by chains or gears leading from the engine to an arc on the rudder head. In very large ships the rudder is operated by heavy levers driven by hydraulic pressure or a worm wheel.

One of the few machines on all large vessels still operated by steam is the ice machine. In merchant ships it is usually of the ammonia type, but in men-of-war it uses compressed air for refrigerating and ice making. Turret machinery, ammunition hoists, and other ordnance fittings are electrically operated in nearly all modern ships, though hydraulic power is much used in the British navy.

#### BOILERS

Modern marine boilers are of two general types, Scotch and water tube. The Scotch boiler is horizontal, cylindrical, fire tubular; it is used very generally in the merchant service and, until quite recently, in naval vessels. It consists of a cylindrical shell in the lower half of which are placed one or more cylindrical, corrugated furnaces (large boilers have three or four), extending from the front for about three-fourths the length and there opening into the combustion chamber or back connection, a space for furnace gases which rises slightly above the furnace crowns. From the back connection return tubes, extending to the front connection, are placed between and above the furnaces. The furnace gases escape thence to the smoke pipe. Double-ended boilers are occasionally built; they consist of two single-ended boilers, back to back, in a single shell. Scotch boilers are built in all sizes up to 20 feet in diameter and 18 feet in length for single-ended and 24 feet in length for double-ended. They carry steam pressures of 150 to 200 pounds per square inch. Their principal advantages are: reliability; simplicity; they will stand hard usage; they have been in use so long that their peculiarities are very thoroughly understood and generally known. Their disadvantages are: great weight; steam cannot be raised or reduced quickly; heavy forced draft cannot be used; very high pressure cannot be used in boilers of large capacity owing to the thickness of shell which makes the weight excessive; they are difficult to repair; when they begin to deteriorate the working pressure must be lowered, and this reduces the power; owing to the large amount of water contained, accidents are usually serious—often disastrous—to life and property.

The advantages of the water-tube boiler are: lightness; adaptability to high pressure; it is readily adjusted to change of output; forced draft can be used (in nearly all types); it is relatively safe, and accidents are less serious; repairs and renewals are so easily made that all parts are kept up to strength, and reduction of pressure and power are unnecessary. The disadvantages are: increased complication; it needs more care and attention than the cylindrical; it cannot use salty or dirty water; the different types are not so well understood by the average fireman, so that the best results are not always obtained. Of the many kinds in use the Babcock and Wilcox, Yarrow, Niclausse, Schultze, Durr, Belleville, Normand-Sigaudy, Thornycroft, White, Reid, Seabury, and Almy are most common. The economy of fuel is probably about the same in water-tube and cylindrical boilers when each is efficiently operated. For average running, especially in cargo carriers of moderate speed, the cylindrical boiler is considered to be more economical than the water tube; in large high-speed vessels, naval and mercantile, the reverse is the case.

An illustration of a large single-ended cylindrical boiler is shown; *aa* is the shell plating; *bb*, corrugated furnace; *cc*, stays supporting combustion chamber; *DD*, tube sheets with tubes extending between them; some of these are stay tubes and are screwed into the tube sheets, which

they help to support; the other tubes have their ends expanded into the tube sheets; *F*, combustion chamber (back connection), where the gases of combustion are finally mixed and burned; *H, H, H*, steam space stays supporting the boiler ends; *II*, short stay bolts supporting back and sides of combustion chamber; *JJ*, girder stays supporting top of combustion chamber; *KK*, manholes for cleaning. The heating surface is composed of the furnaces, combustion chamber, and tubes, the tube surface being the principal part. The water surface is kept a short distance above the tops of the return tubes *ee*; above this is the steam space, which is fitted with a dry pipe that collects the steam, assists to prevent water from being carried over to the engines, and discharges through the boiler stop valve to the main steam pipe. The furnaces are divided by the grates into very nearly equal parts, the lower being called the ash pit. The

tem of tubes either straight or bent. The feed water usually enters the upper or steam drum and is conducted by down tubes to a lower or water drum; from this the water, becoming heated, rises and passes up through steam-forming tubes to the drum again. Thus a circulation is set up, and the efficiency of the boiler largely depends upon the adequacy of this circulation. As the distance from grate to smoke pipe is usually quite short, it is necessary, in order to extract a proper amount of heat from the gases, to introduce baffle plates for holding the gases in contact with the tubes for a sufficient length of time. Since the gases are external to the water and steam containers, a casing is fitted of sheet metal lined with fire brick, asbestos, or other nonconducting material. Water-tube boilers have all the attachments noted as belonging to cylindrical boilers and some in addition. Nearly all except the Babcock and Wilcox have automatic

SINGLE-ENDED CYLINDRICAL BOILER.

fire-box part (commonly referred to as the furnace) and the ash pit have separate doors. All parts of the boiler (except doors, grates, bridge wall, etc.) are usually built of mild carbon steel; in some cases nickel or special steel is used. The grate surface of such a boiler, with ordinary draft apparatus, develops 13 to 16 horse power per square foot; ratio of heating to grate surface, 30-35 to 1. The weight per I. H. P., including water, is 90 to 120 pounds. The amount of coal burned per square foot of grate is 15 to 20 pounds with ordinary draft arrangements. The efficiency of the boiler is 70 to 75 per cent when in best condition. The attachments of such a boiler are: main and auxiliary stop valves in the steam pipe; check valves, through which the feed water enters; surface and bottom blow valves, through which the water is blown down or pumped out; two water columns (glass tubes) to show the height of the water; pressure gauge; safety valve; circulating apparatus (generally a hydrokineter); superheater.

In water-tube boilers the water is contained chiefly within the tubes, and the furnace gases pass around them, the exact reverse of fire-tube boilers. As the amount of water carried is relatively small, they are usually much lighter than the cylindrical. Most types have a number of steam and water chambers connected by a sys-

tem. Practically all have feed-water heaters. The fitting of superheaters is becoming general. Most types have an arrangement of steam or air for the removal of soot from the tubes.

Drowned-tube boilers are those in which the steam-generating tubes discharge into a steam drum below the level of the water; in priming boilers the discharge takes place at or above the water surface. Such a boiler as the Schultz seems to be neither one nor the other. Large-tube boilers are fitted with tubes of 3 to 5 inches in diameter. Small-tube types have tubes of 1 to 2 inches. Some boilers have large and small tubes. Express is a term applied to rapid-steaming small-tube boilers capable of large power on small weight and of using heavy forced draft. Express boilers are not very economical and are chiefly used on small vessels where speed is more important than economy.

Two forms of water-tube boilers are shown—the Thornycroft and the Niclausse; the Babcock and Wilcox is given on the plate in connection with the article BOILER. The type of Thornycroft boiler as constructed in 1916 closely resembled the Yarrow. The Niclausse boiler shown is of the same design as the ones installed on the French battleship *Bearne*. One tube is in partial section, and a portion of the header casing is removed to show the exterior

of the header end of the next tube above. Where the outer tube is partly cut away, the upper end of the inner one, which is somewhat shorter, is

CROSS-SECTIONAL ELEVATION OF NICLAUSSE HIGH-DUTY BOILER, 1914 TYPE.

visible. The cooler water descends from the steam drum, enters the inner tube, escapes to the outer one, is heated, and reascends to the drum.

THORNYCROFT WATER-TUBE BOILER FOR OIL FUEL, 1913 TYPE.

There are no double tubes in the other boilers which are illustrated.

**Oil Fuel.** The extended use of oil fuel has had an important effect on the design of boilers

and of vessels. While oil costs two to five times as much as coal and is less than 50 per cent more efficient, the gain in other directions offsets the extra fuel expense. There is considerable reduction in fireroom space, because less room is needed for stoking oil-fed boilers. Nearly the whole volume of the bunkers is saved, for oil can be stowed where cargo or other stores cannot be conveniently placed, such as double-bottom tanks and small out-of-the-way and irregularly shaped spaces. Distance from the boilers is of no particular importance. The number of firemen is greatly reduced, and coal passers are eliminated, as there is neither coal nor ashes to handle. The cost, delay, and waste of starting and hauling fires are largely obviated. Merchant vessels plying on routes where oil may be obtained cheaply and coal is high find economy in oil fuel. Where the reverse is the case, coal burning is much less expensive. In the United States navy all new vessels are fitted for burning oil alone. In other navies some ships are so fitted. The hesitation in following American practice is due to the fact that, with the exception of Russia, no nation but the United States has an ample home supply which can be relied upon in time of war. Consult: Bertin, *Marine Boilers* (London, 1898); Parsons, *Steam Boilers—Theory and Design* (New York, 1904); Lyon and Hinds, *Marine and Naval Boilers* (Annapolis, 1915). See article on **BOILER** and its bibliography; also **FUEL FOR SHIPS**; **FUEL SHIP**.

**SHIP CANAL.** See **CANAL**; **PANAMA CANAL**; **SAINT MARYS CANAL**; **SUEZ CANAL**; ETC.

**SHIP FEVER.** See **TYPHUS**.

**SHIPIBO**, shê-pê'bô. An important wild tribe of Panoan stock (q.v.) in the forest region of the upper Ucayali, northeastern Peru. Very little is known concerning them. They were first visited by Franciscan missionaries in 1651. In 1736 they almost destroyed the neighboring and cognate Setebo in a bloody battle. In 1764, by the efforts of the missionaries, a reconciliation was effected between the two tribes, and the Shipibo were collected into a mission settlement, but three years later they massacred all the missionaries and reverted to their former wild life. Consult G. E. Church, *Aborigines of South America* (London, 1912).

**SHIP'KA PASS.** A pass in the Balkan Mountains between Philippopolis and Plevna (Map: Balkan Peninsula, E 3). Elevation, 4370 feet. Opened during the Russo-Turkish War of 1877-78 (q.v.).

**SHIPLEY.** A market town in the West Riding of Yorkshire, England, on the Aire, 3 miles northwest of Bradford (Map: England, E 3). There are important manufactures of worsted and woollens and a large quarrying industry. Pop., 1901, 25,570; 1911, 27,706.

**SHIPLEY, ARTHUR EVERETT** (1861- ). An English zoölogist and educator, born at Datchet, Buckinghamshire, and educated at Christ's College, Cambridge. He was demonstrator of comparative anatomy at Cambridge from 1885 to 1894, lecturer on zoölogy from 1894 to 1908, and from 1910 master of Christ's. He received the honorary degree of Sc.D. from Princeton University and became fellow of the Royal, the Linnean, and the Zoölogical societies. Besides articles, he wrote *Zoölogy of the Invertebrata* (1893). He was translator in part of Weismann's *Essays on Heredity* (2 vols., 1889-92), joint editor and part author of the *Cam-*

*bridge Natural History* (1905-09), and coeditor of *Parasitology* and of the *Journal of Economic Biology*. In 1915 he published *The Minor Horrors of War*.

**SHIPMASTER.** The commander of a merchant vessel, in most countries licensed if master of a steam vessel. He has complete control of navigation and over all on board, whether passengers or crew. He may use strong measures in case of mutiny, even kill a seaman to enforce order, and may compel passengers to obey within reason. He is the representative of the owners on a voyage and in foreign ports and may bind the ship by contracts for necessary supplies, repairs, etc. He may even pledge the cargo in extreme cases. Consult Kay, *Shipmasters and Seamen* (2d ed., London, 1895).

**SHIP MONEY.** A tax levied in England at various times. In 1008, when the country was threatened by the Danes, a law was made obliging all proprietors of 300 hides of land to equip a vessel for coast protection. Elizabeth, on the threatened Spanish invasion, required various ports to fit out ships. In 1626 Charles I levied such an impost in time of actual war. The first levy of ship money in time of peace was issued in 1634, a contribution being demanded from the coast shires. The next year a second writ taxed the entire Kingdom. Resistance was aroused, chiefly because it came by arbitrary authority of the King. In 1637 John Hampden refused its payment. He was prosecuted before the 12 judges of the Exchequer and seven of them pronounced in favor of the crown; but the trial aroused the public, and the Long Parliament in 1640 voted ship money illegal and canceled Hampden's sentence. Consult S. R. Gardiner, *History of England* (London, 1893-95), and *Old South Leaflets*, vol. iii, no. 60 (Boston, 1895).

**SHIPPEN, WILLIAM, JR.** (1736-1808). An American surgeon, born in Philadelphia. He received his education at Princeton and Edinburgh (M.D., 1761), was one of the founders of the medical department of the College of Philadelphia, and became its first professor of anatomy and surgery in 1765. From its formation in 1791 till his retirement in 1806 he was professor in the medical school of the University of Pennsylvania. In 1777 he succeeded his friend John Morgan (q.v.) as surgeon-general of the American army. He showed himself capable and more practical than Morgan, but did not escape jealousy and the consequent accusation of improper administration of office. He resigned in 1781, although the military court did not sustain the charges against him.

**SHIPPENSBURG,** *ship'enz-bërg*. A borough in Cumberland Co., Pa., 41 miles southwest of Harrisburg, on the Cumberland Valley, the Western Maryland, and the Philadelphia and Reading railroads (Map: Pennsylvania, F 7). It is the seat of the Cumberland Valley State Normal School. There are furniture factories, engine and pump works, etc. It was settled in 1749. Pop., 1900, 3228; 1910, 3457.

**SHIPPING.** See SHIP AND SHIPPING.

**SHIPPING, LAW OF.** See ADMIRALTY LAW; MARITIME LAW; ROAD, RULES OF THE.

**SHIPPING ARTICLES.** Articles of agreement between the master of a ship and a seaman serving on board her in regard to wages, length of service, character of service, etc. See SEAMEN, LAWS RELATING TO.

**SHIPPING SUBSIDIES.** Pecuniary aid to

shipping by public grant. The terms "bounty" and "subvention" may be employed in the same sense. The first direct bounty in aid of shipping of any kind was granted in 1730 by the 3 Geo. II, c. 20, § 9, which provided for a bounty of 20 shillings per ton on all vessels of 20 tons or over engaging in the white-herring fisheries. The object of these fishing bounties was to encourage the fisheries, which served as a training school for mariners for the British war fleet. The bounty laws were modified from time to time until they were finally repealed in 1867. It was not, however, until 1839 that the English government began the policy of paying subsidies for mail service. In that year Samuel Cunard made a contract with the British Board of Admiralty, by which he agreed to establish a fortnightly mail service between Liverpool and Halifax for a yearly payment of £60,000. The New World terminal was afterward changed to Boston and then to New York. In 1841 the amount of the subsidy was increased to £80,000, and the number of vessels increased from three to seven. The subsidy was again increased in 1848 to £145,000, but was reduced to £80,000 in 1868, after the failure of its chief competitor, the Collins line. Since that time the amount of the annual subsidy has varied greatly in different years. In 1870 the amount of the subsidy for the transatlantic ocean mail service was made to depend upon the weight of the mail matter transported, the contracts being given to the Cunard and the White Star lines.

The subsidies were given with the twofold purpose of establishing quicker and better mail communications with America and of encouraging a rival to the American clipper lines, which were rapidly driving the British ships out of business. When the United States Congress passed the bill giving a subsidy to the Collins line in 1848, the British government raised the subsidy to the Cunard Company by £65,000, without requiring any additional services, showing that the British government was not solely bent on obtaining a quicker mail service. The subsidy undoubtedly gave the Cunard Company a great advantage over its competitors. Whether, as is often alleged, the subsidy really helped to establish steam navigation is more than doubtful. The Great Western Company was in the field before the subsidized Cunard line.

In 1868 the Cunard line received £80,000 as a fixed subsidy, while the Inman line received £22,161, the North German Lloyd £9504, and the Hamburg-American £3343, paid according to the weight of mail carried. The next year the Cunard received £80,000 for its service twice a week and the Inman £35,000 for a weekly service. The contracts were drawn for seven years. In 1870 the Postmaster-General introduced the system of payment by weight throughout, by which the English lines were paid 4s. per pound for letters and 4d. for papers and the North German Lloyd 2s. 4d. for letters and 2d. for papers. In 1887 the rates were reduced to 3s. for letters and 3d. for other mail, the Cunard and White Star lines to carry all mail except specially directed letters. These rates are about one and a half times the international postal rates, so there is still a subsidy of about £75,000 to the Cunard and White Star lines, not counting the admiralty subventions, amounting to £42,000, which are paid for the privilege of hiring or buying certain of the faster steamers in case of war.

The Peninsular Company in 1837 began the carriage of mails to and from Spain and Portugal for an annual payment of £29,600, which was soon after reduced to £20,500. The next year the company took the contract of carrying the mails between England and Alexandria for £34,200 per annum. In 1842 it became the Peninsular and Oriental Company and took over the service from Suez to Calcutta with a yearly subsidy of £115,000, or about 20s. per mile. The service was soon after extended to China, with an addition of £45,000 to the yearly subsidy at the rate of about 12s. per mile. The East India Company continued to carry the mails between Bombay and Suez for a yearly subsidy of £105,200, or 30s. per mile. In 1858 the Peninsular and Oriental took over the service for £24,700 and rendered a much quicker and more regular service. In 1852 the government advertised for bids for a mail service to Australia. The Peninsular and Oriental offered to perform the Australian service, together with all other contracts, for £199,600 per annum, to be reduced by £20,000 on the completion of the railroad across the Isthmus of Suez.

During the Crimean War the British government chartered 11 of the Peninsular and Oriental vessels for transport service. This so crippled the company's fleet that they were compelled to give up the service between Australia and Singapore. After the war the contract for a monthly service between Australia and Suez was let (1857) to the European and Australian Steam Navigation Company for £185,000 per year, but the severity of the terms and the inefficiency of the management made the enterprise an utter failure, involving the loss in one year of the entire capital of £400,000 and a further debt of £270,000. The Peninsular and Oriental, for a yearly compensation of £180,000, then took the service, including a service to Mauritius and Aden. The latter line was soon given up, and the subsidy was reduced to £134,672. In 1866 the service was made semimonthly and the subsidy increased to £170,000, and four years later a new contract on all the Peninsular and Oriental lines was made, with an annual subsidy of £450,000. Since that time the amount has been steadily decreased until in 1898 it was £330,000.

The Royal West India Mail Steam Packet Company is another line which has drawn heavy subsidies from the British government. It was founded in 1841 and was granted a subsidy of £240,000 for traversing a distance of 684,816 miles every year. There was no advertisement for bids and no revision of the extravagant terms of the contract until 1874. There was little freight and less mail to be carried, and in spite of the large subsidy the company lost about £80,000 the first year through inefficient or dishonest management. The second year the government reduced the mileage to 392,973 miles, leaving the subsidy as before and granting new favors. The service was slow, irregular, and unsatisfactory, and in some years the amount paid in subsidies exceeded the postal receipts of the line by £183,938. The most palpable case of the use of mail subsidy to aid in the extension of British commerce was the Pacific Steam Navigation Company, which was given a subsidy in 1840 for carrying the mails between the ports of Central and South America. No British ports were touched by the service, and the amount of British mail carried was almost nothing. The

bounty kept the company solvent for some years, but the trade was insufficient to justify such a service and eventually the company failed. The Galway line presents another case of the tendency of subsidies to carry the creation of facilities for trade further than circumstances really warrant. This company contracted in 1860 to carry English mails from Galway to Portland, Boston, or New York via Newfoundland, agreeing to deliver dispatches in six days. They built four new vessels, but none of them came up to the requirements of strength and speed. One was lost and two others disabled. The company failed and involved all the investors in ruin.

In 1914 the British government paid in postal and admiralty subventions about \$10,000,000; Canada in 1912 paid subventions amounting to about \$2,000,000. A subsidy of \$194,400 per annum is paid by the British government for the service to Jamaica, as the outcome of the recommendations of the West India Royal Commission of 1896-97, to encourage the fruit trade of the West Indies. This is the only example of a subsidy granted by Great Britain expressly to encourage trade.

Opinions differ as to whether the British postal and admiralty subsidies have resulted in direct advantages which justify the outlay made by the government. Mr. Buxton Forman of the British Post Office gave it as his opinion that this is not always the case; Sir Spencer Walpole, former Secretary of the Post Office, thought full value is received. No careful statistical inquiry with regard to this question has ever been made, nor is it possible to make one. The open bidding on mail contracts does not at all secure service at cost, because there is nothing like free competition among steamship companies. Careful observers, however, agree that the British postal and admiralty subsidies do contain an element of genuine subsidy for the encouragement of British shipping. This belief is strengthened by the refusal of the British government to let the mail contract to the White Star line after its purchase by the Mercantile Marine Company in 1902 until full assurance was given that the White Star Company would remain a thoroughly English concern.

The policy of other European countries is quite different from that of Great Britain. Germany paid (1914) an annual subsidy of 13,000,000 marks for its East Asian service. Other services undertaken by the North German Lloyd were given subsidies amounting to 4,790,000 marks. The German East Africa Company receives 1,350,000 marks for its services to Africa. The total mail subsidies to all lines amount to about 8,000,000 marks. In addition the government gives indirect bounties in the shape of exemption from import duties on materials of construction and preferential railway rates on iron, steel, and fuel used in shipbuilding and on many articles exported in German ships. These reductions in railway tariffs amount to from 36 to 66 per cent of the ordinary rates. The Germans generally feel that these direct and indirect bounties have been a good investment and point to the fact that German shipping has developed very rapidly since the beginning of this policy of protection in 1886. The development of shipping is not, however, conclusive proof of the advantages of the subsidies, since numerous other factors have contributed to the growth of the German mercantile marine.

The annual postal subsidies voted by France

amounted in 1914 to 31,500,000 francs (\$6,030,000). In addition the government paid 10,400,000 francs in construction premiums and 26,000,000 in postal subventions. Navigation subsidies were fixed by the Austrian Law of 1907 at a maximum of \$1,136,800 for the five-year period ending in 1916. Construction bounties varying from \$2.84 per ton for sailing vessels to \$8.12 for steam vessels are paid. A subsidy of \$200,000 annually was voted in 1909 for the service between Trieste and Brazil and Argentina.

Italy began a policy of bounties on construction and navigation in 1885. In 1912 the total bounties in aid of shipbuilding and navigation were \$2,000,000. In 1897 Japan adopted the subsidy policy. In 1912 the shipping subsidies of Japan amounted to \$6,845,995, of which \$551,975 was for construction and the remainder for navigation. Holland, Sweden, Denmark, and Norway pay mail subsidies which are no more than fair compensation for services. In addition Norway and Sweden grant loans to steamship lines, thus subsidizing indirectly through assumption of risks.

Except for the bounties granted in 1792 to certain fishing vessels, the history of government encouragement to shipping in the United States begins with the Act of March 3, 1845, which provided for the transmission of the mails in American ships. An Act of March 3, 1847, authorized the Secretary of the Navy to accept the offers made by E. K. Collins & Co. to carry the mails from New York to Liverpool and by Mr. Sloo for a mail service between New York and Chagres. In 1848 two lines were started under subsidies—one from New York to Bremen, the other from New York to Havre. The most important subsidized line was the Collins line, which began operations June 1, 1850. The original subsidy was \$385,000 per annum for 20 voyages, or at the rate of \$19,250 per voyage. At this time the Cunard line was receiving about \$30,000 per voyage. In 1852 the subsidy to the Collins line was increased to \$33,000 per voyage for 26 trips, or \$858,000 per annum. The competition between the Collins line and the Cunard line was severe from the first. Previous to 1850 the Cunard had a virtual monopoly of the fast-freight business. In a few months after the Collins line started freights fell from £7 10s. a ton to £4 a ton. For a time the Collins line had the advantage in the fight. But the loss of the *Arctic* in 1854 and the *Pacific* a little more than a year later seriously crippled the Collins line. The *Pacific* was succeeded by the *Adriatic*, the finest and fastest steamship of that day, but it was impossible to retrieve such disastrous losses. In 1856 Congress reduced the subsidy to \$385,000 per annum for 20 trips. Two years later all contracts for carrying the mails were abrogated, and the Collins line failed. The cost of this experiment was about \$4,500,000. From 1848 to 1858 the United States government expended a total of about \$15,000,000 in subsidies without any manifest benefit to the American merchant marine. The United States government gave no further mail subsidies until 1866, when a line from New York to Rio de Janeiro was subsidized to the amount of \$250,000 per annum. One year later the Pacific Mail Steamship Company was granted a subsidy of \$500,000 a year for a monthly service to Japan and China via Hawaii. In 1872 the company offered to double the service for an additional \$500,000 a year. With some difficulty a bill

authorizing such a contract was passed by Congress in 1873. It was afterward discovered that the company had spent more than \$1,000,000 to influence Congressmen to vote the subsidy. As a result of this disclosure and of the subsequent failure of the company to comply with the conditions imposed a new contract was abrogated by the government. The Pacific Mail Company, during its 10 years of contract service, received \$4,583,000 in subsidies. In that period there was no increase in the trade of the United States with the Orient that could not be traced to other causes than subsidized mail service, and the general merchant marine declined steadily.

Under the Act of 1891 the United States pays for carrying the mails on a mileage basis as follows: for first-class steamers, \$4 per mile; second-class steamers, \$2 per mile; third-class steamers, \$1 per mile; fourth-class steamers, 66⅔ cents per mile. Besides these contract prices the Post Office Department pays American vessels carrying mail \$1.60 a pound for first-class matter and 8 cents a pound for other matter. Foreign vessels carrying United States mails are paid the international postal rates (44 cents and 4½ cents per pound respectively). It will be seen that these payments constitute a very liberal subsidy to the mail steamers. In 1898 Senator Hanna introduced the first general subsidy measure designed to introduce a system of direct navigation bounties, but after passing the Senate it failed in the House. Similar measures were before Congress in the sessions of 1904-05, 1905-06, and 1906-07. In 1904-05 a committee of the Senate made an exhaustive investigation of the subject and published a report in 1905, recommending a subsidy policy. Consult: Meeker, *History of Shipping Subsidies* (New York, 1905); United States Merchant Marine Commission, *Development of the American Merchant Marine* (Washington, 1906); Dunmore, *Ship Subsidies* (Boston, 1907); Bacon, *A Manual of Ship Subsidies* (Chicago, 1911). See MERCHANT MARINE.

**SHIP RAILWAY.** A railway on which ships are transported either in a cradle running on wheels or in the water in a tank carried on a wheeled truck or car. Such railways are designed to connect two navigable bodies of water separated by an isthmus, and thus save a long détour around the intervening land. They are of very ancient origin. A railway capable of transporting vessels 149 feet long, 16 feet wide, and drawing 8½ feet of water is said to have been in operation across the Isthmus of Corinth as early as 427 B.C. The Greeks in 831 A.D., the Venetians in 1483 at Lake Garda, and the Turks at Constantinople used tramways for the conveyance of vessels across intervening land. Coming nearer to modern times, there are various canal inclines and portage railways built in England and in the United States in the early part of the last century. The railway for large vessels was an extension of the canal inclines, and several very ambitious attempts have been made to construct such thoroughfares at various times. None, however, has ever been carried to completion. One of the earliest propositions for a ship railway to carry ocean vessels was the plan submitted to De Lesseps in 1860 for crossing the Isthmus of Suez. In 1872 a similar railway across Honduras was proposed to connect the Atlantic and Pacific oceans, but the project failed for lack of money. In 1879 Capt. James B. Eads proposed a ship railway across

the Isthmus of Tehuantepec. Various plans were proposed by Captain Eads for this structure, the earliest being for ships 350 feet long, of 6000 tons, carried in cradles running on 1380 wheels. The length of the road across the isthmus was about 150 miles, and it was planned to run it at a speed of from 6 to 10 miles an hour. The most important project ever developed for a ship railway was that known as the Chignecto Ship Railway in Nova Scotia. A neck of land only 15 miles wide separates Chignecto Bay, an inlet from the Bay of Fundy, from Baie Verte, leading through Northumberland Strait into the Gulf of St. Lawrence. It was proposed to construct a ship railway across this neck to enable coasting vessels of 1000 tons' register and 2000 tons' displacement to avoid a stormy detour of 500 miles around the coast of Nova Scotia. The line proposed was 17 miles long and nearly straight throughout. The construction of this road was begun in 1838 and was about three-quarters completed in 1891 when work was abandoned for lack of funds. Since the Chignecto railway no ship railway has been seriously considered, though many individual plans for such roads have been proposed.

A marine railway is a device frequently employed at shipyards to haul out small vessels and especially yachts for repairs to the hull or clearing. A cradle is carried on wheels running on rails extending into deep water, and on to this the vessel is floated and supported so that it can be drawn out.

**SHIPS.** See SHIP, ARMORED; SHIP AND SHIP-PING; SHIPBUILDING.

**SHIPS, CLASSIFICATION OF, FOR MARINE INSURANCE.** The process of correlating all information obtainable about a vessel, in order that the underwriters may be guided in granting insurance. This work is done by registration societies such as the Bureau Veritas, Lloyd's Register, etc. For a description of these societies and their work, see SHIP AND SHIPPING.

**SHIPS, FUEL FOR.** See FUEL FOR SHIPS.

**SHIPS, MEASUREMENT OF.** See MEASUREMENT OF SHIPS.

**SHIPS' BOYS.** See BOYS, SHIPS'.

**SHIP'S COMPANY.** The ship's company is the crew of the ship. It is organized in accordance with the requirements of the rig. In large, full-rigged ships the crew was divided into fore-castle-men, foretopmen, maintopmen, mizzen-topmen, and afterguard. Owing to the increase in mechanical means of handling sails these divisions are now almost obsolete—entirely so in the navy and in merchant steamers, and the number of square-rigged merchant ships is very small. In modern men-of-war the organization of the ship's company is based on the battery and engines. The men are stationed at the guns, ammunition rooms, boilers, and engines, according to the various needs. See COMPLEMENT.

**SHIP'S LIGHTS.** See LIGHTS, SHIP'S.

**SHIP'S MAGNETISM.** See COMPASS.

**SHIPS OF WAR.** See FRIGATE; RAM, MARINE; SHIP AND SHIPPING; NAVIES; SHIPBUILDING; SHIP, ARMORED.

**SHIP'S PAPERS.** A merchant vessel is required to carry certain documents which are termed the "ship's papers." These consist of: (1) register, sometimes replaced or accompanied by (a) certificate of enrollment (if employed in United States coasting trade), (b) passport issued by the sovereign authority, (c) sea letter issued by the local authorities of the port of

departure; (2) charter party (q.v.) if chartered; (3) log book (q.v.); (4) bills of lading (q.v.), or duplicate receipts of cargo from the master to shippers; (5) invoices, or detailed statements of separate lots of goods; (6) manifest (q.v.), or general statement of cargo; (7) clearance (q.v.), or permission from the authorities to sail; (8) muster roll, or list of crew; (9) shipping articles (q.v.); (10) bill of health (q.v.); (11) bill of sale (if ship has been sold by citizens of one country to citizens of another) together with consular certificate; (12) certificate of inspection; (13) officers' licenses; (14) passenger list (if passengers are carried); (15) license to carry on a particular trade (fishing, carrying oil, explosives, etc.). The evidence of nationality of United States vessels is contained in: (a) register for foreign trade; (b) certificate of enrollment for coasting vessels; (c) license for enrolled vessels; (d) license for vessels under 20 tons; (e) license for fishing vessels; (f) sea letter or passport issued by a collector of a port to certify to national character and ownership of vessel; (g) consul's certificate for foreign vessel purchased abroad by American citizens. In foreign countries the evidence is found as follows: Austria, in royal license and certificate of registry; Great Britain, certificate of registry; Brazil, Portugal, and Sweden, passport; Denmark, certificate of nationality and registry; Germany and Norway, certificate of nationality; Russia and Spain, patent authorizing the use of flag. The register or certificate of registry should contain the following information: name and character of vessel, name of country to which it belongs, dimensions of vessel, rig, date of building, name of master, name of owner or owners, date of registry, number (international signal code), and signatures and seals of the officials issuing the document.

**SHIP'S POSITION.** See NAVIGATION.

**SHIPTON, MOTHER.** A reputed English prophetess, probably fictitious, of the time of Henry VIII. She is first heard of in 1641, when *The Prophecies of Mother Shipton*, an anonymous tract, was published in London. Chapbooks and pamphlets purporting to be collections of her prophecies appeared frequently. In 1862 one Charles Hindley reprinted what purported to be a life of Mother Shipton, originally published by Richard Heady (London, 1684). He inserted some doggerel verses of his own and wound up with the declaration that the world would come to an end in 1881. Hindley in 1873 acknowledged that the verses were a hoax. Consult W. H. Harrison, *Mother Shipton Investigated* (London, 1881).

**SHIPWORM, or TEREDO.** An aberrant or much modified lamellibranch mollusk of the family Teredinidae, so called from being worm-

A SHIPWORM (*Teredo navalis*).

Timber bored by the mollusk; t, tube; sh, shell; v, valves of shell; f, foot; c, collar; p, pallets; s, siphons.

like in general shape and from boring into hulls below their waterline. The animal is several

inches to 3 feet in length. The shell itself is much reduced, equivalve, widely gaping, and covers only a part of the animal. The mantle of the animal secretes a calcareous lining to the burrow. *Teredo navalis* is said to be cosmopolitan and is the most abundant species on the United States coast. The shipworm, besides honeycombing the logs of wharves and piles and injuring fish pounds and traps as well as lobster pots, has been a serious pest of wooden ships; for this reason ships have copper sheathing. Its mode of boring has not been satisfactorily explained—it is usually with the grain of the wood.

Shipworms are found in a fossil state first in Jurassic rocks, where their shells are found in burrows made by the animals in wood that is now petrified. They are found in similar situa-

tions in the Cretaceous and Tertiary of North America, Europe, and Asia, but show little difference from modern forms. Consult A. A. Gould, *Invertebrates of Massachusetts* (Boston, 1870), and A. E. Verrill, *Invertebrate Animals of Vineyard Sound* (Washington, 1874).

**SHIPWRECK.** The accompanying table shows the more important disasters since the introduction of steam and more general transatlantic travel. Like other tables of this character the statistics in many cases can be considered but approximate. The list is useful in placing the dates of the more serious marine catastrophes outside of purely naval operations, for it must be borne in mind that the table does not give ships destroyed in actual warfare, though it shows certain disasters to warships in times of peace. See SAFETY AT SEA; WRECK.

## CHIEF DISASTERS AT SEA, 1841-1915

YEAR	Month and day	Name of ship	Nationality	Voyage or place	Nature of disaster	Loss of life
1841	March 11	<i>President</i>	U. S.	New York to Liverpool	Never heard from	136
1841	August 9	<i>Steamer Erie</i>	U. S.	Lake Erie	Burned	175
1847	April 28	<i>Esanough</i>	American	Londonderry to Quebec	Foundered	200
1847	November 19	<i>Sigs Tahsman and Tempest</i>	American	On Ohio River	Collision	100
1847	November 21	<i>Steamer Phanix</i>	U. S.	Lake Michigan	Burned	about 240
1847	December 20	<i>Steam frigate Avenger</i>	British	Coast of Africa	Wrecked	284
1848	August 24	<i>Emigrant ship Ocean Monarch</i>	U. S.	North Wales	Burned	396
1850	March 30	<i>Steamer Royal Adelaide</i>	British	Off Margate	Wrecked	200
1850	June 17	<i>Steamer Griffith</i>	U. S.	Lake Erie	Burned	300
1850	November 19	<i>Emigrant ship Edmond</i>	British	Coast of Ireland	Wrecked	96
1852	January 4	<i>Steamer Amazon</i>	British	Bay of Biscay	Burned	140
1852	February 26	<i>Troopship Birkenhead</i>	British	Queenstown to Cape of Good Hope	Wrecked	463
1852	August 20	<i>Steamer Atlantic</i>	U. S.	Lake Erie	Sunk in collision	250
1853	February 16	<i>Steamer Independence</i>	U. S.	Coast of Lower California	Burned	140
1853	September 28	<i>Emigrant ship Annie Jane</i>	British	Coast of Scotland	Wrecked	348
1853	Dec. 23-31	<i>Troopship San Francisco</i>	U. S.	New York to California	Foundered	240
1854	January 2	<i>Emigrant ship Taylor</i>	British	Off Lambay, Ireland	Wrecked	200
1854	March	<i>Steamer City of Glasgow</i>	British	Liverpool to Philadelphia	Never heard from	250
1854	April 16	<i>Steamer Peshatan</i>	U. S.	Off Barnezet	Wrecked	250
1854	May 10	<i>Troopship Lady Nugent</i>	British	Bay of Bengal	Foundered	400
1854	September 27	<i>Steamer Arctic</i>	U. S.	Liverpool to New York	Sunk in collision	350
1854	Nov 13-16	<i>Eleven transports</i>	British	Bound for Crimea	Wrecked in storm	500
1855	May 1	<i>Emigrant ship John</i>	British	Off Falmouth	Wrecked	191
1856	January 28	<i>Steamer Pacific</i>	U. S.	Liverpool to New York	Never heard from	186
1856	January 30	<i>Chilean warship Cazador</i>	Chilean	Off Funchuang	Wrecked	314
1856	November 2	<i>Ion steamer Le Lyonnais</i>	French	New York to Havre	Sunk in collision	160
1857	February 26	<i>Steamer Tempest</i>	.....	.....	Never heard from	150
1857	June 26	<i>Steamer Montreal</i>	Canadian	Quebec to Montreal	Burned	250
1857	August 20	<i>Ship Dumbur</i>	English	Off Sydney, Australia	Wrecked	121
1857	September 12	<i>Steamer Central America</i>	U. S.	Havana to New York	Foundered	400
1858	September 13	<i>Steamer Ausiria</i>	German	Hamburg to New York	Burned	471
1859	April 23	<i>Ship Fougere</i>	U. S.	Off Ireland	Wrecked	386
1859	October 25	<i>Steamer Royal Charter</i>	British	Anglesea coast	Wrecked	220
1860	February 17	<i>Ship Lima</i>	U. S.	Off Bardleur	Wrecked	100
1860	February 19	<i>Steamer Hungarian</i>	British	Cape Sable, N. S.	Wrecked	205
1860	September 8	<i>Steamer Lady Elgin</i>	U. S.	Lake Michigan	Sunk by collision	287
1863	February 7	<i>H. M. S. Orpheus</i>	British	New Zealand	Wrecked	190
1863	April 27	<i>Steamer Anglo-Saxon</i>	British	Cape Race, N. F.	Wrecked	300
1865	August 24	<i>Emigrant ship Eagle Speed</i>	British	British Ocean	Foundered	265
1866	January 11	<i>Steamer London</i>	British	Bay of Biscay	Foundered	220
1866	January 30	<i>Steamer Missouri</i>	U. S.	Ohio River	Exploded	100
1866	January 30	<i>Steamer Miami</i>	U. S.	Mississippi River	Exploded	150
1866	October 3	<i>Steamer Evening Star</i>	U. S.	New York to New Orleans	Foundered	250
1867	October 29	<i>Royal Mail steamers Rhone, Wye, and other ships</i>	British	St. Thomas, West Indies	Wrecked by hurricane	1000
1868	April 9	<i>Steamer Sea Bird</i>	U. S.	Lake Michigan	Burned	100
1869	October 27	<i>Steamer Stonewall</i>	U. S.	Cairo, Ill.	Burned	200
1870	January 24	<i>U. S. S. Oneida</i>	U. S.	Yokohama	Sunk by collision	120
1870	January 28	<i>Steamer City of Boston</i>	British	New York to Liverpool	Never heard from	141
1870	September 7	<i>H. M. S. Captain</i>	British	Off Finisterre	Foundered	472
1870	October 19	<i>Steamer Cambria</i>	British	Inishtrahul, Ireland	Wrecked	173
1871	July 30	<i>Staten Island ferryboat, Westfield's boilers</i>	U. S.	New York harbor	Explosion of boilers	100
1873	January 22	<i>Emigrant ship Northfleet</i>	British	Dungeness	Sunk in collision	300
1873	April 1	<i>Steamer Atlantic</i>	British	Nova Scotia	Wrecked	547
1873	November 22	<i>Steamer Ville du Havre</i>	French	New York to Havre	Sunk in collision	226
1874	November 17	<i>Emigrant ship Cospatrick</i>	British	37° 15' S. lat., 12° 25' E. long.	Burned at sea	470
1875	May 7	<i>Steamer Schiller</i>	German	Selly Islands	Wrecked in fog	300
1875	November 4	<i>Steamer Pacific</i>	U. S.	Cape Flattery	Sunk by collision	236
1877	July 15	<i>Steamer Elen</i>	British	North of Valparaiso	Wrecked	100
1877	November 24	<i>U. S. S. Huen</i>	U. S.	Coast of North Carolina	Wrecked	100
1878	January 31	<i>Steamer Metropolis</i>	U. S.	North Carolina	Wrecked	100
1878	March 24	<i>H. M. training ship Eurydice</i>	British	Isle of Wight	Foundered	300
1878	September 3	<i>Steamer Princess Alice</i>	British	Thames River	Sunk in collision	600
1878	December 18	<i>Steamer Byzantin</i>	French	Dardanelles	Sunk in collision	210
1880	January 31	<i>H. M. training ship Atlanta</i>	British	Bermuda	Never heard from	280
1880	November 24	<i>Steamer Uncle Joseph</i>	French	Spezzia	Sunk by collision	250
1881	May 24	<i>Steamer Victoria</i>	Canadian	Thames River, Canada	Wrecked	200
1881	August 30	<i>Steamer Victoria</i>	British	Cape of Good Hope	Wrecked	331
1883	July 3	<i>Steamer Daphne</i>	British	Clyde	Capstized in launching	546
1884	January 18	<i>Steamer City of Columbus</i>	U. S.	Gay Head Light, Mass.	Wrecked	99
1884	April 3	<i>Steamer Daniel Steinman</i>	Belgian	Sambro Head, N. S.	Wrecked	131
1884	April 18	<i>Bark Pomena and steamer State of Florida</i>	.....	Coast of Ireland	Both sunk in collision	150
1884	July 22	<i>Steamers Glen and Latham</i>	Spanish and British	Finisterre	Both sunk in collision	150
1887	January 20	<i>Steamer Kapunda</i>	British	Coast of Brazil	Sunk in collision	300
1887	November 15	<i>Wah Yeung</i>	British	Canton to Hongkong	Burned	400

## CHIEF DISASTERS AT SEA, 1841-1915—Continued

YEAR	Month and day	Name of ship	Nationality	Voyage or place	Nature of disaster	Loss of life
1887	November 19	Steamer <i>W. A. Sholten</i>	Dutch	English Channel	Sunk in collision	134
1888	August 11	Steamer <i>Gelser</i>	Danish	Off Sable Island	Sunk in collision	105
1889	March 18	U. S. warships <i>Trenton</i> , <i>Vandalia</i> , <i>Nipsic</i> and German ships <i>Adler</i> and <i>Eber</i>	.....	Samoa Islands	Wrecked	200
1890	January 2	Steamer <i>Persia</i>	.....	Island of Corsica	Wrecked	130
1890	February 17	Steamer <i>Rouang</i>	British	China Sea	Wrecked	400
1890	March 1	Steamer <i>Quetta</i>	British	Cape York, Torres Straits	Wrecked	124
1890	September 19	Frigate <i>Etiopoul</i>	Turkish	Coast of Japan	Foundered	540
1890	November 10	H. M. S. <i>Serpent</i>	British	Coast of Spain	Wrecked	167
1891	March 17	Steamer <i>Utopia</i>	British	Gibraltar	Sunk in collision	574
1891	April 22	Chilean warship <i>Blanco Encalada</i>	Chilean	Caldera Bay	Torpedoed	200
1892	January 13	Steamer <i>Nanchow</i>	.....	China Sea	Wrecked in China Sea	414
1892	October 28	Steamer <i>Roumania</i>	British	Portuguese coast	Wrecked	113
1892	February 11	Steamer <i>Naronic</i>	British	Liverpool to New York	Never heard from	
1893	June 22	H. M. S. <i>Victoria</i>	British	Off Tripoli	Sunk by collision	350
1894	November 1	Steamer <i>Wairarapa</i>	British	Coast of New Zealand	Wrecked	103
1895	January 30	Steamer <i>Elbe</i>	German	North Sea	Sunk in collision	380
1895	March 13	Cruiser <i>Reina Regenta</i>	Spanish	Mediterranean	Foundered	100
1895	May 27	Steamer <i>Don Pedro</i>	French	Coast of Spain	Wrecked	400
1895	May 28	Steamer <i>Colma</i>	U. S.	Coast of Mexico	Wrecked	180
1896	June 18	Steamer <i>Drummond Castle</i>	British	Off Ushant, France	Wrecked	244
1898	February 15	U. S. S. <i>Maine</i>	U. S.	Havana harbor	Blown up	282
1898	July 4	Steamer <i>Lz Bourgogne</i>	French	Off Sable Island, N. S.	Collision	560
1898	October 14	Steamer <i>Motegaz</i>	British	Off Lizard	Wrecked	106
1898	November 27	Steamer <i>Portland</i>	U. S.	Cape Cod, Mass	Sunk in storm	157
1901	February 22	Steamer <i>Rio de Janeiro</i>	U. S.	San Francisco harbor	Wrecked	128
1901	April 1	TraSPORT <i>Aslan</i>	British	Red Sea	Wrecked	180
1902	July 21	Steamer <i>Primus</i>	.....	Elbe	Sunk in collision	112
1903	June 7	Steamer <i>Lobau</i>	French	Marseilles	Sunk in collision	150
1904	June 15	Steamer <i>General Stocum</i>	U. S.	East River, N. Y.	Burned	over 1000
1904	June 28	Steamer <i>Norge</i>	.....	Scottish coast	Wrecked	846
1905	September 13	Warship <i>Mikasa</i>	Japanese	.....	Sunk by explosion	599
1906	January 21	Battleship <i>Aquidaban</i>	Brazilian	Rio Janeiro	Sunk by explosion	212
1906	January 22	Steamer <i>Valencia</i>	U. S.	Volcaner Island	Lost	129
1906	August 4	Steamer <i>E. S. S. Siro</i>	Italian	Cape Palos	Wrecked	350
1906	October 21	Steamer <i>Varag</i>	Russian	Viadrivostok	Struck by torpedo, accidentally sunk	140
1907	February 12	Steamer <i>Larchmont</i>	U. S.	Long Island Sound	Sunk in collision	131
1907	February 22	Steamer <i>Berlin</i>	British	Hook of Holland	Stranded	128
1907	March 12	Battleship <i>Iena</i>	French	Toulon	Explosion	117
1907	July 20	Srs. <i>Colunhuiz</i> and <i>San Pedro</i>	U. S.	California coast	Collision	100
1907	November 26	Steamer <i>Kaplan</i>	Turkish	North Sea	Foundered	110
1908	March 23	Steamer <i>Mutsu Maru</i>	Japanese	Hakodate	Sunk by collision	200
1908	April 30	Traillor cruiser <i>Matsu Shima</i>	Japanese	Pescadores Islands	Sunk by explosion	200
1908	July 28	Steamer <i>Yan King</i>	.....	Hongkong	Foundered	200
1908	November 6	Steamer <i>Tuich</i>	.....	.....	Sunk in storm	150
1908	November 25	Steamer <i>Sardulico</i>	British	Off Malacca	Burnt	150
1908	November 27	Steamer <i>San Pablo</i>	.....	Philippines	Sunk	100
1909	July 28	Steamer <i>Waratah</i>	British	Port Natal to Cape Town	Never heard from	800
1909	November 14	Steamer <i>La Seyne</i>	French	Riou Straits	Sunk in collision	101
1910	February 10	Steamer <i>Gza Chanzy</i>	French	Off Minorca	Wrecked	154
1911	September 25	Battleship <i>Liberty</i>	French	Toulon	Sunk by explosion	285
1912	March 21	Steamer <i>Koompana</i>	British	Off Western Australia	Wrecked	130
1912	April 14	Steamer <i>Titanic</i>	White Star	41° 43' N. lat., 50° 14' W. lonz.	Collision with iceberg	1503
1913	October 10	Steamer <i>Volturro</i>	British	Mid-Atlantic	Burned	136
1914	May 29	Steamer <i>Empress of Ireland</i>	British	Quebec to Liverpool	Collision with Norwegian collier <i>Storstad</i>	1023
1915	May 7	Steamer <i>Lustianta</i>	British	Off Ireland	Sunk by German submarine	1150
1915	July 24	Steamboat <i>Eastland</i>	U. S.	Chicago River	Capized at wharf	852
1915	November 9	Steamer <i>Ancona</i>	Italian	Mediterranean	Sunk by Austrian submarine	272

**SHIRAS, GEORGE, JR. (1832-1924).** An American jurist. He was born in Pittsburgh, graduated at Yale in 1853, and was admitted to the Pennsylvania bar in 1856. In 1892 he was appointed associate justice of the United States Supreme Court by President Harrison and confirmed, though his nomination was opposed by the Pennsylvania Senators. He retired in 1903. In 1894 he gave his opinion against the constitutionality of the income tax. See *INCOME TAX*.

**SHIRAZ, shē'ráz.** The capital of the Province of Farsistan, Persia, 112 miles from the Persian Gulf and 35 miles southwest of ancient Persepolis (q.v.) (Map: Persia, E 8). It is built on a limestone ridge of the West Persian mountain system, 4750 feet above the sea, and inclosed by walls nearly 4 miles in circumference. There are fine mosques, a citadel, bazars, colleges, caravanserais, etc. The houses, chiefly of stone, are of better appearance than most other Persian towns. The adjoining plain is well watered and has vineyards and rose gardens. The principal manufactures are silk, cotton, and woolen goods, rose water, glass, and inlaid goods. The wine of Shiraz, very strong and resembling Tokay, is famous throughout

the East. Shiraz carries on trade with Yezd, Ispahan, and Bushire, receiving from the last Indian and European goods. The city was founded in 697 A.D., and from its beautiful situation and fine climate became a favorite resort of the Persian princes and under Kerim Khan in 1760 the capital of Persia. Earthquakes accompanied by great loss of life in 1812, in 1824, and in 1853 laid almost the whole town in ruins. The city has been partially rebuilt in a somewhat inferior style, and its population is now estimated at 55,000. Shiraz has been sung by scholars and poets, including S'adi and Hafiz.

**SHIRE** (AS. *scire*, *soyre*, district, county, jurisdiction, business, from *scirian*, *scerian*, secondary form of *sciran*, *sceoran*, to cut off, shear, OHG. *sceran*, Ger. *scheren*, to cut, shear; connected with Gk. *kelpw*, *keirein*, Lith. *skirti*, to cut). A term which seems to have originated before the time of King Alfred and is usually applied to the districts, often called counties, into which Great Britain is divided; but the word is also used for districts smaller than counties, e.g., Hallowshire in Yorkshire. Some of the counties of England, as Kent, Essex, Surrey, Norfolk, and Suffolk, were formed out

of the petty Anglo-Saxon kingdoms, which gradually became consolidated into one. The substitution of ealdormen (or earls) for kings marks the gradual organization of the shires. It was usually convenient to split up a large kingdom into several shires. The national and military head of the shire was the ealdorman, an office not necessarily hereditary, though it had a tendency to become so. Shire is applied to all the Welsh counties except Anglesea. In Scotland, English tendencies of the sovereigns from Malcolm Canmore and the tide of immigration from the south brought in, among other innovations, the division into shires—probably early in the twelfth century. Twenty-five shires or counties are enumerated in a public ordinance of the date 1305.

In England, south of the Tees, there was a subdivision of shires into hundreds (q.v.), in some localities called wapentakes; these hundreds, or wapentakes, were further subdivided into tithings, and it became incumbent on every one to be enrolled in a tithing and hundred for the purposes of government. In some of the larger counties there was an intermediate division between the shire and the hundred. Yorkshire had and still has its ridings (q.v.), Kent had its lathes, and Sussex its rapes. The division into hundreds and tithings never penetrated into the four northern counties of England or into Scotland, where ward and quarter were the immediate subdivisions of the county. Consult Sir William Stubbs, *Constitutional History of England*, vol. i (6th ed., Oxford, 1897). See ANGLO-SAXONS; COUNTY.

**SHIRE**, shēr'ā. A river of southeast Africa (Map: Congo, Belgian, F 6). It is the outlet of Lake Nyassa, from which it issues in lat. 14° 28' S. and after a southerly course of 250 miles joins the Zambezi 90 miles from its mouth. The navigation is interrupted by a cataract, in which in 35 miles the river falls 1200 feet, about midway between the lake and the Zambezi. Below the rapids it expands into a broad, navigable stream, though somewhat obstructed by the abundance of aquatic vegetation.

**SHIRE**, KNIGHTS OF THE. See KNIGHTS OF THE SHIRE.

**SHIRE HORSE**. An English draft horse. Its exact origin is obscure. Horses of a large draft type existed in England from early times and were improved in the latter part of the eighteenth century by Robert Bakewell, who crossed the type, then known as the Leicester-shire cart horse, with imported Dutch mares. The modern shire horse has been still further improved, retaining the features of large size, hairy legs, and draft type, but having more action and life, better quality and finish, and greater uniformity of type. He is from 16 to 17 hands high, with broad chest, short neck, straight shoulders, and broad, short back. The predominant color is brown or bay, with white about the feet.

**SHIRLAW**, shēr'lā, WALTER (1838-1909). An American decorative, landscape, and genre painter; also an illustrator. He was born at Paisley, Scotland, and was brought to America as an infant. After being employed for 10 years as bank-note engraver in New York and Chicago he took up painting. He was one of the prime movers in the organization of the Chicago Academy of Design. From 1870 to 1877 he studied at Munich under Wagner and Raab, and the influence of this training was always recogniz-

able. While abroad he painted his "Tuning of the Bell" (1874); "Sheep Shearing," exhibited at the National Academy of Design in 1877, now in the St. Louis Museum; and "Good Morning," now in the Buffalo Academy of Fine Arts. Upon his return to the United States he became one of the first instructors in the Art Students' League, New York, and was elected National Academician in 1879. He was one of the founders of the Society of American Artists and its first president (1877). His easel paintings are usually genre subjects, showing fine decorative feeling for line and color and free-flowing brushwork, with a tendency towards rich and warm low tones. Among them are: "Kappelmeister"; "Old Fiddler"; "Marble Quarry" (1880); "Very Old." Others are: "Eager for the Fray"; "Goose Girl"; "Jealousy"; "Kiss"; "Barnyard"; "In Mischief." Notable examples in pastel are: "The Dance"; "The Butterfly"; the beautiful "Morning"; "Easter Greeting." His most important decorative works are the frieze "Peace and Plenty" for the dining room in the house of D. O. Mills, New York City, and eight panels for the Congressional Library, Washington. Shirlaw died in Madrid. In 1911 a memorial exhibition of nearly 200 paintings, drawings, and pastels was held in New York and other American cities.

**SHIRLEY**, shēr'li. A novel by Charlotte Brontë (1849), the scene of which is a Yorkshire mill town. The heroine, Shirley Keeldar, was drawn from Emily Brontë.

**SHIRLEY** (SHERLEY), SIR ANTHONY (1565-c.1635). An English navigator. He was educated at Hart Hall, Oxford. In 1591 he accompanied the Earl of Essex on his expedition to Normandy and was knighted by Henry IV. Queen Elizabeth, angered at his acceptance of this honor without her consent, had him imprisoned until he gave up the Order of St. Michael that had been conferred upon him. In 1596 he led a buccaneering expedition to the West Indies and South America. An account of this cruise was published by Hakluyt in *Voyages and Discoveries* (1598). In 1599 he sailed to Persia, where he was hospitably received by Shah Abbas the Great, who made him Ambassador to the Christian courts of Europe. He passed his last years in Madrid, a pensioner of the King of Spain. He died in poverty some time after 1635. In 1613 he published *Travels into Persia*, a dull book. Sir Anthony had two brothers, SIR ROBERT and SIR THOMAS, who were also adventurers. The three brothers were made the subject of *Travailes of Three English Brothers* (1607), a play written by John Day in collaboration. Consult *The Sherley Brothers* (Roxburghe Club, 1848).

**SHIRLEY**, JAMES (1596-1666). An English dramatist, born in London in September, 1596. He attended the Merchant Taylors' School, London (1608-12), whence he passed to St. John's College, Oxford. He afterward entered Catharine Hall, Cambridge, where he received the degree of B.A. (c.1618). Subsequently he took orders and became a minister at St. Albans. He gave up his living, owing to his conversion to the Church of Rome, and held the mastership of the grammar school from 1623 to 1625. At the end of this period he moved to London and began his career as playwright. Before the theatres were closed in 1642 he produced about 40 plays, most of which have survived. He was befriended by the court, for which he com-

posed many masques. He shared in the misfortunes of the Royalists during the Civil War. Surviving until after the Restoration, he became an important literary figure. He died during the great fire of 1666 and was buried in St. Giles's churchyard. Shirley carried on the traditions of the Elizabethan drama and served as a link to the new drama after the Restoration. Dryden disparaged his work, but his reputation revived under the appreciation of Richard Farmer and the warm praise of Charles Lamb—appreciation and praise rightly due a dramatist whose plays are in such measure high poetry, stamped with rare imaginative power and beauty. Compared with contemporaries in the drama, it is to his credit that he had respect for himself and his audience and seemed, on the whole, averse to licentiousness for its own sake. He essayed both tragedy and comedy. Of his plays may be cited as representative of him at his best: *The Traitor* (1631), a powerful tragedy; *Hyde Park* (licensed 1632; printed 1637), a comedy; *The Gamester* (1633), a comedy revived by Garrick; *The Lady of Pleasure* (1635), perhaps his most brilliant comedy; *The Cardinal* (licensed 1641; printed 1653), a strong tragedy; *The Sisters* (licensed 1642; printed 1653), a comedy. Of his masques, *The Triumph of Peace*, performed before the King and Queen (1634), is regarded as the best. Consult: *Dramatic Works and Poems* (London, 1833), with notes by Gifford and Dyce; *Shirley*, selected plays, edited by Gosse, in "Mermaid Series" (ib., 1888); A. W. Ward, *History of English Dramatic Literature* (rev. ed., New York, 1899); R. S. Forsythe, *Relations of Shirley's Plays to the Elizabethan Drama* (ib., 1914); H. T. Parlin, *A Study in Shirley's Comedies of London Life* (University of Texas, 1914); A. H. Nason, *James Shirley, Dramatist: A Biographical and Critical Study* (New York, 1915).

**SHIRLEY**, SELINA HASTINGS, COUNTESS OF HUNTINGDON. See HUNTINGDON.

**SHIRLEY**, WILLIAM (1693-1771). An American Colonial Governor, born at Preston in Sussex, England. After being called to the bar he emigrated in 1734 to Massachusetts, where he was appointed a commissioner in the boundary dispute between Massachusetts and Rhode Island, and while acting as such in 1741 was appointed Governor of the Colony. On the outbreak of King George's War he organized the expedition which captured Louisburg in 1745. Soon afterward he persuaded the colonists to apply the money they had received from the British treasury in reimbursement of their expenses on this occasion to the redemption of their paper currency. In 1745 he went to London to urge the settlement of the boundary disputes between the New England and the Canadian colonists and in 1750 was appointed one of the British commissioners in the fruitless negotiations at Paris. In 1753 he was reinstalled as Governor of Massachusetts. On the death of Braddock in 1755 he was appointed commander in chief of the British forces in North America, but was soon called to England. Shirley was promoted to the rank of lieutenant general in 1759 and was for a time Governor of the Bahamas. In 1770 he returned to Massachusetts, where he died. He published a *Journal of the Siege of Louisburg* (1745) and *The Conduct of Gen. William Shirley Briefly Stated* (1758). Consult *Correspondence of William Shirley* (New York, 1912).

**SHIRREFF**, shir'ef, EMILY ANNE ELIZA (1814-97). A pioneer in the movement for the higher education of women and in the development of Fröbelian principles in England. In 1841 Miss Shirreff, with her sister Maria (Mrs. William Grey), published a novel, *Passion and Principle*, dealing with deficiencies in the education of women, and in 1850 the two collaborated in another work, *Thoughts on Self-Culture Addressed to Women*. In 1858 Miss Shirreff published alone *Intellectual Education and its Influence on the Character and Happiness of Women*. She was closely identified with the foundation at Cambridge of Girton College (1869), where she was honorary mistress for a short time, and with the establishment in 1871 of the National Union for Improving the Education of Women of all Classes, which led to the development of the Girls' Public Day Schools Trust in 1872. She was also connected with the founding of the Maria Grey Training College. Her efforts to popularize Fröbel's (q.v.) ideas consisted in the establishment in 1875 of the Fröbel Society and the publication of several works on the subject, including: *Essays and Lectures on the Kindergarten*, *Principles of Frobel's System, and their Bearing on the Higher Education of Women* (1883); *Home Education in Relation to the Kindergarten* (1884); *Short Sketch of the Life of Frobel* (1887); *Kindergarten at Home* (1890).

**SHIRWA**, shēr'wā (CHILWA). A lake in southeast Central Africa, on the boundary between Portuguese East Africa and the British Central African Protectorate, 60 miles southeast of Lake Nyassa (Map: Congo, Belgian, G 6). It is about 40 miles long and 18 miles wide and is surrounded by high mountains. Once a tributary of the Lujenda River, it has, by desiccation, retreated by that system and is to-day a brackish pool of no great depth.

**SHIRWAN**. See DIYALA.

**SHISHAK**, shi'shāk (Heb. *Shishaq* or *Shushaq*; Egypt. *Shoshenk*). A king of Egypt, founder of the twenty-second or Bubastite dynasty and a contemporary of Solomon and Rehoboam (c.960-939 B.C.). His name is found in the portico built by this dynasty at the great temple of Karnak and on several statues of the goddess Pasht, which probably came from Luxor. Jeroboam fled to Shishak from Solomon (1 Kings xi. 26-40); when the latter died he left Egypt and headed the rebellion against Rehoboam which resulted in the division of the Kingdom of David into the two states of Israel and Judah. (1 Kings xii.) In the fifth year of Rehoboam (c.949 B.C.) Shishak, according to the biblical account, marched to Jerusalem with a large army. He took the city, the treasures of the temple, and all the gold bucklers which Solomon had made. (1 Kings xiv. 25-26.) The conquest of Palestine is recorded on the monuments of Karnak, where Shoshenk is represented dragging before the god Ammon three files of prisoners, and various names of places are mentioned. In all no less than 156 Palestinian cities are enumerated by Shoshenk. His expedition, however, is insignificant when compared with Asiatic campaigns of the eighteenth and nineteenth dynasties, and Wellhausen has recently expressed a suspicion that the inscription is only a copy of an earlier list. As no mention is made in it of Jerusalem, and 1 Kings xiv. 25 only speaks of Jerusalem, this is not impossible. Perhaps the most probable view is that Jerusalem occurred

in one of the gaps of the list and that it was expanded freely from an earlier account of Syrian victories. Consult: K. A. Lepsius, *Denkmäler aus Aegypten und Aethiopien* (Berlin, 1850-59); W. Max Müller, *Asien und Europa* (Leipzig, 1893); id., *Egyptological Researches* (Washington, 1906); Rudolf Kittel, *Geschichte des Volkes Israel* (2d ed., Gotha, 1909); Julius Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914).

**SHISMAREF**, shis-mä'rēf. See WALES (Alaska).

**SHITE'POKE'**. See FLY-UP-THE-CREEK; HERON.

**SHITOMIR**. See ZHITOMIR.

**SHIT'TIM WOOD** (Heb. *shittim*, for *shintah*, Ar. *sant*, Egypt. *shant*, acacia tree). The wood of which the Ark of the Covenant was made (Ex. xxv. 10; Deut. x. 3), generally identified with the wood of *Acacia nilotica*, the name (*shittah*, for *shintah*, *sant*) being identical with the old Egyptian word for acacia. This is the characteristic tree of the wilderness of Sinai and the Dead Sea; it grows to the height of 15 to 20 feet and has stiff thorny branches. The wood is hard and well suited for furniture.

**SHIURI**. See SHURI.

**SHIVE'LY**, BENJAMIN FRANKLIN (1857-1916). An American lawyer and legislator, born in St. Joseph Co., Ind. He was educated at the Northern Indiana Normal School and at the University of Michigan, from which he graduated in law in 1886. He was early a farmer, teacher, and editor of a paper at South Bend. Through his editorial writing he became known as a leading member of the antimonopoly party, and, as such, he was elected to fill the unexpired term of Representative Calkins in 1884. Again in Congress, from 1886 until 1892, he was prominent as a radical Democrat. Although resuming law practice at South Bend, he continued active in politics, and in 1909 was elected United States Senator over J. W. Kern, being reelected in 1914. He was chairman of the Committee on Pensions and as Senator Stone's chief aid on the Committee on Foreign Relations he was an important figure during the troubles with the Huerta government of Mexico (1914).

**SHIVEREE**, shiv'er-ē'. See CHARIVARI.

**SHLUHS**. See SHULLUHS.

**SHOA**, shō'ā. A division of Abyssinia, south-east of Anihara (Map: Egypt, D 5). Estimated area, 20,000 square miles. Pop. (est.), 1,000,000. It is an elevated country watered by the Hawash and the Blue Nile. It contains Addis Abeba, the capital of Abyssinia, and the town of Anko-bar. Before the unification of Abyssinia under Menelek in 1889, Shoa was a separate kingdom. See ABYSSINIA.

**SHOALS**, shōlz, ISLES OF. See ISLES OF SHOALS.

**SHOCK** (MDutch *schock*, Dutch, *schok*, OHG. *scoc*, shock, jolt; connected with AS. *scacan*, *sceacan*, Eng. *shake*). A sudden depression of vital power due to injury or profound mental emotions. Through this depression of the nerve centres a circulatory paresis is induced, resulting in the accumulation of the blood in the large abdominal vessels, with corresponding loss to the cerebral and peripheral circulation. This is shown by the lowering of the surface temperature and disturbance of voluntary cerebration. Shock may be slight and transient, or severe and prolonged, or almost instantly

fatal. Surgical shock results from accidental injuries—extensive burns, gunshot wounds, crushing of the limbs, a blow or penetrating wound of the abdomen, injuries to the base of the skull, with concussion of the brain. It is apt to follow extensive operations, especially those upon the abdominal viscera. Sudden and profuse hemorrhage and occasionally anæsthetics cause shock. Crile has attempted to prove by extensive research that surgical shock is due to subconscious pain impressions upon the great nerve centres, inflicted while the individual is under general anæsthesia. His theories, while ingenious, have not found support among surgeons. Mental shock is induced by sudden grief, fright, or other powerful mental impressions. Its condition is denoted by subnormal temperature, rapid and feeble pulse, pinched features, skin cold, pallid, and clammy, or covered with profuse perspiration, shallow and irregular respiration, loss of sensibility to pain, and tendency to urinary suppression. The patient may be conscious, replying to questions, but with no volition either of movement or speech. Delirium is sometimes present and, in children, convulsions. Shock is increased by cold, loss of blood, and age. Recovery is followed by a period of reaction, which is indicated by returning color, increased temperature, and improvement in pulse, respiration, and inclination to voluntary movement. Deferred shock is a curious condition in which the symptoms do not develop until some time after the occurrence of a violent mental impression. This variety may be more severe than that produced by bodily injury.

The treatment of collapse is as follows: the patient is placed in a horizontal position with the head slightly lowered and the feet raised. Surface temperature is maintained by hot-water bottles and blankets. Hypodermic injections of brandy, ether, strychnine, atropine, or digitalis are given according to indications. Hot coffee or brandy may be given by the mouth, the stomach retaining these better than anything else. A useful and frequently employed measure in shock is the injection either into the veins, rectum, or connective tissues of warm, normal saline solution. Large quantities of fluid may thus be taken into the circulation, with generally quick and certain results. In severe cases bandaging the limbs in order to increase the blood supply of the brain and vital centres is helpful. Operation should never be done during shock except when imperatively necessary to save life. Consult G. W. Crile, *The Emotions* (Philadelphia, 1915).

**SHODDY** (probably a variant of dialectic *shode*, shedding, separation, from AS. *scēad*, separation, from *scēadan*, Goth. *skaidan*, OHG. *sceidan*, Ger. *scheiden*, to separate; connected with Lith. *skėdan*, I separate, Lat. *scindere*, Gk. *σχίζω*, *schizein*, Skt. *chid*, to split). A generic term referring to reclaimed wool and cotton fibre of any sort. Such fibre may be obtained by passing rags of wool, worsted, or union fabrics, tailors' clippings, and various mill wastes through pickers, so that they are reduced to a fibrous form and can be mixed with new wool and spun into yarn. In England and America the term "shoddy" is applied to the fibre manufactured from yarn and soft products, "mungo" to that from hard-spun fabrics, and "wool extract" to that obtained from union or cotton-mixed fabrics, by carbonizing the cotton

fibre with chemicals. The mills manufacturing shoddy also make a considerable quantity of flocks, which consists of short refuse wool, shearing of woolen goods, or wool dust, and is employed for weighting certain kinds of woolen cloth and coating of waterproof garments, in the surfacing of wall papers, and for other purposes. The shoddy industry in the United States, according to the Thirteenth United States Census, in 1909 involved 88 establishments, with a capital of \$6,886,825, producing a product valued at \$7,446,364, from raw material valued at \$3,000,706. The shoddy industry is quite important, and the utilization of waste products has a legitimate use, not only in adulterating and cheapening woolen cloths, but in making certain light fabrics, which have their special purposes. Consult "Manufactures," in *Thirteenth Census of the United States*, vol. x (Washington, 1913).

**SHOEBILL**, or **WHALEHEAD**. A large remarkable, heron-like, grayish bird (*Baleniceps rex*) from the White Nile in eastern Africa. It is made the type of a special family, the *Balenicipitidae*, but is closely allied to the umbrette (q.v.). The most peculiar external feature is the huge blotched yellow bill, longer than the head and shaped like a shoe. These birds feed on fish and snakes and also the viscera of dead mammals, ripping open the carcass with the hook tipping the upper mandible. Consult Alfred Newton, *Dictionary of Birds* (London, 1893-96), and authorities there cited.

**SHOE BLACKING**. See **BLACKING**.

**SHOES** (Ger. *Schuh*, Swed. and Dan. *sko*, AS. *scoo*, Fr. *soulier*, It. *scarpa*, Sp. *zapato*). A general word for foot coverings, especially those with stiff sole and soft upper. Boots have a closed or laced upper reaching to the calf or higher. The earliest and simplest shoe is the sandal, a sole without upper, fastened to the foot by straps and protecting only its bottom. A primitive shoe protecting the top of the foot also is the Indian moccasin, usually soft soled and often made of a single piece of leather. By European peasants and by workers in dye-houses and chemical factories wooden shoes (sabots) or shoes with wooden sole and leather upper (clogs or pattens) are much worn. Expensive clogs with fancy uppers are used by clog dancers on the modern vaudeville stage. The ancient Egyptians wore sandals of leather, papyrus, or plaited straw, sometimes turned up in front to protect the toes. But the Hittites wore shoes, often with gaiters above to protect ankle and calf. Boots as well as shoes were used by Assyrians and Egyptians in war, on journeys through rocky districts, or where special protection was desired. Slaves and the lower classes usually went barefoot.

Among the Greeks the poorer classes commonly wore cheap and simple shoes, the upper classes sandals; there were slippers for the ladies and high laced boots for hunting and traveling, as well as boots with high soles for actors in tragedy. While the Romans often wore sandals or soft shoes for dress, they had a special shoe (*calceus*) with slits at the sides and straps laced in front, of red leather for patricians and black for senators. The soldier's *caliga* was a heavy hobnailed sandal, with straps wound around the foot and ankle. During the Middle Ages most shoes had soft uppers, sometimes closed to the ankle or higher, but frequently open down the front, and laced over

with decorative straps. Stocking boots, woolen gaiter shoes, and simple leather soles sewed to the feet of tights were also worn. Tops of high shoes and boots were often folded over or trimmed with fur. During the thirteenth century pointed toes of shoes increased constantly in length, reaching the extreme in the fourteenth century, when the points were sometimes turned up and back and tied to a garter just below the knee. Sometimes the pointed toes were made to curl out, giving a splay-footed effect. High wooden clogs were worn to exalt the stature. In the last quarter of the fifteenth century pointed toes began to be succeeded by round ones that in the first quarter of the sixteenth century became broad and almost square. Boots were worn soft and with roll top, some reaching high up on the thigh, the more fashionable ones only to the calf. Heels came definitely into vogue during the reign of Queen Elizabeth, some of these for ladies being very high, almost like the French heels of to-day; thick soles were much worn. The buskins of Elizabeth preserved at Oxford must have increased her apparent height at least 3 inches. Shoes also became narrow with oval toes almost pointed, and the fronts of the uppers were decorated with pricking and slashing, and often with jewels. Short leather boots with fur tops and long boots with serrated tops are noteworthy features of nobles' costumes.

In James I's time shoes became fuller and rounder at the toes, mostly with thick welted soles and short heels or none. They were fastened with a large rosette of gold lace or ribbon in front and the latches set back to show an open side. Top-boots were close fitting with square toes. During the reign of Charles I the toes of shoes became squarer, even blocked, and the fronts were set with rosettes of silk, silver and gold lace, the heels varying in height, but often large and low. Boots coming well above the knee had tops turned down and sometimes trimmed with lace or gold braid. Late in the seventeenth century heels became high and toes pointed, and latches were elaborately tied or buckled.

In the time of George III men wore boots with long brown tops and high boots with curved tops and a gold tassel in front. Heels of shoes were low, toes a pointed oval, and latches and buckles low on the instep. Ladies' shoes about 1760 were on high spindle heels and had large buckles and round toes until 1780, when latches went out, toes became pointed, and heels small. About 1800 the heels practically disappeared, the soles assumed quaint shapes, and shoes were attached sandal fashion by ribbons around the ankle. From 1840 on ladies' shoes began to have heels again and large rosettes. About 1870 came round toes with low, round front and bow, high heels, and high shoes either buttoned or laced. In comparing shoes of to-day with those made by hand before machines were introduced, the extent to which they are shaped is noticeable. The collection of historic shoes in the Cluny Museum at Paris is noteworthy.

**Shoe Manufacture**. The manufacture of shoes in the United States was established in 1629 by Thomas Beard, who came over with hides, both upper and bottom, in the *Mayflower*, on its third voyage, charged to the Governor of the Colony by the company in London at a salary of \$50 a year and a grant of 50 acres

of land. Seven years later Philip Kertland of Buckinghamshire began to make shoes in Lynn, and ever since Massachusetts has led in the boot and shoe industry. For two centuries the shoemaker was often an itinerant workman who journeyed from one farmer's family to another, tarrying long enough to convert the farmer's supply of home-tanned leather into foot coverings. When he settled down and had a shop of his own, he sat on a low bench, one end of which was divided up into compartments where his knives, awls, hammers, and rasps were kept, and there was also room for his pots of paste and of blacking, his shoulder sticks for setting the edges of heel and sole, and rub sticks for finishing the bottom; tacks, pegs, nails, thread, wax, buttons, and linings. Close by he kept a dish called a higgins in which was placed the water to wet the soles, a pair of clamps to hold the uppers supported between his knees, while he seamed or bound them, and also the strap which, passing under his foot, held the sole upon the last and both on his knee while he stitched on the welt and upper.

In making a sewed shoe by hand the leather is first solidified by hammering or rolling; it must be skived, i.e., trimmed down to a uniform thickness, and all imperfections cut away; the parts must be cut out and the different portions composing the upper sewed together. (The sole consists of two portions: the insole of soft and the outer sole of heavier leather. The insole, rendered pliant by soaking in water, is first tacked to the last. Next its outer edge a channel, called a feather, is dug about  $\frac{3}{8}$  inch deep, along which holes for the stitches are pierced obliquely through the leather into the channel. The top is next lasted, an operation requiring great skill. The welt is then placed around the sole as far as the heel, and then the upper welt and insole are sewed together in one seam. The bottom is then leveled up by filling in the depressed portion formed by the welt with tarred paper or other material. The outer sole, first soaked and then thoroughly hammered on the lapstone, is now temporarily tacked to the insole. A narrow channel is then cut around the edge, through which the sole is stitched to the welt. The heel, several layers, or lifts, is now nailed to the sole, and the shoe is ready for final processes: trimming, polishing, etc.)

The first invention that materially changed the methods of the shoemaker was the use of wooden pegs instead of thread for fastening soles and uppers together. With their adoption about 1815 on the cheaper grades the development of the modern shoe factory began. At first only a small portion of the work was done in the general factory, the rest being performed in private homes, or in shops as before, but with this difference—that the shoes were to be sold at wholesale, ready-made, and not according to the orders of customers. Shoemaking was divided into three parts: cutting, binding, and bottoming. The cutting was done at the central factory; the uppers sent out to one set of workmen, often women and children, to be sewed in their homes; lastly the bottoms and uppers were sent out to local shoemakers, who, in their little shops, formed what was known as a team of workmen and put the parts together, one man doing the lasting, another the pegging, and a third the trimming.

About 1850 the rolling machine was intro-

duced, by which the sole leather is thoroughly compressed in a minute, a process which had required an hour's time of laborious pounding with hammer and lapstone. Later the Howe sewing machine was adapted to the sewing of the leather uppers. About the same time horse power, and soon after steam power, was applied to the running of shoemaking machinery, and with the adoption of the latter the various branches of shoemaking were gathered under one roof. In 1860 the McKay sewing machine, for sewing uppers and soles together, was introduced and at once revolutionized the business. (See SEWING MACHINE.) An improvement upon this was the Goodyear welt machine, introduced about 1877, by means of which uppers and soles are secured by means of a welt, as previously described. In 1881 the invention of the Reese buttonhole machine still further narrowed the sphere of hand sewing in the manufacture of shoes. Of the other earlier inventions the more important are: the cable screw-wire machine for fastening uppers and soles together (1860); Bigelow's and McKay's heeling machines (1870); and the edge-trimming machines (1876). Since then polishers and trimmers and many other important machines have been added.

In the first room of a modern factory the sole leather is first run through a skiving machine, which pares the leather to a uniform thickness, rejecting thin and ragged portions. It is then solidified in a rolling machine, after which the soles may be cut, either by means of dies operated by a steam hammer or by machine-driven knives, which follow rapidly around a pattern laid on the leather. The heels are also cut by dies and various forms of machinery in use for building them up. The cutting of the uppers, as of the soles and linings, is often done by dies or other cutting machinery. The best work is usually done with a knife by hand, to make sure that the parts are cut the right way of the grain and from a portion of skin of uniform texture. The tips are cut by punching machines with many different dies, according to shape and patterning. In the stitching room the sewing machines are driven by power, often with a separate operator and machine for each seam. In the bottoming room uppers are lasted and soled and then heeled.

By one method of heeling the lifts are nailed together by a nailing machine, which cuts the wire off the reel and drives it through the heel. By another the heel, instead of being built up separately and then secured, is built up on the boot, and when the top piece is on, the heel is pared and the front curve or breast formed. The final shaping of the heel involves several manipulations. In the fifth room final trimming and polishing are conducted, the trimming effected by specially adjusted, rapidly revolving wheels, the final polishing by machine-driven burnishers, sandpaperers, and other devices. Last of all, if desired, the shoe is coated with liquid polish and rubbed with a hot iron. If a dull finish is wanted, as in calfskin, the shoe is rubbed with grease and then with an ebony stick. When shoes are screwed or riveted, the process is somewhat changed. In riveted work no welt is used. In screwing, a reel of stout wire is provided with a screw thread, which is driven by the machine through outer sole, inner sole, and upper, and then cut off evenly. This makes a strong, durable shoe. A

great variety of leathers is used in making shoes, including alligator, lizard, snake, and monkey skins, as well as the more common kinds—suede, moose buckskin, deerskin, and patent or enameled leathers, and these may be colored, according to the demands of fashion or the purposes for which they are intended. Cloth is also used for shoes and slippers, according to the vogue.

**Rubber Shoes.** An important branch of shoe manufacture is the making of waterproof boots and overshoes out of rubber. The raw rubber, received at the factory in crude lumps, is ground and washed and rolled into sheets. The sulphur necessary for vulcanization, lampblack for coloring, and sometimes other ingredients are added, after which the sheets are passed through heated rollers, which reduce them to a thickness of less than one-third of an inch. A cloth backing is then applied by simply laying the rubber on the cloth and subjecting it to great pressure under a cloth-calendering machine. Out of this cloth the rubbers are cut, a different thickness of fabric for sole, heel, and upper, and the parts are skillfully joined over wooden lasts. This is not done by sewing, but by using some solvent, as turpentine, which causes the edges to adhere. The shoes are then covered with a coat of rubber varnish and vulcanized (see RUBBER), after which they are ready for the market.

**Statistics.** The value of the leather boots and shoes, including cut stock and findings, manufactured in the United States increased from 177 million dollars in 1879 to 245 in 1889, 290 in 1899, 357 in 1904, 513 in 1909, and from 125 million pairs in 1879 to 285 in 1909. The value of rubber boots and shoes manufactured in 1909 was 50 million dollars. The exports of boots and shoes increased from 663 thousand dollars in 1890 to 4 millions in 1900, 8 millions in 1905, 12 millions in 1910, and 24 millions in 1915. The value of rubber boots and shoes exported in 1915 was 3 million dollars. The cities that led in the manufacture in 1909 were Lynn with 47 million dollars, Brockton with 39, St. Louis with 34, Haverhill with 29, Boston with 26.

Rhead, *Chats on Costume* (ib., 1906); Talbot Hughes, *Dress Design* (ib., 1913); Leno, *Art of Boot and Shoe Making* (London, 1889); Golding, *The Manufacture of Boots and Shoes* (ib., 1902); W. H. Dooley, *A Manual of Shoemaking and Leather and Rubber Products* (Boston, 1912); also "Manufactures," in *United States Census Reports* (Washington).

**SHOGUN**, shō'gōon (Sinico-Jap., generalissimo). The title adopted in Japan for the general commanding each of the four divisions of the Empire in early times. In 1192 Minamoto Yoritomo (q.v.) was given the title Sei-i-Tai-Shogun (Barbarian-quelling Great General). By degrees the Shogun became independent of the Emperor, so that in the hands of the Tokugawa family (1603-1868) the shogunate became the de facto ruling power in the country. After having been held successively by four great military clans for nearly 700 years, the office was abolished in 1868. For some years after 1853 the Shogun was known to foreigners as the Tycoon.

**SHOLAPUR**, shō'lā-pōor'. The capital of the District of Sholapur in the Province of Bombay, India, 60 miles north by east of Bijapur

(Map: India, C 6). The ruins of the old fort, dating from 1345, a high school, two parks, and a large bazar are noteworthy. The city is an important distributing point for the agricultural products of the region and manufactures cotton goods, blankets, silks, etc. Pop., 1911, 61,345. In 1818 Sholapur was the scene of the decisive victory of the British forces under Munro over the forces of the Baji Rao.

**SHONTS**, THEODORE PERRY (1856-1919). An American railway official, born in Crawford Co., Pa. He graduated at Monmouth (Ill.) College in 1876. He studied and practiced law, but subsequently engaged in the construction of railroad lines, now parts of the Iowa Central and Burlington systems. In April, 1905, he was appointed by President Roosevelt chairman of the Isthmian Canal Commission and in that connection had an important part in formulating plans for the canal. (See PANAMA CANAL.) He resigned this post in January, 1907, when he became president of the Interborough-Metropolitan (transit) Company, New York City. Shonts served as president also of the Toledo, St. Louis, and Western Railroad after 1904, of the Chicago and Alton in 1909-12, and of the Iowa Central and the Minneapolis and St. Louis in 1909-11. In addition he was chosen president of the New York Railways Company and of the Rapid Transit Subway Construction Company and an officer in other corporations.

**SHOOTING.** See TARGET AND TARGET PRACTICE.

**SHOOTING STARS.** See METEOR; METEORITE.

**SHOOTING STARS.** See PRIMULACEÆ.

**SHOPHAR**, shō'fār. See Plate of MUSICAL INSTRUMENTS.

**SHORE** (probably connected with AS. *sceran*, *sciran*, *sceoran*, to cut off, Eng. *shear*, *shire*). The margin between the land area of the earth and the water area. The outline and general character of continental shores are modified chiefly in two ways. 1. By erosive and transporting action of the sea, whose waves, currents, and tides are constantly removing rock materials in one place and depositing them in another. Thus seaward edges of strata are cut back to form cliffs, sometimes producing an irregular shore line, with headlands and deep reentrants; the land waste brought down by rivers is distributed over the ocean floor, and beaches and sand reefs are formed. 2. By secular movements of the earth's crust through which the land level, with respect to the sea, is changed. Coastal lands thus upraised from the sea floor are generally formed of soft strata, but, owing to their low position, they markedly resist erosion. Moreover, as the waters deepen gradually offshore, the waves beat up the sands from the bottom, forming long reefs, and the sediments transported by rivers accumulate as deltas, so that such shores have additional protection from wasting action. The coastal plain of Texas affords an example of such a shore-line. For most of its length it is low, monotonously level, and fringed by sand reefs, which are so little interrupted that to admit deep-sea vessels Galveston has been built on an outer reef. The peculiar shore line of North Carolina, indented by shallow sounds and bordered by reefs, has been formed by gradual depression of an uplifted and dissected sea bottom. Coastal lands that have been subjected to marked depression are usually charac-

terized by an irregular shore line with rocky headlands, numerous harbors, and outlying islands, thus contrasting strongly with the shores of uplifted regions. This follows from the fact that the surface of such lands is diversified through the constant process of erosion, while the ocean floor is comparatively smooth and unbroken. The western coast of Norway owes its irregular outline to the depression of a mountainous land surface by which the valleys have been submerged by the sea forming long, deep reëntnants, called fjords. See BEACHES, LAISED; DELTA; FIORD; SHORE PROTECTION.

**SHORE, JANE** (1445-1527). Mistress of Edward IV of England. She was born in London and was married to a goldsmith named William Shore. She met Edward IV about 1470. After his death she was accused of witchcraft by the Duke of Gloucester (later Richard III) and, suspected of favoring the young princes, was committed for a time to the Tower. She lived till after the accession of Henry VIII and died in penury and obscurity.

**SHORE, JOHN.** See TEIGNMOUTH, BARON.

**SHORE, W. TEIGNMOUTH** (1865- ). An English author, educated at Westminster School and at Oxford. He was connected with the editorial department of the publishing house of Cassell & Co. for many years and also with a department of the *London Times*, in 1903-05 was editor of the *Academy* and of *Literature*, and also became known as a business man. Among his writings—novels, biography, travels, plays—are: *The Talking Master* (1904); *Canterbury* (1907); *Kent* (1907); *Charles Dickens and his Friends* (1909); *The Pest* (1909); *Creatures of Clay* (1911); *D'Orsay, or the Complete Dandy* (1911); *John Woolman: His Life and our Times* (1913).

**SHORE BIRDS, or BEACH BIRDS.** A sportsman's term for those birds which run along the beaches of the sea or inland bodies of water and pick up their food from the edge of the waves. All are of the order Limicolæ (q.v.) and (so far as they interest sportsmen) consist mainly of sandpipers, curlews, stilts, plovers, and their nearer allies. They are shot mainly by hiding in blinds at favorable places and setting out decoys to attract the migrating flocks. Consult, in addition to general ornithologies, any of many special works by both ornithologists and sportsmen, as Seebohm, *Geographical Distribution of the Family Charadriidæ* (London, 1887), in which are described and largely figured all the shore birds of the world; D. G. Elliot, *North American Shore-Birds* (New York, 1898); H. K. Job, *Among the Water Fowl* (ib., 1902).

**SHORE/DITCH.** A borough of London, England, immediately north of the city nucleus. Within its limits is the immense freight depot of the Great Eastern Railway. The two theatres in London during Shakespeare's time were in Shoreditch. The name is probably derived from Sir John Soersditch, who had his residence here in the reign of Edward III.

**SHORE LARK, or HORNED LARK.** The only true lark (*Otocoris alpestris*), i.e., a lark of the family Alaudidæ, indigenous to North America. It ranges in its migrations over the entire continent, breeding in Canada, Alaska, and the elevated plateau regions of the West and appearing along the coasts, about the Great Lakes, and southward in open districts in winter. It is a small, handsome, and highly variable bird, the characteristic feature of which

is an erectile, narrow, hornlike tuft of lengthened black feathers on each side of the crown. The plumage of the adult consists of mingled brown and vinaceous tints above, with the lower parts mainly white and bold black markings on the head and chest. (See Plate of LARKS AND STARLINGS.) Those living on the Western plains, where they are numerous and sociable, are far paler than the northern and eastern residents. All make their nests on the ground and lay brown-speckled eggs. These larks have a brilliant song, which is often heard while they flutter high in the air like skylarks. Consult American ornithologies, especially: Elliott Coues, *Birds of the Northwest* (Washington, 1874); L. S. Keyser, *Birds of the Rockies* (Chicago, 1902); H. C. Oberholser, "A Review of the Larks of the Genus *Otocoris*," in *United States National Museum, Proceedings*, vol. xxiv (Washington, 1902).

**SHORE PLANTS.** See BEACH PLANTS.

**SHORE PROTECTION.** The destructive action of ocean and lake waves on beach and shore structure is of two types, that due to the heavy impact of storm waves, and that due to steady wearing away of the foreshore. The former is spectacular and does the more obvious damage because it acts suddenly and with great force, but the latter is far more important as a destructive agency, for it is constant and insidious, and the danger is apt not to be apparent to the nonexpert observer. Storm waves can apparently be combated by construction of heavy sea walls or bulkheads, which while of only temporary value are easily built and act in an easily understood manner. Coast erosion also can generally be prevented by simple measures, but those measures are not so obvious and hence are not so often resorted to.

About nine-tenths of the coast lines of the world are fringed with sand. Under the constant motion of the wind-driven water this sand is moving back and forth on the beach, following the wave track. If these waves always moved parallel to the shore line, the sand movement would be unimportant because it would only move back and forth in one location, but owing to variation in the direction of winds and to inequalities in the submarine shore there are set up littoral currents which carry the sand along the shore in one general direction—tearing down the beach at one place to build it up at another. Thus unprotected coast lines are always changing, to the detriment of such structures as man builds alongshore. The problem of shore protection, then, is not only to provide some material barrier to intercept high seas which occasionally reach beyond the normal shore line, but also to build such structures, or to assist nature to build them, as will prevent the gradual destruction of the natural beach, upon which normally the force of the waves is broken.

If it is necessary to maintain structures near the natural shore line where heavy seas break, a sea wall of some sort must be built. It should be of masonry, to resist the heavy force of breaking water, and should be well founded, generally on piles, to increase its stability and to prevent undermining. Generally it is filled in behind the level of its top and the shore structures built at that level, so that in addition to resisting the sea on one face it has to act as a retaining wall on its land side. Such a wall preferably should be shaped on its water

side so as to have three parts, all curving together to make a smooth face best adapted to counteract the driving waves. These parts are an apron, the lowest section of the wall, an almost flat paving gradually approaching the beach below; a deflector, a concave surface which will turn the approaching wave from the horizontal towards the vertical; and a parapet or overhanging top section which will return the water to the sea with a reduction of its energy. Such a wall will turn back heavy seas with the least pressure on itself and the least danger to shore structures from overtopping water.

All large and effective sea walls of the world are built in some variation of this section, but unfortunately many walls are mere bulkheads, vertical barriers of wood or stone which readily fail under the terrific impact of storm waves. The many bulkhead failures in the summer-resort sections of both Atlantic and Pacific coasts are testimony to faulty construction.

As a necessary complement to sea walls where deep water is not required just off the wall, and as a sole defense against erosion at those locations where a long sloping beach without shoreline structures is permissible, some sort of protection can be built to prevent the destruction or movement of the foreshore under the littoral currents. The accepted form of such construction is the groin, sometimes miscalled jetty (q.v.).

Groins are low walls or fences extending out into the ocean from the beach to be protected. Their purpose is to intercept littoral currents and confine the movement of the foreshore sand to a backward and forward movement up and down the beach. There are two results of this action: the existing sand never moves from its restricted location between the adjoining groins, and the sand carried in suspension by the incoming waves is deposited between the groins by the slowing of the currents there. In consequence, when correctly built, groins not only prevent erosion, but in fact build up the beach. Groins should be built of some strong material such as timber or reinforced concrete in the form of a closed fence, i.e., with frequent posts spanned by boards reaching down into the sand. They should extend from the high to the low water line and on occasion out into low water and should be spaced about as far apart as the distance from high to low water. In general they should extend at right angles to the shore, because any other direction tends to concentrate the component of the littoral drift along the groin and to cause erosion there. As to height, there is some argument among experts, but the more accepted practice is to build them at first on a slope parallel to that of the beach and not over 2 or 3 feet high and to add to their height as the sand builds up around them. High groins have to be built stronger to resist wave impact; quite often they tend to develop irregular accumulation of the built-up sand.

Another method of preventing shore erosion is to assist nature to build up a sand dune on shore to form a natural bulkhead or sea wall. This can be done only where the immediate shore is not in use. To create a sand dune a fence with horizontal palings an inch or two apart can be erected parallel to the shore some 100 feet inland. Sand carried onshore is piled up naturally on both sides of this fence, and a dune forms. This dune may then be protected

against erosion of wind and wave by planting tough, hardy grasses. A further precaution sometimes resorted to is the construction of an offshore wave screen either in the form of a heavy masonry breakwater or a timber fencing. The former is very expensive and is permissible only where harbor requirements demand smooth water; the latter is fragile and rarely can be built strong enough to resist storm conditions. For modern shore protection, consult the current files of the engineering press, such as *Engineering News* (New York), *Engineering Record* (ib.), *Engineering* (London), and proceedings of the various engineering societies.

**SHOREY, PAUL** (1857- ). An American classical scholar, born at Davenport, Iowa. After graduating from Harvard in 1878 he studied at Leipzig, Bonn, Athens, and Munich (Ph.D., 1884). From 1885 to 1892 he was professor of Greek at Bryn Mawr College and thereafter at the University of Chicago. In 1901-02 he was professor in the American School of Classical Studies at Athens, and in 1913-14 he was, by appointment of Columbia University, Roosevelt professor in the University of Berlin. From 1908 he was managing editor of *Classical Philology* and a frequent contributor to its columns. He was made a member of the National Institute of Arts and Letters. His studies are chiefly in the field of ancient philosophy, particularly Platonism. He published: *De Platonis Idearum Doctrina* (1884); *The Idea of God in Plato's Republic* (1895); *The Unity of Plato's Thought* (1903); an edition of Horace's *Odes and Epodes* (1898; revised, with Laing, 1910).

**SHORT.** A term used to denote brokers, dealers, and speculators in stocks, certificates of indebtedness, or any commodity, who agree to sell or contract to deliver shares, etc., which at the time they do not own, and who to do so are forced to borrow the same for a consideration and eventually to cover by actual purchase or by an equitable settlement with the buyer. If the market value of the stock or commodity falls, the short profits by purchasing the same at a lower price, thus making the difference, whereas on a rising market he will lose, as he is forced to pay more for the stock or commodity than he received in the original sale. See CORNER; MARGIN DEALS; STOCK EXCHANGE.

**SHORT, SIR FRANCIS JOB** (1857- ). An English engraver and water-color painter. He was born at Stourbridge, Worcestershire, and was trained to be an engineer, but in 1883 turned to art and studied at the South Kensington and Westminster schools. One of the foremost engravers of his time, he made himself master of every medium, but accomplished most in mezzotint. His work is characterized by harmonious simplicity of line and delicacy of tone. He frequently combines mezzotint and etching, as in his plates after Turner's *Liber Studiorum* (1885), his first work of importance. Among his original mezzotints are "Nithsdale," "Ebb-Tide, Putney Bridge," and the "Weary Moon." As a professor of engraving at the Royal College of Art he greatly influenced the younger generation. In 1910 he became president of the Royal Society of Painter-Etchers, and in 1911 he was elected a Royal Academician and was knighted. He received gold medals at Paris in 1889 and 1900.

**SHORT, WILLIAM** (1759-1849). An American diplomatist, born at Spring Garden, Surry

Co., Va. In 1784 he went to France as Secretary of Legation under Jefferson. In 1790 he was appointed a commissioner to negotiate European loans for refunding the national debt. He was Minister Resident at The Hague in 1792, and later that year he and William Carmichael were appointed commissioners plenipotentiary to treat with Spain concerning the navigation of the Mississippi, boundaries, and commerce. Short's commission was changed in 1794 to Minister Resident at Madrid, where he remained until 1796. He returned to America in 1802. His residence abroad and his relations with the French nobility made him unpopular at home. In 1808 Jefferson nominated him as the first United States Minister at St. Petersburg, but the Senate refused confirmation, and in 1810 he returned to the United States.

**SHORT BALLOT.** See **ELECTORAL REFORM.**

**SHORTER, CLEMENT KING** (1857-1928). A London journalist and literary biographer. He was born in London and from 1877 to 1890 was in the civil service. Afterward he was editor of the *Illustrated London News* (1891-1900), the *Sketch* (1893-99), and the *English Illustrated Magazine* (1894-1900). In 1900 he established the *Sphere*, an illustrated literary weekly. Shorter is best known for his Brontë studies, comprising *Charlotte Brontë and her Circle* (1896), a new edition of Mrs. Gaskell's *Charlotte Brontë* (1900), *Charlotte Brontë and her Sisters* (1905), *The Brontës: Life and Letters* (2 vols., 1907), and *Complete Poems of Emily Brontë* (1911). He published besides: *Sixty Years of Victorian Literature* (1897); *Immortal Memories* (1907); *George Borrow and his Circle* (1913); etc. For his wife, see **SHORTER, DORA.**

**SHORTER, DORA** (SIGERSON) (1872- ). An Irish novelist and poet, daughter of Dr. George Sigerson (q.v.), born in Dublin. She became identified with the Irish Literary Revival. (See **IRISH LITERATURE**, *Irish Literature in English*.) In 1896 she married Clement K. Shorter. Her first distinction is as a lyric poet of spontaneity, with an unmistakable note of nationality in her verse. Her publications include: *Verses* (1894); *The Fairy Changeling and Other Poems* (1897); *Ballads and Poems* (1899); *The Father Confessor* (1900); *The Woman who Went to Hell* (1902); *The Country House Party* (1905); *Through Wintry Terrors* (1907); *Collected Poems* (1909); *Madge Lindsley and Other Poems* (1913). Consult S. A. Brooke and T. W. Rolleston, *Treasury of Irish Poetry* (New York, 1900), and William Archer, *Poets of the Younger Generation* (ib., 1902).

**SHORTHAND.** A common English word used for any system of writing sufficiently brief to enable a writer to keep pace with human utterance. It usually differs from longhand by providing a single stroke, either straight or curved, to represent each distinct sound in the language and by the omission of silent letters. The various systems are usually separated into the following divisions: (a) the alphabet, including characters for the representation of consonants, vowels, and diphthongs; (b) expedients, making use of auxiliary material such as compound strokes and strokes of varying lengths and thicknesses to secure a maximum of brevity without diminishing legibility; (c) abbreviating principles whereby the most suggestive part of a word may be substituted for the complete outline; (d) the union of two or more words in one outline, technically known as phrasing. The

hand of the average trained shorthand writer is capable of executing from 400 to 500 pen motions per minute. By dividing this number by the rate of speed desired the number of motions which may be allotted to each word is determined. Existing practical systems of to-day are enabled to meet the demands of legibility by an average of from two to three motions per word.

**Early History.** In common with many other valuable acquisitions of mankind the origin of the art of brief writing is clouded in mystery. From references made to skilled writers in ancient literature some have inferred that the art was practiced long prior to the Christian era. No authentic record exists, however, establishing its practical use much before the first century B.C.

From sources whose authority cannot be questioned we learn that the art flourished extensively throughout the Roman Empire during the first century B.C. and continued to be practiced for at least 400 years afterward.

The pioneer of Roman shorthand was Marcus Tullius Tiro, the secretary and librarian of Cicero. Tiro was born about 103 B.C. at Arpinum, a city south of Rome. He was a slave belonging to the father of Cicero. At the age of seven he was brought to Rome and educated on equal terms with the children of his master. On the death of Cicero's father (68 B.C.) Tiro became the confidential secretary of the great orator. Six years later he received his freedom and, as was the custom, took the name of his former master. The system of shorthand devised by him was at first little more than an extensive list of abbreviations. Subsequently it was improved to such an extent that by writing in relays the reporters of the period were enabled to keep pace with a speaker. Roman poets, among them being Martial and Ausonius, make frequent reference to shorthand writers.

The chief use of shorthand in Roman times was made by the leaders in the Church and by the officials of the government. The official titles used were *notarii* for those who took dictation, *librarii* for those who transcribed notes, and *exceptores* for functionaries attached to the civil officers of the government. Church dignitaries making conspicuous use of shorthand were St. Augustine, Origen, and St. Jerome. The latter employed 10 shorthand secretaries. All of the Roman emperors employed shorthand writers, and several of them attempted to learn it, notably Titus and Julius Caesar.

Tironian notes gradually fell into disuse from the fifth to the ninth centuries, at which time Latin was being displaced by the common tongue. The system grew from a vocabulary of 5000 characters in the time of Seneca to more than 13,000 when it ceased to be used.

The art was entirely lost to view from this time to the end of the fifteenth century, when John Trithemius, abbot of Spanheim, discovered a codex in the cloister at that place. He also discovered a copy of the Psalms in the library at Wolfenbüttel, Germany. Trithemius did not succeed in resolving the characters of the Tironian notes into their alphabetic elements. That was not accomplished until nearly 300 years afterward. Among those to whom we are indebted for our knowledge of the Tironian notes are Jan Gruter, 1603; Kaspar Schott, 1644; Montfaucon, 1708; Carpentier, 1747; Ulrich Frederick Kopp, 1817; Mabillon, 1881.

**Modern Shorthand.** This dates its birth from 1588, when Dr. Timothy Bright produced a system to which he gave the title *Characterie; the art of short, swift, and secret writing, by character*. Printed at London, in 12mo, by J. Wandate, an assign of Timothy Bright, with the privilege of the Queen, forbidding all others to print the same. This treatise was dedicated to Queen Elizabeth. The book contains a table of several hundred words with their abbreviations. By writing a line in various directions and by using certain appendages the author was enabled to compile a system of abbreviations to represent the more frequently occurring words. As a practical method of writing, however, the system was a total failure.

Fourteen years afterward alphabetic shorthand made its appearance. John Willis in 1602 gave to the world his work, entitled *The Art of Stenographie, or Short Writing by Spelling Characterie*. This system was the foundation for all subsequent ones. But two copies of the first edition of this famous work are now known, one in the Bodleian Library at Oxford and the other in the British Museum. A character is provided for each letter of the alphabet. An acute angle opening downward represents the letter A; the same angle opening to the right represents E; the same angle opening to the left represents the letters J and G. Fourteen editions of this work were published.

The work by Willis was followed soon after by that of Folkingham and Edmund Willis, 1618; Thomas Shelton, 1620; Witt, 1630; Mawd, 1635; Metcalf, 1635. These authors contributed very little in the way of improvement on the system by John Willis. The system of Thomas Shelton is of chief interest at the present time from the fact that the celebrated *Pepys Diary* was written in this style.

In 1642 William Cartwright produced a system which marked a great step in advance. The system was published by the nephew of the author, Jeremiah Rich. Cartwright had evidently been a writer of Shelton's system. He called his work *Semigraphy*. A copy is now to be seen in the British Museum. In 1646 Jeremiah Rich made some slight modifications and reprinted the system under the title *Semigraphy*. Cartwright reduced the number of vowels to four, placing a dot above the stroke in order to represent A, a dot near the head to represent I, a dot near the bottom to represent O, a dot underneath the character to represent U. Cartwright was the first to employ different lengths to represent different letters, e.g., a long dash represented M, a short dash N. To Cartwright and Rich all subsequent authors of geometric shorthand are greatly indebted.

From 1642 to 1707 very little improvement was made in the theory of the art. On the latter date William Mason produced his third and best work on shorthand, entitled *La plume volante*. Mason had long been a teacher and writer of shorthand, his first work appearing in 1672 under the title *A Pen Plucked from an Eagle's Wing*. This was a reprint of the Cartwright-Rich system with a few modifications. In 1682 his second work appeared, and to this he gave the title *Arts Advancement*. A number of improvements appeared in this volume. In the 1707 edition he gave alphabetic signs for *ch*, *sh*, and *th*, and also the small circle as a duplicate character for *s*. He reduced the vowels to three. By placing a dot at the beginning

of a character he represented A and E; by placing a dot in the middle of a character he represented I and Y; by placing a dot at the end of a character he represented O and U. Mason also introduced phrasing in a small way.

From the time of Mason to 1767 some 50 systems made their appearance. Those which possessed any practical value and which were destined to survive the life of the author were based upon the system of Mason, which in turn was an improvement upon the Cartwright-Rich system. Among those worthy of mention were

Elisha Coles, 1674; James Weston, 1727; Aulay Macaulay, 1747; Thomas Gurney, 1750; Holdsworth and Aldridge, 1766. The system of Thomas Gurney is used to the present day to a limited extent in England.

John Byrom, one of the great lights in shorthand history and known by his followers as the Grand Master, was born in 1691. He entered Trinity College at the age of 16. In 1715 he went to France to pursue a course in medicine and about this time took up the study of shorthand. Possessing a discerning mind and tremendous zeal, he was destined to make by far the greatest contribution to the art since the time of John Willis and William Cartwright. His opinion of the then existing systems was expressed in the following words: "First, they are ugly, and second, they are arbitrary." Among the many improvements he made should be men-

tioned (a) adherence to the principle of lineality. (b) The pairing of consonants, as follows: P B, S Z, T D, K G, F V, Sh Zh, Th Dh, Ch J. He did not attempt, however, to represent these letters by paired strokes and permitted one character to represent both letters in some cases. (c) The elimination of shading or thickening of strokes. (d) Duplicate characters were provided, e.g., L is represented by three different strokes. (e) Vowels were indicated by dots in five different positions, initial and final vowels only being expressed. (f) The use of position writing, a detached sign deriving its meaning from its position with relation to the writing line.

Byrom was a fellow of the Royal Society and founded the first Shorthand Association. Considerable rivalry existed between him and a contemporary, James Weston, an author who brought out two or three editions of a very elaborate, complicated, and impractical system. This rivalry finally resulted in a public contest of shorthand skill, of which Byrom was the victor. Byrom's system was not published until four years after his death. He always exacted a pledge from his students that they would not divulge the principles of his system. As he depended upon teaching it for his livelihood, he adopted this means to safeguard his inventions.

Other publications followed Byrom in rapid succession. Among these should be mentioned Joseph Gurney, 1773; Graves and Ashton, 1775; Mavor, 1778; Blanchard, 1779; Hodgson, 1780. Samuel Taylor was the next author to appear upon the shorthand horizon. His work, entitled *An Essay Intended to Establish a Standard for a Universal System of Stenography*, made its appearance in 1786. The following year Simon George Bordley published the first script shorthand. We thus find ourselves at the dawn of a new era, the beginning of the universal use of shorthand and the birth of a new type. The Taylor system rapidly found its way to the Continent and was adapted to practically all of the European languages. Nearly 200 different books have appeared on this system in English, representing the work of more than 100 writers. Among the new features to be found in the Taylor system was the provision for separate characters for the vowels O and U. He represented A by a dot at the beginning of a stroke, E by a dot in the middle, I by a dot at the end, O by a dash at the beginning of the stroke, U by a dash in the middle of the stroke. He divided the circle into eight characters to represent eight different consonants, and then used compound strokes for the other consonants. He advocated writing "according to sound" for the consonants, but his system was not entirely phonetic because he did not have a character to represent each of the vowel sounds as they are usually understood. An edition of the Taylor system was published in Boston in 1809 by S. G. Snelling.

The next landmark in the development of the art is the invention of Isaac Pitman of Bath, England, in 1837. From the time of Taylor to that of Pitman nearly 200 systems came into existence. Most of them were improvements upon either Taylor or Mason, and few survived the first edition. Isaac Pitman (q.v.) was a student of the Taylor system, beginning the practice of the art at the age of 16. At 24 he gave to the world his *Stenographic Sound Hand* and in 1840 published his *System of Phonog-*

*raphy*. He brought to his work in this field a mind well trained in the science of phonetics and a consuming desire to benefit his fellowmen by simplifying the art of writing and opening up opportunities for education among the lower

classes. Distinctive features claimed for his new system were: (a) a sign for each sound, including the vowels; (b) light and heavy strokes for the paired sounds; (c) no compound or modified strokes; (d) the joining of

little words together—phrasing. Provision was made in the first edition for the representation of the liquids *l* and *r* by hooks. The halving principle, whereby a stem is shortened to represent the letters *t* or *d*, was introduced in the second edition (1840). Intersected words, contractions, and phrases appeared in the fifth edition (1842). The representation of the letter *n* by means of a hook was given in the sixth edition (1844). Final hooks for *f*, *v*, and the termination *shun* were published in the tenth edition of 1857. Other modifications and improvements have been made almost yearly up to and including the Centenary edition of 1913.

The fundamental features of all the Pitmanic systems are quite similar, so that a description of one will answer for all. The consonant alphabet is derived from the circumference and radii of the circle. There are 26 characters representing 24 sounds. Duplicate characters are provided for *r* and *h*. Twelve vowel sounds are represented by dots and dashes. Long vowels are represented by heavy characters, short vowels by light characters. The consonants are written first, and then the vowel is placed in its proper position. Vowels placed to the left of a vertical stroke, or above a horizontal stroke, are read before; when placed to the right of a vertical stroke or below a horizontal stroke, they are read after the stem. The diphthongs are represented by acute angles pointed in various directions. The sound of *u* is represented by a semicircle opening downward. Silent letters are omitted. The letter *s* occurs more frequently at the beginning or end of syllables than any other consonant. To represent this sound the circle, the most distinctive auxiliary material, is used as a duplicate form of this letter. The circle is lengthened slightly to indicate a following *t*. It is made twice its usual size to represent *sw* at the beginning of words and *ses* at the end of syllables. A small hook placed at the beginning of a stroke represents *l* or *r*, depending upon which side it is written. A small hook at the end of a stroke represents *n*, *f*, or *v*, depending upon the side it is written. A large final hook represents the termination *shun*. By making a stroke half its usual length the sound of either *t* or *d* is indicated. Doubling the length of a stroke indicates the sound of *ter*, *der*, *ther*. The most suggestive sound in a word is used to represent that word if it is one that occurs very frequently, such as the articles *a*, *an*, and *the* and the prepositions *of* and *on*. Words having these brief signs are called grammalogues. When the word is long two strokes are employed. Such words are called contractions. Where two or more words are joined in one outline, they are called phrases. Any system of shorthand seems at first to be vague and complicated, but with a little study the beauties of the art become apparent.

Graphic, Script, or Cursive Shorthand. In 1787 there appeared a system of shorthand based upon principles hitherto overlooked. The author of this system was Simon George Bordley. He wrote under the pen name of Cadmus Britannicus. The characters used were conformable to the written letters of ordinary longhand. In 1802 Richard Roe published a system of a similar nature. This was followed in 1814 by another cursive system, the author being James Adams. Thomas Oxley published a system in 1816. By some students of the subject it has been thought that the German script hand of

Gabelsberger, which made its appearance first in 1824, was based in part upon the Oxley system. Other graphic systems produced in rapid succession were Henry Upington, 1825; J. and J. Aitchison, 1832; Daniel Cadman, 1835; J. Clarke, 1840; Fayet, Paris, 1832; Dujardin, Paris, 1834; Gabelsberger, Munich, 1834; Richter, adaptation of Gabelsberger to English, 1886; Stolze, 1841; Arends, 1850; John Thompson, 1803; Rundell, 1883; Thomas Anderson, 1882; Mares, 1885; Davies, 1887; Malone, 1886; Kingsford, 1888; Gregg, 1888; Callendar, 1889.

**Gregg Shorthand.** The system of shorthand invented by John Robert Gregg and which now bears his name was first published in Liverpool, England, in 1888 under the title *Light Line Phonography, the Phonetic Hand Writing*. The system was introduced in America in 1893 in the city of Boston by the author. Later Mr. Gregg removed to Chicago, where he established a school and began the publication of a series of textbooks and a magazine. The system is radically different from the geometric style, the characters being based upon the movement used in longhand writing. Its characteristic features are: (a) the absence of shading or thickening principle; (b) a uniform motion of the hand, resulting from the fact that the characters are similar to the strokes used in longhand; (c) the insertion of the vowels without the necessity of lifting the pen, or writing the outline above, on, or through the line to indicate them; (d) uniform lineality by reason of the nature of the alphabetic strokes; (e) facility of execution by reason of the predominance of curved strokes; (f) individuality of form, there being few outlines which are not distinctive; (g) the systematic blending of frequent consonant combination to eliminate obtuse angles. The alphabet of the system and some of the principles of abbreviation are illustrated below.

TABLE III GREGG SHORTHAND  
THE CONSONANTS

Written from left to right:

K G B L N M T D TH  
— — — — — — — — or —

Written downward:

P B F V CH J SH S H  
( ( ( / / / or , (a dot)

BLENDEN CONSONANTS

By eliminating the obtuse or blunt angle the following blends are obtained:

Ten. Den	Def. Dev. Tive
Tem. Dem	Jent. Pend
Ent. End	Men. Mem
Emt. Emd	Ted. Ded
up	Ses
	or 2

THE VOWELS

Short vowels:

ä o as in jam	mad
ī " " him	ill
ö " " hot	top
ü " " duck	ouff

Medium and long vowels:

The medium and long sounds of each group (ā, ā; ē, ē; ō, ō) are distinguished, when necessary, by a dot for the medium and an oblique dash for the long sound; thus:

— calm    — came    — met    — meet  
— wrought    — wrote    — took    — doom

THE DIPHTHONGS

Diphthongs are expressed by joining the signs for the vowels of which they are composed:

ū    ow    oi    io

WORD SIGNS AND PHRASES

Brief forms called word signs are provided for frequently occurring words. Phrases are formed by joining word forms.

— it    — you    — it will  
— will    — can    — I am  
— I    — the    — you can  
— am    — that    — that the

SPECIMEN

KEY

I do believe that within a century correspondence will be carried on in some form of shorthand. I regard this as a certainty, because I believe that the stress and the pressure of life will make it absolutely necessary, whether we wish it or not.—Lord Rosebery.

**America.** Early in the nineteenth century adaptations of Taylor were published in the United States. Phineas Bailey published his system in 1819 and Keyes A. Bailey in 1831. It was not until 1843, however, that any active effort was made to spread a knowledge of the art. During that year Stephen Pearl Andrews visited London as a participant in the World's Antislavery Convention. While there he came into possession of some books and pamphlets describing the Isaac Pitman system. These he studied on the return voyage and resolved at once to become a propagandist of the new style of writing. He soon enlisted the services of Augustus F. Boyle and Oliver Dyer. In 1844 Andrews and Boyle published their first textbook of the system. Within five years from this time the phonographic art was being taught in a large number of high schools of the United States. They continued their efforts along this line until 1852, when Benn Pitman, a brother of Isaac Pitman, came to America and took charge of the work. In a few years adaptations of the Isaac Pitman system were published by American authors. Among these were Andrew J. Graham, James E. Munson, Elias Longley, Epinetus Webster, James C. Booth, Isaac S. Dement, George W. Davis, Alfred Day, and others. Benn Pitman began a series of textbooks of his own in 1855. Since the year 1887 these publications have been edited and issued

by Jerome B. Howard and Benn Pitman in collaboration.

An original graphic system, the Eclectic, was produced in 1877 by J. George Cross. It gained wide popularity for a time, but is not extensively used at the present time. In the same year H. M. Pernin of Detroit published an adaptation of the French system, Duployé. It is used largely in parochial schools. A connective vowel system by C. E. McKee (1889) and one by W. E. Scovill of Canada (1855) were other important contributions to the increasing literature of shorthand.

Julius Ensign Rockwell, the noted American bibliographer, has listed the names and dates of 1070 works on shorthand in the English language. At least one-third of these have appeared in America. In addition to the textbooks on the subject a number of magazines have been published, their careers running from a few issues to 40 years. Each of the leading systems has its own official organ.

**Machine Shorthand.** Beginning in the last quarter of the nineteenth century a number of machines, designed for the purpose of writing as fast as the demands of dictation would require, have appeared upon the market. The more successful of these have been the Anderson, the Stenograph, the Stenotype, and the National. These machines are so constructed

that all of the keys may be depressed simultaneously. A code is developed, so that an entire word may be written at one stroke. After the abbreviations are memorized the operator

is enabled to write quite as fast as one can with shorthand. Much time and money are being spent in an effort to develop this department of rapid writing.

**Germany.** F. X. Gabelsberger, known as the father of shorthand in Germany, was born in Munich, Feb. 9, 1789, and died Jan. 4, 1849. He submitted his method to the Minister of Public Instruction in 1824 and five years later received an order to teach his system. He published his complete work in 1834 and an improved edition in 1843. For this he received high praise from the Academy of Science. His system was based upon the ordinary longhand. Soft sounds are represented by small and round signs, while hard sounds are represented by signs much larger. The vowels are represented symbolically by means of signs on a system of lines resembling those in written music, i.e., by a position higher or lower than the one preceding or following. Consonant strokes are written in three different sizes. To obtain rapidity in writing the vowels may be largely omitted.

This system has been successfully adapted to almost all the languages of Europe. Out of the Gabelsberger system have sprung several valuable offshoots which are used throughout Russia, Hungary, Austria, Holland, Norway, Sweden, and other countries.

**France.** In 1593 Lambert Thomas Schenckel published a system of brief writing based upon a similar idea to that of Timothy Bright, viz., word representation as distinguished from either syllabic or alphabetic representation. The first alphabetic system dates from 1651, Abbé J. Cosnard being the author. But three copies of this work are known to be in existence, one in the New York public library, the others in the National Library in Paris.

In 1790 M. Bertin published an adaptation of the English system of Taylor, and this was the beginning of practical shorthand in France. Improvements on this system were made by Prevost (1826) and Aimé Paris (1822). These two authors were the leaders of two distinct schools of writing. The system of Prevost was improved by Delaunay (1878), while that of Paris was modified by Guenin (1884) and Duployé (1867). The system of Prevost and Delaunay is employed chiefly by professional reporters, while that of Duployé is more popular among amanuenses and those who pursue the study for personal use. The Duployan system was adapted to the English language by J. M. Sloan (1882) and A. J. Pernin (1877). The latter edition was brought out in America.

Shorthand is used in every part of the globe where business is transacted. In England, since 1588, more than 300 separate systems have appeared. There are also four Welsh systems. In France 145 authors have made contributions. More than 200 systems have been published in Germany, 70 in Italy, 36 in Spain, 9 in Portugal, 11 in Holland, 3 in Denmark, and a similar number in Turkey, Bulgaria, Finland, and Greece. The art was introduced to continental Europe the latter part of the eighteenth century. In so limited a field it is almost beyond the range of human possibility that an author should originate every character and principle. To a certain extent, since the times of John Willis in 1602, each has builded upon the foundation laid by his predecessors. This does not detract in the least from the merit of the contribution. From the first each author claimed his product

to exemplify the perfected stage in the development of the art, but each succeeding year witnesses new improvements upon old systems and the appearance of new styles sufficiently original to warrant the use of the term "system."

**Bibliography.** Large collections of books pertaining to shorthand are to be found in various libraries of the world. Original manuscripts written in Tironian notes may be seen in the libraries of Turin, Milan, Naples, Vienna, and Rome. The libraries of Germany and France also contain fine collections of these manuscripts. Of the modern publications, dating from 1588, copies of practically every book and magazine may be found in the library of the Royal Stenographic Institut at Dresden, the Bodleian Library at Oxford, and the British Museum. Other libraries worthy of mention are the ones at Birmingham and Manchester, England; the National Library of Paris; the Beale Library of New York City; the library of the Phonographic Institute, Cincinnati; the Congressional Library, Washington. Consult: J. H. Lewis, *Historical Account of the Rise and Progress of Shorthand* (London, 1816); M. Levy, *The History of Shorthand Writing* (ib., 1862); J. W. Zeibig, *Geschichte und Literatur der Geschwindtschreibekunst* (Dresden, 1878); Thomas Anderson, *History of Shorthand with a Review of its Present Condition and Prospects in Europe and America* (London, 1882); J. E. Rockwell, *Teaching, Practice, and Literature of Shorthand* (Washington, 1885); Isaac Pitman, *History of Shorthand* (London, 1891); J. E. Rockwell, *Shorthand Instruction and Practice* (Washington, 1893); M. Guenin, *Histoire de la stenographie* (Paris, 1908); M. Navarre, *Histoire générale de la stenographie* (ib., 1909); also: *Transactions of the International Shorthand Congress* (London, 1887); *Proceedings of the International Shorthand Congress* (Chicago, 1893); Willis-Byrom Club, *Bulletin* (Washington, 1915 et seq.); *The Book of the Silver Jubilee of Gregg Shorthand* (Chicago, 1913).

**SHORTHORN.** See CATTLE, and Plate of CATTLE, DAIRY.

**SHORTHOUSE, JOSEPH HENRY** (1834-1903). An English novelist, born at Birmingham. He was educated at private schools and by business was a chemical manufacturer in his native city. In 1881 he became widely known for his romance, *John Inglesant* (previously issued for private circulation, new ed., New York, 1903), which at once took a high rank among English historical novels for the beauty of its style and the vivid fidelity of its historical portraiture. It is a sort of Anglo-Catholic tract. It was succeeded by *The Little Schoolmaster Mark: A Spiritual Romance* (1883); *Sir Percival* (1886); *A Teacher of the Violin and Other Tales* (1888); *The Countess Eve* (1888); *Blanche, Lady Falaize* (1891). The *Life and Letters of Shorthouse* appeared in London in 1905. Consult P. E. More, in *Shelburne Essays* (3d series, New York, 1905).

**SHORTSIGHTEDNESS.** See MYOPIA; SIGHT, DEFECTS OF.

**SHORTT, ADAM** (1859- ). A Canadian political scientist. He was born at Kilworth, Ontario, and was educated at Queen's University, Kingston, where he graduated in 1883, and also at Glasgow and Edinburgh universities. At Queen's he was a member of the faculty from 1885 to 1908, being professor of political science from 1892. In 1908 he was appointed

Dominion Civil Service Commissioner. In 1911 he was created C.M.G. He published: *Imperial Preferential Trade from a Canadian Point of View* (1904); *Documents Relating to the Constitutional History of Canada, 1759-61* (1907), with A. G. Doughty; *Lord Sydenham* (1908), in the "Makers of Canada Series." Shortt and A. G. Doughty were general editors of *Canada and its Provinces* (22 vols., 1914).

**SHOSHENK.** See SHISHAK.

**SHOSHONE**, shō-shō'nē (probably from *Shishinowits*, snake, the name given to the related Comanche by the Cheyenne). The tribe, calling themselves simply Nūmū (people), from which the Shoshonean stock (q.v.) takes its name, formerly holding the mountain country of western Wyoming and Montana, central and southern Idaho, a small strip of Utah, northeastern Nevada, and eastern Oregon. The earliest notice is due to Lewis and Clark, who encountered a band in southwestern Montana and later visited a village on the Lemhi River. In common with their neighbors, the Banak and Piute, the Shoshone have frequently been known under the collective term of Snake Indians, a name which seems to have its origin in a misapprehension of the tribal sign in the sign language—a waving outward motion of the index finger. Although commonly interpreted as snake, this sign is said by good authorities to have been originally intended to indicate a peculiar style of brush-woven lodge formerly used by the Shoshone. They were divided into several bands with little cohesion. Culturally they represent the Plateau type, the simplest in America, with a superimposed stratum derived from the Plains area. The eastern bands had horses and sometimes hunted the buffalo, but usually were kept close to the mountains by their fear of the more warlike Plains tribes. The more western bands depended chiefly upon camas and other roots, seeds, nuts, rabbits, fish, and other small game. None of them were agricultural. Their dwellings varied from the skin tepee in the east, doubtless adopted in recent times from the Plains Indians, as a substitute for the older grass lodge, to the merest brush windbreak in the west. There was no head and very little show of authority of any kind. Physically they are shorter and rather more plump than the people of the Plains tribes. In 1909 they numbered about 3500, viz., Banak and Shoshone or Fort Hall Agency, Idaho, 1766, including 474 transferred from Lemhi Agency, Idaho; Western Shoshone Agency, Nevada, 243, besides about 750 unattached; Shoshone Agency, Wyoming, 816. Consult R. H. Lowie, *The Northern Shoshone* (New York, 1909).

**SHOSHONE** (shō-shō'nē) **FALLS.** A magnificent cataract of the Snake River (q.v.) in southern Idaho, exceeded in grandeur, in the United States, only by the Niagara and the falls in the Yosemite valley (Map: Idaho, D 7). After flowing through a cañon 800 feet deep the river, here nearly 1000 feet wide, first falls 30 feet through several rocky channels and then in a single sheet makes a plunge of 190 feet into a dark-green lake at the bottom of a gorge over 1000 feet deep. The falls are formed by a ridge of hard rock uncovered by the wearing away of superimposed lava beds. The height exceeds Niagara, and during the spring floods the volume of the cataract is not far short of that of the more celebrated

falls. Consult Roberts, *Shoshone and Other Western Wonders* (New York, 1888).

**SHOSHONEAN STOCK.** An important group of cognate tribes originally holding most of the territory from the central Rocky Mountain region, across the interior basin, to the Sierras and extending on the southeast into the Texas prairies and on the southwest across south California to the Pacific. At one time also they held the south bank of the Columbia, but were driven off by the invasion of Shahap-tian tribes within the past hundred years. Their principal tribes are the Banak, Comanche, Mono, Hopi, Kawia, Mission Indians (chiefly), Piute, Paviotso, Chemehuevi, Ute, Pahvant, Panamint, Serrano, and Shoshone proper. Their general line of migration seems to have been southward between the two great mountain chains, the Comanche alone becoming a prairie tribe by separation from the Shoshone, while other bands of Piute connection penetrated southern California by displacing the weaker natives. Only the Hopi were sedentary, the rest being roving and subsisting upon hunting, fishing, or gathering roots and seeds. The Ute and Banak were noted for their fighting temper, but the others as a whole were rather below the warlike standard of the eastern tribes. With the exception of the Hopi, whose culture was that of the Pueblos generally, the Shoshonean tribes were characterized by a democratic looseness of organization and lack of elaborate ceremonial. They numbered in 1915 altogether 16,842. It is now held by some competent linguistic authorities that the Shoshonean, Tañaoan (including Isleta, Jemez, and other Pueblos), Piman, and Nahuatl are all but branches of one great linguistic stock, which Brinton designates as the Uto-Aztecan. Consult A. L. Kroeber, "Shoshonean Dialects of California," in *University of California, Publications in American Archaeology and Ethnology*, vol. iv (Berkeley, 1907), and Edward Sapir, "Southern Paiute and Nahuatl," in *Journal de la Société des Américanistes de Paris*, vol. x (N. S., Paris, 1913).

**SHOSTAKOVSKY**, shōs'tá-kōf'skī, PETER ADAMOVITCH (1853- ). A Russian pianist. After his début at 15 he studied at the St. Petersburg Conservatory and in Germany under Kullak and Liszt (qq.v.). He held a professorship at the Moscow Conservatory, but soon resigned, owing to differences with Nicholas Rubinstein, founding (1878) a music school of his own. In 1883 this became the nucleus of the Moscow Philharmonic Musico-Dramatic School, recognized by the government as a conservatory in 1886. For many years Shostakovsky was its director and also conducted the Philharmonic concerts. From 1889 to 1894 he was director of Italian opera at Moscow. After 1898 he lived outside Russia.

**SHOT.** See AMMUNITION; PROJECTILES.

**SHOT BORER.** See PIN BORER.

**SHOTGUN.** A hand firearm, commonly equipped with one or two smoothbore barrels, from which are fired charges of small shot, as distinguished from the rifle, which fires a single bullet that closely fits a grooved bore. (See RIFLE, HUNTING; SMALL ARMS.) The shotgun is used chiefly in the hunting of small game, especially birds, but with large shot it is sometimes used in the pursuit of big game.

Shotguns light enough to be used as hunting weapons were made as early as the middle of

the seventeenth century. The first of these weapons had no rib between the barrels and was fired by a wheel lock. The rib and a flint-lock firing device were added early in the eighteenth century, and this form of the arm was being generally used in the first quarter of the nineteenth century. The practical application of the principle of detonation as a firing medium was due, curiously enough, to the inventive genius of a Scottish clergyman, Alexander John Forsyth (1769-1843), who perfected a detonating appliance for a fowling piece in 1805 and patented it in 1807.

The first practical double-barreled breech-loading shotgun was made in 1836 by a French gunsmith, Casimir Lefauchaux (1802-52). Though this was a crude weapon in most respects, it is a remarkable fact that its inventor utilized, for the first time, the principle of having the barrels tip downward from a hinge near the breech, a form which has never been improved upon and is used to-day by practically all shotgun makers. Lefauchaux also invented a pin-fire paper cartridge which, at the instant of its discharge, expanded at the base, thereby sealing the breech joint and preventing the escape therefrom of gases generated by the combustion of the powder, a dangerous imperfection which had hitherto been inherent in all breech-loading mechanisms.

In 1847 Houiller, also a French gunsmith, patented a gas-tight, central-fire cartridge case, from which the present shotgun cartridge is directly descended and which made possible the production 10 years later by G. H. Daw, an English gunsmith, of a practical and efficient breech-loading shotgun. Of the futile attempts to improve upon Lefauchaux's breech action, the principal ones were the Bastin-Lepage action, in which the barrels, actuated by a lever, were moved forward and backward on the fore part of the stock; the turnover breech, in which the barrels revolved on a pinion to the right far enough to admit of the cartridges being inserted; and the side motion (invented by W. Jeffries about 1862), in which the barrels were turned, i.e., swung, on a pivot by a lever pivoted vertically under the breech action. This principle, minus the lever, was adopted by the American manufacturers of the Fox gun, but was soon seen to be defective and was abandoned. Of improvements in the firing mechanism up to about this time, the most important was the rebounding lock, devised by W. W. Greener, the English gunsmith, in 1864. By this device the hammers, upon striking the firing pins, were automatically thrown back to half cock, thus permitting the opening of the breech and giving considerable protection against accidental discharge. The top-lever action for locking and unlocking the barrels, which is now almost exclusively used, was introduced in successful form about 1860.

The next radical improvement in the efficiency of the shotgun was effected by chokeboring the barrels, i.e., boring them so that their diameters are suddenly reduced within a few inches of the muzzle. (The term "cylinder bore" is also often applied to a shotgun barrel, but is generally a misnomer, for practically all barrels taper slightly from breech to muzzle.) The degree of this constriction is spoken of in such terms as full choke, half choke, and quarter choke. Manufacturers and gunsmiths are apt to be secretive as to the precise lines and degrees

of this constriction which they use, but in a general way it may be said that for full choke it varies from about 20 to about 40 thousandths of an inch, according to the gauge of the gun. The practical effect of this expedient is suddenly and violently to throw the charge together as it leaves the muzzle of the gun, with the result that it flies in a smaller cloud, and with greatly increased range and penetrative power, as compared with a corresponding charge fired from a gun which is cylinder-bored or practically so.

It appears that the principle of chokeboring was understood and practiced, roughly at least, as early as 1781 in France, and an article published in the *St. James's Gazette* in 1789 indicates that attempts were then being made to put the principle into practice in England. Its actual practical application has been claimed for an American, Jeremiah Smith, a gunsmith of Southfield, R. I., who is said to have successfully applied the principle to a shotgun in 1827; but this does not seem to have been clearly proved. On the other hand W. W. Greener, the celebrated English gunsmith, though not claiming to have discovered the principle, declares flatly (speaking of himself in the third person) that "the form of choke he produced, which has now been generally accepted, and the method of producing it, are of his own invention" (p. 251 of Greener's book cited below).

The term "hammerless" as applied to modern shotguns means simply that the strikers which explode the cartridge are entirely concealed within the lock frame. This principle was understood and applied to shotguns as early as 1831, but it was then employed only as a means of exploding a certain kind of pin-fire cartridge and disappeared with the perfection of the gas-tight central-fire cartridge case, which required the outside hammer mechanism. In 1862 Daw (above mentioned) produced a hammerless weapon, but it was a clumsy arm in comparison with his own hammer gun and therefore could not compete with it. The first really successful gun of this type was made by T. Murcott in 1871, and at about this time Needham, an English gunsmith, was the first to utilize the weight of the barrels, turning on the hinge pin, to cock the piece, the principle upon which all hammerless locks are now made. The opposition in turn to the detonating principle, to the breech-loading gun, and to the central-fire cartridge was expressed once more, and with even greater vehemence, against the hammerless gun, which was at first denounced as a veritable invention of the devil; but as before the outcry subsided within a few years, and no sensible person now questions the immense superiority of the hammerless over the hammer gun. The latest substantial improvement in shotgun lock mechanism is the single trigger device, by means of which either barrel may be fired from one trigger, the other being altogether dispensed with.

There remain to be mentioned three types of single-barreled magazine shotguns, two operated by hand and the other self-loading. One of the hand-operated guns is equipped with a lever action, like that of the ordinary repeating rifle, and the other has the pump or trombone action. Both of these actions are described under RIFLE, HUNTING. With these guns from five to ten shots can be fired very rapidly. The mechanism of both types of this gun is fairly reliable, and they are much used in trap shooting, many

experts asserting that it is possible to shoot more accurately with them, because they are single-barreled, than with any double-barreled gun; but both have the inherent defect of a changing balance as the cartridges are withdrawn from the magazine under the barrel. The self-loader, or automatic, utilizes the recoil from the explosion of the cartridge to reload and cock the piece, which may be fired much more rapidly than any hand-operated weapon. For moral rather than for mechanical reasons many conservative sportsmen are strongly opposed to weapons of this type and even to pump guns, on the ground that because of the rapidity with which they may be fired they may be highly destructive even in the hands of a tyro, while they can be and have been used by professional market hunters with such deadly effect as to threaten the extermination of game birds, especially the waterfowl. In the United States this opposition has made itself felt by the prohibition of the use of such guns in Pennsylvania and New Jersey (where even pump guns are barred), while the use of the automatic is forbidden in all of the provinces of Canada excepting the Yukon.

A rather remarkable modern tendency is towards the substitution of small, even very small, bore guns for those of larger gauge. Under this influence the 8, 10, and 12 bore weapons have been giving way to those of 16, 20, and even 28 gauge. Although it seems doubtful whether this movement is entirely justified, it is probably true that with smokeless powder a 16 or even a 20 will do most of the work of a 10 or a 12 and that the days of the very large bore gun are numbered.

Consult: Charles Askins, *The American Shotgun* (New York, 1910); Horace Kephart, *Sporting Firearms* (ib., 1912); for a history of the evolution of the shotgun, W. W. Greener, *The Gun and its Development* (ib., 1907).

**SHOTWELL**, JAMES THOMSON (1874- ). An American historical scholar, born at Strathroy, Ontario, Canada. He graduated from Toronto University in 1898 and received his Ph.D. in 1903 from Columbia, where after 1907 he was professor of history. In 1904-05 he was joint assistant editor of the *Encyclopædia Britannica* in London, and in 1906, while on the staff of the London *Times*, he organized a reference department for the more adequate handling of foreign news, from which resulted the new indexes of the *Times*. He became editor of the *Records of Civilization*, a series of 20 volumes of studies and sources intended to cover the whole field of history, and he published *The Religious Revolution of To-Day* (1914).

**SHOULDER BLADE.** See **SCAPULA**.

**SHOULDER JOINT** (AS. *sculdor*, OHG. *scultirra*, Ger. *Schulter*; of unknown etymology). A ball-and-socket joint formed at the junction of the humerus and scapula. The large globular head of the humerus is received into the shallow glenoid cavity of the scapula, by which arrangement extreme freedom of motion is obtained, while the apparent insecurity of the joint is prevented by the strong ligaments and tendons which surround it, and also by the arched vault above formed by the undersurface of the acromion and coracoid processes. (See **SCAPULA**.) As in movable joints generally, the articular surfaces are covered with cartilage, and a synovial membrane lines the interior of

the joint. The most important connecting medium between the two bones is the capsular ligament, which embraces the margin of the glenoid cavity above and is prolonged upon the tuberosities of the humerus below.

The morbid affections of the shoulder joint may be divided into (1) those arising from disease and (2) those dependent upon accident. The shoulder joint is not as liable to disease as the other articulations; it may, however, become the seat of a synovial inflammation, active, subacute, or chronic, and less often of tuberculous, syphilitic, or rheumatic disease. There may be fracture (1) of the acromion process, (2) of the coracoid process, (3) of the neck of the scapula, or (4) of the superior extremity of the humerus; or two or more of these accidents may be associated. Again, the head of the humerus may be dislocated from the glenoid cavity in a direction above, below, in front, or behind this cavity. The anterior variety is most frequent.

**SHOULDER STRAPS.** See **MILITARY INSIGNIA**.

**SHOVEL**, STEAM. See **STEAM SHOVEL**.

**SHOVELBOARD.** See **SHUFFLEBOARD**.

**SHOVELER** (so called from the shape of its bill). A cosmopolitan fresh-water duck of the genus *Spatula*, remarkable for the expansion of the end of the mandibles, the lamellæ of which are long and very delicate. The legs are placed near the centre of the body, so that these birds walk much more easily than many of the ducks. The common shoveler (*Spatula clypeata*) is smaller than the mallard, but rather larger than the widgeon. The male has the head and neck fuscous, glossed with green, the back fuscous, upper and under tail coverts dark green, lower neck and breast white, and the belly chestnut. The female is much duller. See **PLATE OF DUCKS**, **NORTH AMERICAN WILD**.

**SHOV'ELL**, SIR CLOWDISLEY (1650-1707). An English admiral, born in Cocksthorpe, Norfolk. He entered the navy in 1664 and served against the Dutch and against the Barbary pirates. In 1689 he commanded the *Edgar* in the battle of Bantry Bay, was soon after knighted, and was put in command of a squadron in the Irish Sea. In the following year he was promoted to be rear admiral of the blue. In 1704 he participated with the fleet under Sir George Rooke in the capture of Gibraltar and in the action off Malaga. In the following year he was appointed admiral and joint commander with the Earl of Peterborough of the expedition which captured Barcelona. In 1707 he coöperated with the Duke of Savoy in the attack on Toulon, and, although the town was not taken, Shovell destroyed a great number of French vessels. On the way back to England his flagship was wrecked on one of the Scilly Islands. He was cast ashore in a helpless condition and was murdered. Consult W. L. Clowes, *The Royal Navy: A History* (6 vols., Boston, 1896-1901).

**SHOWBREAD.** See **SHEWBREAD**.

**SHRADY**, GEORGE FREDERICK (1837-1907). An American surgeon and medical journalist. He was born in New York City, where he was educated (M.D., 1858, College of Physicians and Surgeons) and where he opened a practice in 1859. From 1860 to 1863 he was associate editor of the *American Medical Times*, and from 1866 until his death he was editor of the *Medical Record*.

**SHRADY, HENRY MERWIN (1871-1922).** An American sculptor. He was born in New York, graduated at Columbia in 1894, and first studied law, but gave it up for sculpture, in which art he was self-taught. In 1901 he won the competition for a \$50,000 equestrian statue of Washington for Brooklyn, unveiled in 1906, and in 1902 the competition for the Grant Memorial in Washington, D. C. He received also a commission from the Holland Society of New York for an equestrian statue of William the Silent. His work is monumental and spirited in conception and broadly and simply handled.

**SHRAPNEL.** A form of projectile extensively used in field guns and to a less extent in naval guns, invented by Col. Henry Shrapnel of the British army. It consists of a shell containing a number of balls, a bursting charge, usually of black powder, and a combination time and percussion fuse. (See FUSE.) The bursting charge may be located either in the front or in the rear of the shell, whose walls are thinner than in the case of ordinary shell. The bursting charges may also be contained in a central tube. The balls may be placed either in metal or wooden frames or plates or in a matrix of resin. Shrapnel is designed for use against troops in open country or for clearing covered spaces, destructive effect over a considerable area rather than penetrative power being desired. In naval warfare shrapnel is used against attack by torpedo boats or small boats.

Shrapnel, for field guns filled and fused, weighs from 12½ to 18 pounds, these being the weights for the British horse artillery gun and the British light field gun respectively. The thin steel case, whose length is approximately three times its diameter, is filled with lead balls (from 238 to 350 for the light field gun), each about one-half inch in diameter and weighing from 140 to 180 grains (36 to 50 to one pound). When the bursting charge of a few ounces of powder is ignited by the action of the fuse it expels the balls, increasing their velocity over that of the projectile at the instant of burst by approximately 300 foot seconds. The fuses, which are described and illustrated under FUSE (q.v.), are mechanically set in terms of the range, with certain corrections for atmospheric and other local conditions,

Diagram showing cone of dispersion of bursting shrapnel. Dotted lines show section of cone at the ground in the form of an irregular oval. The dimensions of this area will vary with the angle of fall, the height of burst, and the relation between the velocities of translation and rotation at the moment of burst. (After Lissak.)

and the distance at which the projectile will burst in front of the target is so regulated before firing. The effect is to transform the single projectile into a flying mine, which discharges upward of 300 bullets, any one of which is capable of putting a man hors de combat anywhere within 400 yards of the point of burst, according to American and German standards,

which estimate a striking energy of 58 foot pounds as ample. French estimates in this respect are considerably more conservative. This projectile is particularly adapted for living targets (men and horses), and when prop-

TYPICAL SHRAPNEL, 1915. (From *Machinery*, New York.)

A, American 3-inch; B, Russian 3-inch; C, German 77-millimeter (3.03"); D, French 75-millimeter (2.95"); E, British 18-pounder (3.29").

erly adjusted can make the portion of the field untenable as long as the ammunition supply holds out. The area covered by a single well-adjusted shrapnel at a range of 3000 yards is about 250 by 20 yards.

The manufacture of shrapnel during the Great War became an important industry not only among the belligerent countries of Europe, but also was taken up by a number of manufacturers in the Dominion of Canada and in the United States. The two most important methods for the manufacture of the cases involved either the use of treated rough-turned bars which were machined in turret lathes, or employing forgings machined to the approximate dimensions of the case and then heat-treated. In the first case, while more expensive material was required to enable the lathes to work up the cases satisfactorily, yet when they left the machine they required no further care. In the second method individual forgings were taken and machined to the proper dimensions, though this of course required careful treating. Still another method was to use rough-rolled bars about ½ inch greater in diameter than the finished case, and from them turn the cases, treating them before finishing, just as in the case of forgings. Special machinery was developed for making shrapnel in many large plants, and the vast number expended in constant artillery fire necessitated the operation of huge plants night and day. The technical methods of manufacture received full attention in the engineering press during the war, and the *American Machinist* (New York, weekly) and *Machinery* (ib., monthly) are two of the engineering journals which may be consulted

with profit. See PROJECTILES and the bibliography there given.

**SHRAPNEL**, HENRY (1761-1842). An English soldier and inventor, born at Bradford-on-Avon, Wiltshire. In 1784 he began to study hollow projectiles. He was stationed at Gibraltar in 1787-91. In 1803 his shot case or shell was recommended for adoption into the service and in the following year was first employed at Surinam. The results of its use in the Peninsula War were highly satisfactory to Wellington. Shrapnel also improved the construction of howitzers and mortars and invented the brass tangent slide. In 1837 he was promoted to be lieutenant general. See PROJECTILES; SHRAPNEL.

**SHREVE**, HENRY MILLER (1785-1854). An American inventor and steamboat builder, born in Burlington Co., N. J. He was reared in western Pennsylvania and became a river boatman early interested in steam navigation on the Ohio and Mississippi. In 1814 he participated in the battle of New Orleans. In 1815, in the *Enterprise*, he made the first steamboat trip from New Orleans to Louisville. His river steamboat *Washington* had many points of improvement over the Fulton model. The success of the *Washington* was followed by lawsuits brought by Fulton, who claimed exclusive right to steam river navigation, but the cases were decided in Shreve's favor. From 1826 to 1841 he was employed by the government as superintendent of improvements on Western rivers and opened the Red River to navigation. He invented many improvements in steamboat machinery and construction.

**SHREVEPORT**. A city and the parish seat of Caddo Parish, La., 170 miles east of Dallas, Tex., on the Red River, at the head of navigation, and on the Texas and Pacific, the St. Louis Southwestern, the Kansas City Southern, the Houston and Shreveport, and other railroads (Map: Louisiana, B 2). Among the noteworthy features of the city are the Charity Hospital, Genevieve Orphanage, Golf and Country club, State Fair Grounds, St. John's College, Centenary College, St. Vincent's Convent, St. Mary's Convent, sanatoriums, Youree Hotel, Commercial National Bank Building, the United States post office, city hall, the courthouse, and seven public-school buildings. Shreveport is in a rich cotton and stock-raising region and is of considerable commercial importance. It carries on a large wholesale trade, especially in groceries, dry goods, lumber, and hardware. This trade in 1914 amounted to \$70,000,000. In addition to several establishments connected with cotton—cotton factory, large compressors, and warehouses—there are molasses works, foundries and machine shops, glass and bottle factories, lumber mills, etc. Large natural-gas and oil fields 20 miles north of the city were first developed in 1906 and in 1914 yielded a product valued at almost \$15,000,000. The government is vested in a mayor and four commissioners. Pop., 1900, 16,013; 1910, 28,015; 1915 (U. S. est.), 34,068; 1920, 43,874.

**SHREW** (AS. *scrēawa*, shrew; connected with OHG. *scrōtan*, Ger. *schroten*, to cut, gnaw, bruise, AS. *scrēadian*, Eng. *shred*). A small nocturnal quadruped of the family Soricidae, and especially of the genus *Sorex*, which includes the smallest of all mammals. The shrews are often confounded with mice, but belong to an entirely different order, the Insectivora

(q.v.). The head is very long, the snout elongated, attenuated, and capable of being moved about. The eyes are minute, the ears small, the tail long, and both body and tail are covered with fine, short hair of a dark color without distinctive variegations. They abound in dry fields, woods, and gardens, and some species are semiaquatic. They feed chiefly upon insects and worms, especially earthworms, and, as they are able to obtain food at all seasons of the year, they do not hibernate. The northern species are hardy, ranging far towards the Arctic, and abroad during all winter. Most species make no burrows, but grub about among roots of herbage, make runways beneath fallen leaves, and hide in old stumps and beneath rotting logs. They are useful in gardens. The males fight fiercely in spring, often killing one another. They form the prey of weasels, foxes, hawks, owls, shrikes, and many other animals and are frequently caught by household cats, but seldom eaten by them, probably on account of their strong musky odor. Although harmless, this animal has long been regarded with dread and hatred by the peasantry of Europe, who believe it to be poisonous and attribute to it other evils. The numerous American species of shrews fall into three genera, *Sorex*, *Neosorex*, and *Blarina*. The largest is the swamp-haunting water shrew, 6 inches in length, including the tail; it is found from Massachusetts to the Rocky Mountains and northward. Of other American shrews the one most common in the eastern United States is the short-tailed or mole shrew (*Blarina brevicauda*), a blackish, stout-bodied, ravenously little animal, which feeds largely upon flesh of every kind and often kills the young of small birds. It takes its name of mole shrew on account of its unusual habit of frequently forcing its way through the loose topsoil like a mole. Perhaps the best-known American form, however, is the long-tailed shrew mouse (*Sorex personatus*), smaller, lighter in color, and most numerous about marshes and streams. An Italian shrew is the smallest of all known mammals, having a body only 1½ inches in length. It is a member of the genus *Crocidura*, which also includes the largest known shrew, one Oriental species of which is that known in India as the muskrat (q.v.). Consult standard zoologies, especially F. E. Beddard, "Mammalia," in *Cambridge Natural History*, vol. x (London, 1902); also: Merriam and Miller, "American Shrews," in *North American Fauna*, No. 10 (Washington, 1895); E. T. Seton, *Life-Histories of Northern Animals* (New York, 1909); G. S. Miller, *Catalogue of Mammals of Western Europe* (London, 1912); Stone and Cram, *American Animals* (new ed., New York, 1914). See JUMPING SHREW.

**SHREW MOLE**. Any of the American moles of the genera *Scapanus* and *Scalops*. See MOLE.

**SREWSBURY**, shrōz'bēr-i or shrōz'. The capital of Shropshire, England, on the Severn, by which it is nearly surrounded, 42 miles west by north of Birmingham (Map: England, D 4). The town, irregular in plan, contains many ancient timber-built houses of picturesque appearance. St. Mary's Church was founded in the tenth century. There are a market house (1595), the shire hall (rebuilt 1883), and the new market hall (1868). The town has interesting remains of ancient walls, a castle, two monasteries, and a Benedictine abbey.

It has manufactures of agricultural implements and linen thread, iron foundries, glass-staining works, and malting establishments, and a large trade in cattle.

Shrewsbury, called by the Welsh Pengwern, was named by the Anglo-Saxons Scrobbes-Byrig, of which the modern name is a corruption. The town was taken by Llewellyn the Great, Prince of North Wales, in 1215, during the troubles between King John and the barons; and in July, 1403, Henry IV here defeated the insurgent Percy with great slaughter, Henry Hotspur being among the slain. The battle is described in Shakespeare's *Henry IV*. The town was taken by the Parliamentarians in 1645. Pop., 1901, 28,400; 1911, 29,389. Consult: Pidgeon, *Historical Handbook of Shrewsbury* (Shrewsbury, 1857); Phillips, *Shrewsbury during the Civil War* (ib., 1898); Thomas Auden, *Shrewsbury* (New York, 1907).

**SHREWSBURY, EARLS and DUKE OF.** See TALBOT.

**SHREWSBURY SCHOOL.** One of the great public schools, at Shrewsbury, England, founded by King Edward VI in 1551 and opened in 1562. Its scope was largely increased by Queen Elizabeth. Under the vigorous administration of Dr. Samuel Butler (1774-1839) it attained a great reputation as a classical school, which was continued under his successor, Benjamin Hall Kennedy, who modernized this school. Its endowment produces more than £3000 a year. In 1882 it was removed to new buildings erected on a site covering 58 acres. The attendance since removal has increased from 170 to nearly 400. Consult G. W. Fisher, *Annals of Shrewsbury Schools* (London, 1899).

**SHRIKE** (AS. *scric*, Icel. *skrikeja*, shrike, from *skríkja*, to shriek, titter; connected with Gk. *κρίκειν*, *krizein*, to creak). A predatory, insectivorous bird of the family Laniidae, having a short, thick, and compressed bill, the upper mandible curved, hooked at the tip, and furnished with a prominent tooth, the base of the bill beset with hairs, which point forward. About 200 species are known, most of them natives of warm climates.

The typical shrikes or butcher birds are those of the subfamily Laniinae, which are mainly inhabitants of northern countries and closely resemble one another in size (9 to 11 inches in total length), colors (pearl gray and white, set off with black markings on the face, wings, and tail), and in boldness and rapacity. Two species inhabit North America. These birds prey mainly on large insects, especially grasshoppers, in summer, but also on small mammals, birds, young snakes, frogs, and crayfish. Those not eaten at once they impale on thorns, splinters, etc., and in confinement they make use of a nail or cage wires. The German peasants believe nine such victims are regularly accumulated by each bird and call a shrike nine-killer. The practice originated, probably, in an effort to fix their food firmly while tearing it; it is not properly speaking food storage, since often the bodies are not again touched. Large numbers of mice and English sparrows are killed in winter, so that the bird is a public benefactor. The typical European species is the great grey or sentinel shrike (*Lanius excubitor*). The common or great northern shrike of North America (*Lanius borealis*), familiar in the northern United States in winter and breeding northward in a rude nest placed in a

tree, is closely similar; while the loggerhead shrike of the Southern States (*Lanius ludovicianus*) has much the same colors, but is smaller.

The large, bald, and strikingly colored piping crows (q.v.) represent an Australian group called Gymnorhinae. Those of the subfamily Malaconotinae are small, brilliantly dressed, forest-dwelling birds of Africa and India, some of which are notable singers. A third group (Pachycephalinae) includes a series of small tree-dwelling, usually yellow, birds of the Malayan Archipelago and Australia, with the habits of flycatchers. Better known are the East Indian wood shrikes of the subfamily Prionopinae, of which the graceful and familiar Australian magpie lark and the queer helmet bird of Madagascar are also members.

Consult: Alfred Newton, *Dictionary of Birds* (New York, 1896); A. H. Evans, "Birds," in *Cambridge Natural History*, vol. ix (ib., 1900); and the authorities therein cited.

**SHRIMP** (assibilated form of *scrimp*, small; connected with MHG. *schrumpfen*, Ger. *schrumpfen*, AS. *scrimman*, to shrink, shrivel, *scrimcan*, OHG. *screnchan*, Ger. *schränken*, Eng. *shrink*). A genus (*Crangon*) of macrurous decapod crustaceans of the family Carididae, closely allied to crayfish and prawns. The form is elongated, tapering, and arched as if hunchbacked. The claws are not large, the fixed finger merely a small tooth, the movable finger hook-shaped. The beak is short, affording ready distinction from prawns. The whole structure is delicate, almost translucent; the colors are such that the creature may escape observation, whether resting on a sandy bottom or swimming. Their quick darting movements betray them to one who looks attentively into a pool left by the tide. When alarmed they bury themselves in the sand, by a peculiar movement of the fanlike tail fin. The common shrimp (*Crangon vulgaris*) is abundant in the North Atlantic Ocean on the shores both of America and of Europe, wherever the bottom is sandy. It is about 2 inches long, greenish gray dotted with brown. It is esteemed in Europe as an article of food and is taken by nets. The shrimp industry of the southern Atlantic coast of the United States amounts to more than \$500,000 annually, while that of San Francisco Bay alone is worth half as much. The latter industry consists wholly in the capture, drying, and export to China of *Crangon franciscorum*.

**SHROP'SHIRE, or SALOP.** A border county of west England (Map: England, D 4). Area, 1346 square miles. Pop., 1901, 239,297; 1911, 246,306. The Severn, the principal river, pursuing a southeast course of 70 miles across the county, is navigable throughout. To the north and northeast of the Severn the county is generally level and is under tillage; to the south and southwest it is hilly and mountainous, in the Cleve hills rising to an altitude of 1800 feet, and here cattle breeding is extensively carried on. A breed of horned sheep is peculiar to this county. Shropshire is remarkable for its mineral wealth. Coal, iron, copper, and lead fields at Coalbrookdale, Snedshill, Ketly, etc., are extensively worked, and there are important iron industries. Capital, Shrewsbury.

**SHROVE'TIDE'** (from AS. *scrifan*, to shrive + *tīd*, time). The name for the days immediately preceding Ash Wednesday, which were anciently days of preparation for Lent; the chief part of the preparation consisted in

being shriven, or confessing. In the modern Roman Catholic church a trace of this is still preserved, as in many countries the time allowed for the annual confession, which precedes the Easter communion, commences from Shrove-tide. In Europe it became a time of amusement and sports, preceding the fast of Lent. In England festive banquets of the day are still represented by the pancakes and fritters from which Pancake Tuesday took its name. For the English customs of Shrove Tuesday, consult R. Chambers, *Book of Days* (new ed., Philadelphia, 1911). See CARNIVAL; COLLOP MONDAY.

**SHRUBBY BITTERSWEET.** See WAX-WORK.

**SHRUBBY TREFOIL.** See HOP TREE.

**SHRUBS** (variant of *scrub*, from AS. *scrob*, *shrub*). Plants which differ from herbs in possessing much woody tissue and which differ from trees chiefly in height, but partly also in the development of numerous primary shoots of approximately equal value. The distinction is largely artificial, since many transitions exist between these groups.

**SHTCHEDRIN**, sh̄tchēd-rēn', МИХАИЛ ЯЕВ-ГРАФОВИЧ (pseudonym of COUNT SALTYKOV) (1826-89). A famous Russian satirical writer, born in the Government of Tver. He studied at the lyceum in Tsarskoe Selo and obtained a government position. In 1847 appeared his first sketch, *Contradictions*, followed in 1848 by *A Complicated Affair*. For these he was exiled to Viatka, where he remained from 1848 to 1856 and acted as chief assistant to successive governors, until permitted to return to the capital, upon the accession of Alexander II. The experiences of his long exile he embodied in his *Sketches of Provincial Life* (1886-87). In 1858-60 he was acting Governor at various places; he resigned from the service in 1862 and later joined the editorial staff of the *Contemporary*. Pecuniary straits compelled him to reënter the service in 1864-68, after which he became coeditor of *The Annals of the Fatherland* with Nekrasov (q.v.) and on the latter's death in January, 1878, editor in chief. Just before his death he wrote the famous *Forgotten Words*—his last message to the dormant conscience of the Russian intellectuals. Shchedrin lashed bureaucratic corruption as unmercifully as he denounced the idle talk of would-be reformers. His characteristics were brought into still greater relief by his pathetic and loving treatment of the common people. In his *Trifles of Life* and his *Innocent Tales* (1887) he reached a larger conception of life than in his previous writings. His best work is *Messrs. Golovliev*, which can be enjoyed merely as a work of art.

**SHTIPLIE.** See ISTB.

**SHU'BRICK**, WILLIAM BRANFORD (1790-1874). An American naval commander, born on Bulls Island, S. C. In the War of 1812 he served on the *Hornet* and *Constellation*, became lieutenant in 1813, assisted in defending Norfolk, and was attached to the *Constitution* at the time she captured the *Cyane* and the *Levant* in West Indian waters (1815). He took part in the Mexican War, commanding the naval forces in the Pacific and capturing ports on the coast. In 1853 he became chief of the Bureau of Construction. In 1859 he commanded a fleet sent to Paraguay to exact reparation for firing on the United States steamer *Waterwitch* and obtained both apology and indemnity. He remained with the Union in the Civil War,

though a South Carolinian by birth. He was retired with the rank of rear admiral in December, 1861.

**SHUFELDT**, shōf'felt, ROBERT WILSON (1850- ). An American ornithologist and surgeon, born in New York. He was educated at Cornell and at Columbian (now George Washington) University (M.D. 1876). During the Civil War and later in frontier Indian wars he was an army surgeon, retiring in 1891, but being promoted to major in 1904. In 1882 he was curator of the Army Medical Museum, Washington, and later was honorary curator of the Smithsonian Institution. He wrote extensively in the fields of medicine, travel, anthropology, and especially ornithology, having made notably important researches in bird anatomy. Besides some 1200 articles and monographs, he published among other books: *Contributions to the Anatomy of Birds* (1882); *The Myology of the Raven* (1890); *Lectures on Biology* (1892); *Osteology of Owls* (1900); *Osteology of Pigeons* (1901); *Osteology of Herodiones* (1901); *Osteology of Birds* (1907); *Further Studies of Fossil Birds* (1913); *America's Greatest Problem: the Negro* (1915).

**SHUFFLEBOARD**, or **SHOVELBOARD**.

An indoor game played by two or four persons with iron weights. These weights are slid along a board. The board is about 30 feet long; the weights or pieces used in the game are two sets of four each, weighing about a pound each. The players are divided into opposing sides, each side using one set of pieces. The board is sprinkled with fine sand and has lines drawn across it 5 inches from each end, one for the starting line and one for the finishing line. Each player in turn slides his piece along the board, which if it projects partly over the edge scores three points for the player, and if it lie on the finish line or between it and the edge of the board it will score two points, and is said to be in; the piece nearest the line scores one. In every round the players change ends. The game is for 21 points. When played on ocean steamers a figure is chalked on the deck and wooden weights are used. Instead of being pushed by hand, a long staff with a curved end is used, each player taking his turn, but nothing being scored till the end of the round. In both games an enemy's weight may be knocked out of the game altogether or a friend's shoved in by a blow from the succeeding player. In the steamer game the winner must make exactly 50 points, all in excess of that number being subtracted instead of added.

The origin of shuffleboard is probably similar to that of bowling, quoits, and curling. It was so popular during the reign of Henry VIII of England, that it was forbidden by law because it turned the people from the practice of archery.

**SHULCHAN ARUCH**, shul-kān' ā-rōōk'. See TALMUD.

**SHULL**, GEORGE HARRISON (1874- ). An American botanist, born in Clark Co., Ohio. He graduated from Antioch College in 1901 and from the University of Chicago (Ph.D.) in 1904, served as botanical expert to the United States Bureau of Plant Industry in 1902-04, and thenceforth was a botanical investigator of the Carnegie Institution at the Station for Experimental Evolution, Cold Spring Harbor, Long Island, giving special attention to the results of Luther Burbank's work. He is

author of contributions on variations, heredity, and plant breeding.

**SHULLUHS**, shül-lüz', **SHILLUHS**, shil-lüz', **SHILHAS**, shil-hüz' or shi-lüz', or **SHLUHS**, shlüz'. The name applied to the Berber tribes on the Adrar Mountains in the western Sahara and the northern slopes of the Atlas Mountains in Morocco. They are Hamitic, but have an infusion of Semitic and of negro blood. In somatic and cultural respects they differ so little from their kinsfolk, the Haratin, Kabyles, and Tuaregs (see **HARATIN**; **KABYLES**; **TUAREG**), that all four may be classed together as Berber (q.v.) or Imazighen (q.v.).

**SHUMAGIN** (shōō'mā-gēn) **ISLANDS**. A group of islands southwest of Kodiak, Alaska (Map: Alaska, F, G 8). They were discovered by Bering in 1741 and were named for one of his sailors, who was there buried. Unga, the largest, is a Federal judicial station. The group is suited to fox farming, and under the provisions of an executive order of 1904 the following islands have been leased for such purpose: Bird, Big Goose, Chernabuna, Little Koniui, Popof, and Simeonof. The headquarters of the Alaskan codfishery is located on Unga.

**SHUMLA**, shum'la (Bulg. *Sumen*, shōō'mēn). A town in the Kingdom of Bulgaria, situated among the foothills of the Balkans about 60 miles west of Varna (Map: Balkan Peninsula, F 3). Its position at the converging of several roads and near some of the principal passes over the Balkans gave it formerly great strategical importance, and it is still an important military centre. The Turkish quarter of the town has a number of interesting mosques and other public buildings, while the Christian part is rather poorly built. The principal products are wine, silk, copper ware, and cloth. Pop., 1900, 22,928; 1910, 22,225, of whom about one-third were Turks. Shumla fell into the hands of Sultan Amurath I towards the end of the fourteenth century. It was strongly fortified in the eighteenth century and withstood three attacks by the Russians, in 1774, 1810, and 1828. The Russians occupied it in 1878.

**SHUN-CHIH**, shun'chē' (1638-61). The reign title (1644-61) of Fu-lin, the first Emperor of the present Manchu dynasty—the ninth son of T'ien-tsung, under whom the Manchus came into possession of Peking. T'ien-tsung died in September, 1643, and, his successor being a child, the government was taken by his uncle as Regent, who immediately set about consolidation of Manchu power, acting with wisdom until his death in 1651, when Shun-chih himself ruled. He continued the policy of conciliation, leaving the Chinese officials in control of the civil administration and falling in with Chinese ideas, customs, ceremonies, etc. Only one sign of servitude was insisted on—that of shaving the head and wearing the queue. Shun-chih treated Roman Catholics with favor and continued Adam Schall in his position of President of the Tribunal of Mathematics. He died in 1661 and was succeeded by his son, the famous K'ang-hi (q.v.). Consult H. A. Giles, *China and the Manchus* (Cambridge, 1912).

**SHUNT** (probably a variant of *shunden*, from AS. *scyndan*, OHG. *scuntan*, to hasten, urge). A branch or a parallel circuit for the passage of a portion of an electric current flowing between two points on a conductor. As the amount of current flowing through the shunt depends upon its resistance, it is so constructed that

this quantity is some definite fraction of the resistance of the principal conductor. Thus, with a galvanometer it is customary to employ a shunt having  $\frac{1}{10}$ ,  $\frac{1}{100}$ , or  $\frac{1}{1000}$  the resistance of the galvanometer, allowing but  $\frac{1}{10}$ ,  $\frac{1}{100}$ , or  $\frac{1}{1000}$  part of the current to flow through the coils and making it necessary to multiply the deflection observed on the tangent scale by 10, 100, or 1000, in order to determine the deflection that the entire current would produce. In a shunt-wound dynamo (see **DYNAMO-ELECTRIC MACHINERY**) there is a branch circuit current through the field coils from the armature, so that only a portion of the current passes through these coils, though there is the same difference of potential as at the commutator of the armature. Consult J. A. Fleming, *Handbook for the Electrical Laboratory and Testing Room* (London, 1902), and S. P. Thompson, *Elementary Lessons in Electricity and Magnetism* (rev. ed., New York, 1915).

**SHUR**. See **MOONJA**.

**SHURI**, or **SHIURI**, shōō'rē'. The capital of the Kingdom of Luchu until the islands were entirely incorporated into the Empire of Japan. (See **LUCHU**; **OKINAWA**.) It stands about  $3\frac{1}{4}$  miles inland from Napa (Map: Japan, G 7). It is a straggling town, with the castle or King's palace perched on a hill about 500 feet high in the centre. Pop., 1908, 25,141.

**SHURTLEFF**, ROSWELL MORSE (1838-1915). An American landscape painter. He was born at Rindge, N. H., and graduated from Dartmouth College in 1857. Beginning as an architect, lithographer, and illustrator, he studied painting at the Lowell Institute, Boston, and at the National Academy of Design, New York. After the Civil War, in which he participated—being held a prisoner in the South for nearly eight months—he illustrated books and magazines in New York for several years and in 1870 first attempted oil painting. In 1890 he was elected a member of the National Academy. Good examples of his work, which are usually sunlit forest interiors rendered in a broad and lucid manner, are: "The First Snow" (Corcoran Art Gallery, Washington); "The Mysterious Woods" (National Gallery, Washington); "A Mountain Stream" (Metropolitan Museum, New York); "Through Woodland Shades" (1908); "The Edge of the Wood" (1911); "Autumn Forest" (1914).

**SHUSAN**, shōō'sān. See **SUSA**.

**SHUSHA**, shōō-shā'. A district town in the Government of Yelizavetpol, Transcaucasia, 80 miles south of Yelizavetpol (Map: Russia, G 7). It produces mainly silk, leather, and costly carpets. Pop., 1911, 46,687, chiefly Armenians.

**SHUSHWAP**, shōō'swōp (properly *Súq-apmuq*). An interesting tribe of Salishan stock occupying territory extending from the main divide of the Rocky Mountains to Fraser River and from Quesnelle to Shushwap Lake, southern British Columbia. They are divided into several village communities; their houses were circular dugouts about 4 feet below the ground and roofed with logs and thatch covered with earth. Their dress was of furs or buckskin, and tattooing was practiced by both sexes, together with the wearing of nose pendants. They excelled in the making of pine-root basketry and mats woven from rushes. They used sea shells and copper bracelets as currency medium, obtaining copper by trade or from diggings. The tribe did not have the clan system. Inheritance was

in the male line, and there was an order of hereditary chiefs, who regulated the division of labor and parceled out the fish and berry harvest, but did not lead in war, that duty falling upon elective war captains. Their weapons were the bow, lance, stone club, and a sort of bone sword, and they had body armor of quilted elkskin or strips of wood. Slaves were held by war and purchase and were frequently either killed by the grave of their owner or buried alive with the corpse. The mourning period lasted for a year, ending with a feast at the grave, on which occasion the son adopted his dead father's name. There were many peculiar marriage, puberty, and hunting ceremonies and tabus. With the exception of a few families all are now civilized and Christianized by the effort of Catholic missionaries and are reported by their agent to be generally industrious, law-abiding, progressive, healthy, and increasing in numbers. See SALISMAN STOCK.

**SHUSTER**, shōō'stēr, or **SHUSHTER** (anciently *Sostra*). A city in the Province of Khuzistan, Persia, on the Karun, 30 miles southeast of Dizful (Map: Persia, C 6). It is poorly built, with narrow unpaved streets and houses of mud and stone. On an abrupt sandstone hill above the city stands the citadel, partly in ruins. Among the mosques is the imposing Masjed i Juma. In the early part of the nineteenth century Shuster was the capital of the province and had a population of 45,000. Pop., 1910, about 12,000.

**SHUSTER**, W(ILLIAM) MORGAN (1877- ). An American financial expert, born in Washington, D. C. He studied for a time at Columbian (now George Washington) University and Law School. Between 1899 and 1906 he was in the customs service in Cuba and Manila. In 1906-09 he was a member of the Philippine Commission and secretary of public instruction in the islands. While treasurer general and financial adviser of Persia in 1911-12 a fearless and honest administration of his office involved him in difficulties with the Russian and British governments. His criticism of Russian intrigues in Persia made him for a time an outstanding figure in international politics; finally, with the occupation of Persian territory by the Russian troops, the situation became so acute that Shuster was compelled to resign. In 1916 he visited the Philippines. He wrote *The Strangling of Persia* (1912).

**SHUTE**, HENRY AUGUSTUS (1856- ). An American author. He was born at Exeter, N. H., graduated from Harvard in 1879, was admitted to the bar in 1882, and after 1883 was judge of the police court at Exeter. His books, amusing and among the most successful of their kind, include: *The Real Diary of a Real Boy* (1902; 12th ed., 1906); *Sequel* (1904); *Letters to Beany and Love Letters of Plupy Shute* (1905); *Real Boys* (1905); *A Few Neighbors* (1906); *A Profane and Somewhat Unreliable History of Exeter* (1907); *The Country Band* (1908); *Farming It* (1909); *A Country Lawyer* (1911); *Plupy "the Real Boy"* (1911); *The Misadventures of Three Good Boys* (1914).

**SHUTT**, FRANK THOMAS (1859- ). A Canadian agricultural chemist. He was born in London, England, removed to Canada in early manhood, and graduated at Toronto University in 1885. He was demonstrator in chemistry in that university in 1885-87 and in the

latter year was made chemist of the Dominion experimental farms. He made noteworthy researches in maintaining and increasing soil fertility and in the conservation of soil moisture. He was elected a member of several learned societies in Canada and abroad.

**SHUTTLE**. See LOOM; SEWING MACHINE.

**SHUTTLEWORTH**, EDWARD BUCKINGHAM (1842- ). A Canadian pharmacist. He was born at Sheffield, England, and was educated in Dublin and at the Royal School of Science. Going to Canada, he began research work in chemistry and bacteriology and was prominently identified with the development of the chemical industry in Toronto. In 1866, with others, he founded the Canadian Pharmaceutical Society, which became the Ontario College of Pharmacy and in which Shuttleworth was dean and professor of chemistry in 1882-91. He was also a member of the medical faculties of Trinity and Victoria universities and professor in the Ontario Medical College for Women.

**SHUTTLEWORTH**, SIR JAMES PHILLIPS KAY-. See KAY-SHUTTLEWORTH, SIR J. P.

**SHUVALOV**, shu-vā'lof, PAUL ANDREYEVITCH, COUNT (1830-1908). A Russian statesman, brother of Count Peter Shuvalov. After graduation from the Military School for Pages, he took part in the Crimean War. In 1867 he was appointed chief of the staff of the guards; later was commander of the military district of St. Petersburg; served with distinction in the Russo-Turkish War of 1877-78; and from 1885 to 1894 was Russian Ambassador at Berlin. After two years as governor-general of the Warsaw military district he was appointed, (1896) a member of the Imperial Council. During his long and brilliant career Count Shuvalov received many honors.

**SHUVALOV**, PETER ANDREYEVITCH, COUNT (1827-89). A Russian diplomat, brother of Count Paul Shuvalov. He was born in St. Petersburg, served in the army, and in 1864 was appointed Governor of Courland. Two years later he was made minister of police and in 1873 was sent on a diplomatic mission to London. Soon afterward appointed Russian Ambassador to England, he displayed much ability during the strained relations at the time of the Russo-Turkish War of 1877-78. When a break between England and Russia seemed inevitable, he succeeded in arranging with Lord Salisbury for the Congress of Berlin. He was recalled in 1879.

**SHUYA**, shōō'yā. A district town in the Government of Vladimir, Russia, situated on the Teza, 186 miles northeast of Moscow (Map: Russia, F 3). It has extensive cotton mills. Pop., 1911, 30,702.

**SHYLOCK**. The Jew usurer in Shakespeare's *Merchant of Venice*, the central figure in the play, standing for the vengeful spirit of an oppressed race.

**SIA**, sē'a. See KERESAN STOCK.

**SIALKOT**, sē'al-kōt', or SEALKOTE. The capital of the District of Sialkot in the Punjab, India, on the Aik River, 72 miles by rail northeast of Lahore (Map: India, C 2). Objects of interest are the ruins of an old fort, and the shrine of Hanak, the first Sikh guru. The city is the commercial centre of a productive agricultural and cotton-growing section and manufactures paper, cotton goods, silks, shawl trimming, pottery, cutlery, etc. Pop., 1901, 57,956; 1911, 64,869.

**SIAM**, sī-ām'. An independent kingdom of southeast Asia, between Burma on the west and French Indo-China on the east and opening to the south by the Gulf of Siam. Apart from its long, narrow arm, known as Lower Siam, extending southward in the Malay Peninsula to the Straits Settlements, it forms a compact region, known as Upper Siam, lying approximately between lat. 12° and 20° 40' N., and long. 98° and 106° E. Both French and English encroachments have been constant until the French claims and boundary line were settled in 1907 and the British in 1909. Area about 195,000 square miles; Malay Peninsula about 45,000.

The western boundary of Siam marks in the main the high granite backbone of the peninsula, although for about 100 miles in the northwest the Salwin River of Burma separates the two countries. In central Siam lies the little-known Korat Plateau. Between these two elevations is the great valley of the Menam River (q.v.) with its large tributary, the Meping. The Menam rises in the mountain district of the Laos country in the north of Siam and flows south, emptying into the Gulf of Siam below Bangkok. This area abounds with swamps and jungles, but the national wealth and commerce are found here, and it constitutes the real Siam, the bulk of the population living along these streams. East of the Korat watershed is the valley of the Nam Mun River. This stream flows eastward and enters the great Mekong, which forms most of the north and southeast frontier. The Laos inhabitants in the north live usually in small communities on the river banks. The geology of the country has not been fittingly studied, but the limestones and dolomitic formations, the basaltic districts and metamorphic schists, represent here in general a broken and complicated geological area.

Siam is in general a well-watered country. The climate is tropical, but not one of great extremes. The humidity makes it trying for Europeans and somewhat unhealthful, especially in the wet season from May to October. The rainfall is in some sections as high as 240 inches; at Bangkok it is about 50 inches. Siam lies in the paths of the monsoons, which determine its seasons. In general the usual temperature ranges from 65° to 90°, the northern and higher regions being drier and cooler, the thermometer at night there often falling below 50°. The cool season begins in November. In the north the teak tree abounds and oak and pine grow. Siam furnishes also rosewood, ebony, and many tropical woods and fruits. Elephants roam wild, and are also useful. The rhinoceros, tiger, leopard, gaur, water buffalo, flying fox, gibbon, and crocodile are plentiful.

Siam is not conspicuous as a mining country, though many minerals are found, including tin, wolfram, copper, iron, zinc, lead, antimony, gold, rubies, and sapphires. The only minerals worked on a commercial scale are tin and wolfram, tin being far the more important. The export of tin and of tin ore expressed in its metal equivalent amounted to 82,256 piculs in 1910-11. Wolfram is worked by a British company in Koh Samui and on a very small scale in Puket; rich deposits elsewhere are known. Gold washing in the streams is carried on in a small way in parts of the country, and some rock mining in Tomoh. Since the cession of the Pailin district to the French in 1907, the gem industry has fallen in importance.

In the northern and middle part of the country large forests abound, of which by far the most valuable tree is the teak. Teak cutting is mainly under British control. The logs are floated down the Menam to Bangkok; in the season of 1913, 99,046 logs passed the duty station at Paknamphoh.

Agriculture, still largely in a primitive state, receives most attention in the valleys. The great alluvial Menam Plain, with its inundating features and irrigation facilities, is one of the richest of agricultural regions; but irrigation properly practiced is found mostly in the north. Rice is the chief product, the principal food of the people, and the staple export. Other crops are cotton, hemp, sesame, tobacco, pepper, and fruits. Of considerable importance is the raising of live stock, which includes water buffalo, cattle, horses, and swine.

Imports and exports for 1912-13 are stated at 76,225,000 and 81,971,000 ticals respectively. In the latter year the rice export amounted to 65,320,000 ticals, and teak 5,600,000. The largest import is cotton goods; other large imports are oils, sugar, and silk goods. Most conspicuous in the foreign trade are Singapore, Hongkong, the United Kingdom, and China. Trade is largely in the hands of foreigners, notably Chinese.

The first railway in Siam, from Bangkok to Paknam, about 12 miles, was opened to traffic in 1893. The first important enterprise was the state line from Bangkok to Korat, which was begun in 1892, reached Ayuthia and Geng-koi in 1897, and was opened to traffic to Korat (164 miles from Bangkok) in 1900. The first section of a line branching from this railway at Ban Phaji (56 miles from Bangkok) was opened to Lopburi in 1901; it has been continued northward through Paknamphoh (1905) and Pitsanulok (1908) to a point beyond Utaradit (1909), and will ultimately reach Chiangmai and Chiengsen. These railways, the Northern Line, aggregated 476 miles at the beginning of 1915. A line from Bangkok (39 miles), known as the first section of the Eastern Line, was opened in 1908. Other railways in the south, including the Southern Line, which is projected to reach the west coast at Trang and the Kelantan border, totaled 315 miles at the beginning of 1915. State railways thus totaled 830 miles; in addition there were 65 miles of private railway, the total mileage for the country being 895.

The condition of public finance, for which a British officer acts as adviser, is very favorable. There is an excess of ordinary revenue over ordinary expenditure. For 1913-14 and 1914-15 respectively the estimated revenue was 65,094,000 and 68,000,000 ticals (par value of tical, 37.085 cents); expenditure against revenue, 64,599,000 and 67,997,000; extraordinary expenditure, against capital account (including expenditure from loans), 15,228,000 and 17,327,000. Revenue is derived from the opium tax, customs, railways, capitation tax, land tax, tax on spirits, mines, fisheries, etc. There was no national debt until 1905, when a loan of £1,000,000 was contracted. Railway construction made further loans necessary, and the total debt at the end of 1914 stood at £6,257,400.

The political régime has long been enlightened and progressive. The government is an absolute monarchy, the succession now passing from father to son. The King is assisted by a

cabinet, whose members are the heads of the several departments of national administration: foreign affairs, finance, justice, interior, war, marine, police, public works, public instruction, etc. These officials are for the most part relatives of the King. Besides the British financial adviser there are foreign advisers in various departments of government. Since 1895 there has been a Legislative Council. It is formed of the cabinet and officials and 12 other persons selected by the King. Its members number upward of 50. Siam is divided into 17 circles (monthons), which are subdivided into provinces (muangs), and the latter into districts (amphurs). The monthons are under the Ministry of the Interior, except the metropolitan monthon of Krung-Thep, which is under the Ministry of Local Government. At the head of each of the other monthons is a high commissioner, to whom the provincial governors are responsible. Over each district is an official responsible to the governor. A general conference of the high commissioners is held annually at Bangkok.

There is an international court in which suits of foreigners against Siamese are brought. The legal code is being modernized, and the police force has been remodeled, extended, and made effective under English guidance. The monetary unit is the tical, par value 37.085 cents. Siam has been on a gold exchange basis since 1908. The chang (catty) represents 2½ pounds avoirdupois. Fifty changs make a haph (picul), 133½ pounds.

**Army.** In theory military service is universal and compulsory from the age of 18 to 35. In practice there are many exempted classes, and among certain of the backward tribes service is not required. Service with the colors in the active army is for two years—in the first reserve five years, in the second reserve 10 years. In peace there are 10 skeleton divisions, consisting of two regiments of one battalion each, one regiment of cavalry of two squadrons, two batteries of four guns each, one battalion of engineers. In war the organization expands to two regiments of three battalions, one regiment of three squadrons, one battalion of three batteries, one battalion of engineers. Peace strength, 12,000 men. Arms, infantry, the Mauser rifle; artillery, a German 75-millimeter field gun. See NAVIES.

The population is stated by a census of 1910 as 8,149,487, consisting in part of about 2,500,000 Siamese, 1,600,000 Chinese, 1,350,000 Laotians, 490,000 Cambodians and Annamites, and 750,000 Malays. Bangkok, the capital, is the only large city. Chiangmai, the capital of the Laos country, with over 50,000 inhabitants, is the leading town in the north, where the various tribes of the Thai race are found. In the extreme south are the Malays. The natives have largely intermarried with the energetic Chinese. The Siamese themselves are indolent and indifferent. As the Thai in the limited sense, they form the most important civilized section of the Thai stock of Farther India, akin to the Laotians and Shan tribes of the northern and eastern regions of Siam. The primitive Thai type has been very much changed among the Siamese by intermixture with the Khmers, Kuis, Hindus, and Malays. Physically they are above the average in stature, with very brachycephalic skulls, olive complexions, prominent cheek bones, lozenge-

shaped faces, and short flat noses. Their hair is dark. Although polygyny and concubinage are permitted by custom, the mass of the Siamese are practically monogamous, with few divorces. There is no caste. The Siamese language is the "monosyllabic, tonic type," characteristic of the more or less cultured nations of Farther India. The Siamese are generally Buddhists of the orthodox or southern school. The priests have hitherto had complete charge of education. The Malays are Mohammedans. The missionaries are either French Roman Catholics or American Protestants, whose efforts, while not resulting in numerous conversions, have accomplished much philanthropic work. The facilities for modern education have been radically extended during recent years. In Bangkok and the provinces the government maintains many schools and aids in supporting others, among them a normal institution, a home school with English instructors for the sons and daughters of titled and other families, vernacular schools, cadet colleges, and medical, civil service, law and engineering colleges which have now been incorporated into the newly chartered Bangkok University.

**History.** The fabulous history of Siam goes back to the fifth century B.C. An attempt is made to show the descent of the King from Gautama Buddha and of the people from his immediate disciples. Authentic history begins in the middle of the fourteenth century A.D. Long before, there were many immigrations from the north, with shifting dynasties, frequent wars, and uncertain fortunes. In the middle of the fourteenth century the King, known posthumously as Phra Rama Thiboda, built Ayuthia on the site of an ancient town and made it the capital. He extended the Siamese power southward into the Malay Peninsula and eastward into Cambodia. For 200 years peace and prosperity prevailed. Ayuthia became a large and rich city. In the middle of the sixteenth century it was captured by an army from Pegu and thenceforth for more than 200 years there were wars of varying fortunes with Burma, Pegu, and Cambodia. In the seventeenth century a considerable intercourse with Europe, China, and Japan was carried on. In 1759 the Burmese captured Ayuthia and after a long struggle conquered the whole country (1767). They introduced a king of their own, and upon the withdrawal of their army anarchy ensued. A Chinaman, the leader of a band of freebooters, seized Bangkok and, to the joy of the people, expelled the Burmese. He proclaimed himself King, as P'ya Tak. He extended his power southward and eastward, but was assassinated in 1782 by one of his generals, Yaut Fa, who established the present dynasty, the ruling monarch being seventh in descent from him. In 1820 intercourse with the West was renewed, and in 1826 a treaty was made with Great Britain and soon after similar treaties with other nations. In 1855 Great Britain made a treaty which established extraterritoriality and put trade on a secure footing. The French protectorate over Cochinchina delivered Siam from its ancient enemies to the east of the Mekong, Cambodia having been previously reduced to the position of a dependency. But France desired access to China by means of the river system of the peninsula, and it presently found a pretext for aggression. It accused Siam of encroaching on the territory

of Anam, and sent its fleet to Bangkok (1893), where it dictated terms of peace. Cambodia and all the territory east of the Mekong were to be under French protection; a belt extending for a distance of 25 kilometers west of the Mekong was neutralized, and valuable trade privileges were conceded. Since that time the French sphere of influence has been extended still farther west. By the Franco-Siamese convention of 1904 France obtained control of about 8000 square miles to the west of the Mekong in the south, as well as of the trans-Mekong portion of the Laos State of Luang Prabang in the north. By the Anglo-French convention of the same year the territories to the west of the Menam and the Gulf of Siam were recognized as in the British, and those to the east as in the French, sphere of influence. The two powers also guaranteed the future integrity of Siamese territory. In 1907 more territory was ceded to France, and in 1909 three states were ceded to Great Britain. In 1912 a conspiracy against the King was discovered and put down with great severity.

Young, *The Kingdom of the Yellow Robe* (3d ed., London, 1907); Julien Viaud (Pierre Loti, pseud.), *Siam* (Eng. trans. by W. P. Baines, ib., 1903); also *The Directory of Bangkok and Siam* (Bangkok, annually).

**SIAM. GULF OF.** An arm of the China Sea, lying between the Malay Peninsula on the west and French Indo-China on the east (Map: Siam, D 5). It is 235 miles wide at its entrance and extends inland in a northwesterly direction a distance of 470 miles. Four rivers, navigable for a considerable distance, the chief of which is the Menam, fall into the gulf.

**SIAMANG**, sē'a-māng or syā'māng (Malay *siāmang*). The largest of the gibbons (q.v.), distinguished from the others by the circumstance that the second and third toes of the foot are joined together as far as the last joint in the male and to the middle joint in the female; hence the technical name, *Hylobates*, or *Symphalangus, syndactylus*. It stands 3 feet high and is glossy black except for a whitish beard. The hair is comparatively long and, unlike that of other gibbons, grows upward from the wrist towards the elbow. The home of the Siamang is Sumatra, where it dwells in troops in the forests, swinging through the tree tops with amazing agility. It is numerous and is frequently captured, but does not endure captivity well.

**SIAMESE** (sī'a-mēz' or sī'a-mēs') **TWINS**

(1811-74). A name given to two youths, Eng and Chang, born of Chinese parents in Siam, who had their bodies united by a band of flesh, stretching from the end of one breastbone to the same place in the opposite twin. See **MONSTROSITY**.

**SI-AN-FU.** See **SI-NGAN-FU**.

**SIANGTAN**, syāng'tūn'. A prefectural city of China in Hunan, on the Siang River (Map: China, K 6). It has extensive suburbs and stretches along the bank of the river for 4 miles. It is the commercial centre of Hunan and lies on one of the great water routes from Peking to Canton. Pop., 300,000.

**SIANGYANGFU**, syāng'yāng'fū' (the *Saianfu* of Marco Polo). A departmental city of the Province of Hupeh, China, at the confluence of the Han and Pai rivers, the Han giving the town large trade through Hupeh. Otherwise the town is not so important as Fancheng, on the opposite bank of the Han, which has silk, carving, and other industries (Map: China, K 5). Siangyang and Fancheng are both noted for the resistance they offered to the armies of Kublai Khan in 1268-73, surrendering only when Marco Polo's father and uncle came to the assistance of the Mongols. Pop., 50,000.

**SIBALÓM**, sē'bá-lón'. A town of Panay, Philippines, on the left bank of the river of that name in the Province of Antique, situated 9 miles northeast of Buenavista. Pop., 1903, 12,461.

**SIBAWAIHI**, sē'bá-vī'hé. The current name of Abu Bishr 'Amm ibn Uthman ibn Kaubr, an Arabic grammarian of the eighth century. He was a Persian and studied at Basra. He returned to Persia and died near Shiraz in 793 or 796. His *Kitāb* (book) is the oldest systematic presentation of Arabic grammar and remains the classic study of the subject. Derenbourg has published his text in *Le livre de Sibawaihi* (Paris, 1881-89), translated, with Arabic commentaries, by Jahn, in *Sibawaihi's Buch über die Grammatik* (Berlin, 1894).

**SIBBALD**, sīb'ald, **SIR ROBERT** (1641-1722). A Scottish physician, geographer, and historian, born in Edinburgh. He graduated at Leyden (M.D.) in 1661 and at Angers in 1662. He practiced in his native city until 1685. In 1667 he opened a botanical garden for the study of the medical properties of herbs and in 1681 was one of the founders of the Royal College of Physicians of Edinburgh (president, 1684). The following year he was appointed physician to King Charles II and geographer of Scotland. His geographical and statistical notes for a description of the natural history of Scotland, *Scotia Illustrata* (1684), was attacked by Dr. Piteairne (q.v.) and resulted in a controversy. In 1685 he was appointed professor of medicine at Edinburgh University. For two years he was a Roman Catholic and lived in London, because of Scottish hostility to this faith. Sibbald was a prolific writer, especially on geographical and historical subjects. A number of his essays appeared in 1739 under the title *A Collection of Several Treatises in Folio Concerning Scotland*.

**SIBBALD'S** (sīb'aldz) **WHALE**, or **BLUE WHALE**. A rorqual (*Balaenoptera sibbaldi*), the largest known whale, reaching a length of 85 feet or more and exceeding in bulk all other whales and all other known animals living or extinct. It passes most of the year in the open ocean, wandering into every sea, but early

in summer approaches northern coasts for the purpose of reproduction. At this time its sole food is a small schizopod crustacean (*Euphausia*), similar to the opossum shrimp, which swarms in the North Atlantic. This whale is dark bluish gray in color with whitish spots on the breast and black baleen. See WHALE.

**SIBELIUS**, sé-bá'l'i-us, JEAN (1865- ). The greatest of Finnish composers, born at Tavastehus. From 1885 to 1888 he studied under Wegelius at the Helsingfors Conservatory. Then he took a course in counterpoint with A. Becker in Berlin and spent 1890-91 in Vienna, studying with Goldmark and R. Fuchs. In 1893 he was appointed professor of composition at Helsingfors Conservatory. His first compositions showed striking originality and attracted general attention, and, to enable him to devote his entire time to composition, the Senate of Helsingfors voted him a liberal annuity. When he visited the United States in 1914 to conduct some of his works at the twenty-eighth Norfolk (Conn.) Festival, Yale University conferred upon him the degree Mus. Doc. The music of Sibelius is founded upon the folk melodies of Finland, his chief sources of inspiration being nature and the national sagas; his characteristics, earnestness and sublimity, with little joy or merriment. His command of technical details is supreme, with instrumentation full of subtle lights and shadows, feeling deep and sincere, artistic taste unerring. His principal works are an opera, *The Maid in the Tower* (1896); incidental music to Paul's *König Christian II*, Maeterlinck's *Pelléas et Mélisande*, Paul's *Die Sprache der Vögel*, Strindberg's *Svanevit*; four symphonies (E minor, D, C, A minor); the symphonic poems *The Swan of Tuonela*, *En Saga*, *Finlandia*, *Frühlingslied*, *Lemminkäinen zieht heimwärts*, *Nächtlicher Ritt und Sonnenaufgang*, *Pohjola's Daughter*, *The Dryad*, *Belsazar's Gastmal*, *Aallottaret* (Nymphs of the Ocean); *Luonnotar*; a violin concerto in D minor; a funeral march, *In Memoriam*; a pantomime, *Scaramouche*; some choral works; piano pieces; songs, one of which, *Svarta Rosor*, is especially celebrated. Consult Rosa Newmarch, *Jean Sibelius, A Finnish Composer* (Leipzig, 1905).

**SIBERIA**. An opera by Giordano (q.v.), first produced in Milan, Dec. 19, 1903; in the United States, Feb. 5, 1908 (New York).

**SIBERIA**. An Asiatic possession of Russia, embracing more than one-half of the area of the entire Empire—4,831,882 square miles, more than one and one-half times as great as that of the United States (exclusive of Alaska). It is divided politically into four governments, Irkutsk, Tobolsk, Tomsk, and Yeniseisk, and six provinces, Amur, Kamchatka, Primorskaya, Sakhalin, Transbaikalia, and Yakutsk. While most of Siberia has belonged to Russia for some centuries and about 90 per cent of the population is of Russian origin, the Amur lands and the southern part of the littoral (Pacific coast) were not detached from China till 1858 and include only a moderate number of Russians.

**Topography.** Excepting in the Amur basin and the Pacific littoral the country slopes gently from south to north, carrying the drainage to the Arctic Ocean. The Arctic shore is low, flat, indented in the west, more regular in the east, and only in the Taimyr Peninsula, with low mountain ranges roughly paralleling the coast, is the plainlike character broken. The barren

tundra merges gradually near the Arctic circle into the marshes and forest belt to the south, and these in turn in the west merge into the agricultural tracts of southern Siberia. A peculiar feature of the tundra is that the soil is perpetually frozen to great depths, the frost going down near the pole of cold, east of the Lena River, to a depth of 650 feet. Intervening in this frozen soil are layers of clear blue ice, called ground ice. In this frozen mass the remains of mammoths and other animals have lain probably since the time of the great glacial epoch. The surface thaws in summer, covering the northern regions with almost impassable mud, but permitting the growth of short-season flowers. The coast lands of the Pacific frontage, on the contrary, in a region of more abundant rain are fringed by high forest-clad mountain ranges so near the sea that little opportunity is given for deep indentations, there being long stretches of nearly straight shore line. Siberia has only a few islands of much importance, the new Siberian group of the Arctic and northern Sakhalin in the Pacific being most noteworthy. The surrounding seas are shallow, usually for a long distance from the land. South of the Arctic region the Yenisei River divides Siberia into two greatly differing parts. The region to the west, nearly the whole of West Siberia, consists of vast level plains, almost completely covered in the northwest with one of the most extensive swamp regions of the world, in which many rivers wind sluggish and tortuous courses. The region of swampy lands embraces nearly all of the Government of Tobolsk and the northern part of Tomsk; scattered through the swamp area and over the southern plains are thousands of lakes, most of them very small, relics of the ice age. The eastern part of Tomsk belongs in topographic aspects to eastern Siberia, which strikingly contrasts with most of the region west of the Yenisei. The southern part of this region is the chief region of agriculture and population.

As West Siberia is a land of low swamps, plains, and lakes, so eastern Siberia to the Pacific, especially in the south, is a land of low plateaus sloping gradually to the Arctic and surmounted by many ranges of mountains, not high but giving the country a rugged character. The ranges have a general northeast and southwest direction, following the trend of the backbone or central feature of the region—the chain known as the Yablonoi and Stanovoi mountains, which extends unbrokenly from the Chinese border east of Lake Baikal to Bering Strait, about 4300 miles. In the far north the ranges dwindle, so that the great low plain of north Euro-Asia is continued practically without interruption to Bering Sea. The eastern mountains are the region of mining, with agricultural opportunities in many valleys. The highest mountains are the Altai, Sayan, Yablonoi, and Stanovoi mountains, the culminating point, outside of Kamchatka, being the Byelukha, in the Katunski-Altai, which has an elevation of nearly 15,000 feet. The isolated mountain district of Kamchatka reaches in numerous peaks elevations of from 10,000 to nearly 15,000 feet and Mount Makachingu, the highest summit north of the Arctic circle, is 8500 feet high.

**Hydrography.** The four rivers, the Obi, Yenisei, Lena, and Amur (qq.v.), have great length and very extensive basins and with their numerous tributaries afford about 30,000 miles

of interior navigation. The Obi and its tributary the Irtysh are the most important rivers of Siberia, flowing as they do through the most fertile and populous districts in the southwest of the country. The Obi with its affluents supplies more than 9000 miles of navigation. Its estuary on the Kara Sea is very large, but vessels drawing more than 12 feet cannot enter it. Its long tributary, the Irtysh, is also navigable. The Yenisei is navigable for 1850 miles, and ocean steamers might ascend it for 1000 miles. The ice-choked northern sea, however, makes the Yenisei as well as the Obi unimportant in sea trade. Local trade and steam navigation are developing along the river, but its chief importance is as a link in the line of water communication between Lake Baikal in eastern Siberia and Tiumen, near the west boundary—a very important route more than halfway across Siberia. This route is by way of the Angara tributary of the Yenisei from Lake Baikal and Irkutsk by steamer 400 miles to Bratski Ostrog, where rapids obstruct steam navigation, though the improvements required to make steamers available around the worst rapids (1¼ miles) would not be very costly. Thence the route is uninterrupted to the Yenisei, down that river to the Kass, whose source lies near that of the Ket tributary of the Obi. These rivers were canalized and connected by a canal, so that boats pass between the Yenisei and the Obi (586 miles). The route continues on the Irtysh and its Tobol tributary to Tiumen, over 3000 miles by water from Irkutsk. At that point freight is transferred between boat and railroad. The route is at its best a very circuitous one, and it carries the principal products of Siberia to a land which abounds in similar products and in which, accordingly, they have a smaller value than they would have elsewhere.

The Lena is navigable by river steamers for 1750 miles from its mouth and serves considerable local traffic. The Yana and Kolima, other large Arctic rivers, are still little known. The Amur basin supplies 8940 miles of navigation including the Amur, the Shilka and Ingoda, the Seya and its tributaries, the Sungari and its tributaries, and the Ussuri. The great commercial disadvantage of the Siberian rivers is that they are open to navigation only from three to five months in the year. Lake Baikal, the largest fresh-water lake in Asia, is in eastern Siberia. Considerable agriculture is developing around its shores, and the government has constructed a number of ports to facilitate the lake trade.

**Climate.** The winters are long and very severe, but exceedingly dry; the summers are short and hot. In the agricultural districts of both eastern and West Siberia the mean annual temperature is approximately 32° F. The mean summer temperatures are 62° in the east and 63.5° in the west; the mean winter temperatures are -0.4° in the east and 1.4° in the west. Summer on the farming lands of West Siberia is as warm as in central Russia. The temperatures farther north are much colder. Verkhoyansk, northeast of Yakutsk, for a long time considered the coldest spot in the world, has a mean annual temperature of 3.2° F., a mean in January of -56° F. and a maximum cold of -90° to -93° F. The rivers are frozen from 160 to 200 days in the year. Excepting on parts of the Pacific coast the rainfall is small, sometimes insufficient to mature the wheat crop,

The annual rainfall at Aryan (Sea of Okhotsk) is 36 inches; Yakutsk, 10 inches; Kiakhta, 8 inches; Tobolsk, 18 inches.

**Flora.** The treeless northern tundras have mosses, lichens, and stunted shrubs on their surface. South of the tundras is the wide and extensive forest zone—first the low forests in which birch, larch, and silver fir grow vigorously enough to merit the name of trees; then, farther south, forests of large trees. The woodlands, from the Urals to Kamchatka, are interrupted only by the rivers, peat bogs, marshes, or narrow ravines. Conifers, the prevailing trees, including species common to Europe, and the *Pinus pichta* peculiar to eastern Siberia, is very tall and slender, but little used. The Siberian cedar (*Pinus cembra*), used for furniture, is of value. The most common and hardy tree is the larch, found throughout the forest zone. Many trees common to temperate Europe also occupy large areas. Forest fires have desolated much woodland.

**Fauna.** All the waters bordering Siberia, as well as its rivers and lakes, abound with fish, which are a large food resource. The real incentive to the Russian conquest of Siberia was the great abundance of animals whose furs in that climate have great softness, warmth, and lightness. Though, owing to overhunting, many of these have become extremely rare, Siberia is to-day the largest source of furs, surpassing Canada and Russia. Among fur animals of the forests are the polar hare and fox, the sable, otter, red fox, ermine, wolf, bear, and the gray squirrel, of which about 1,000,000 skins are taken every year. Burrowing animals are very numerous in the south. The tiger is still found in the south and southeast, especially abundant in the Amur region. The Arctic tribes have the reindeer, and the camel is used in the more southerly parts.

**Geology and Mineral Resources.** Most of the lowlands are overlaid with recent deposits resting upon Paleozoic or Mesozoic rocks. The extreme northeast is composed chiefly of Paleozoic rocks. The direction of the mountain ranges, chiefly granite, was determined ages ago by the great disturbances that fractured, folded, or upheaved the earth's crust. The high mountains of Kamchatka are distinguished by young eruptive rocks and active volcanoes. Gold mining in Siberia, which produces about two-thirds of Russia's gold, dates back to 1745, but it is only within the past decade that modern mining methods have made this industry important. In 1912 the mines yielded 1,014,157 troy ounces of gold and 134,465 ounces of silver, both amounting in value to \$20,687,094. But, for lack of good roads and owing to the high cost of labor, the gold-mining industry is still undeveloped. The quartz deposits had until recently been neglected, and the placers are worked by antiquated and expensive methods. Silver is mined chiefly in Nerthinsk (Amur region) and Semipalatinsk. Coal mining has been greatly stimulated by the opening of the Trans-Siberian railroad, no less than 100,000,000 poods of coal being mined in 1912. The production of copper in Siberia amounted to about 3780 tons in 1911. Little attention has yet been paid to the mining of iron, lead, and tin, though deposits of all these minerals are found. Siberia is particularly rich in graphite, used chiefly for lead-pencil manufacture.

**Agriculture.** Agriculturally, Siberia must

be divided into western and eastern halves. Western Siberia is more fertile and more thickly populated and is chiefly devoted to agriculture (nine-tenths of the inhabitants are tillers of the soil), while mining and hunting are still more prominent in east Siberia. All the land, with unimportant exceptions, belongs to the crown, which leases it to the separate communes, to be redistributed among the inhabitants from time to time. All the best farming land has been taken up, and many immigrants are now trying to make homes by the difficult operation of clearing timber from the southern edge of the woodlands. Farming, in the American sense, can be carried on only in the south (in the west up to lat. 60° N.; in the east to 55°), where most of the ordinary grains, potatoes, onions, melons, etc., are grown. The agricultural or southern belt of West Siberia extends from the western border to Lake Baikal, approximating 180,000 square miles, three-fourths of which is good farming land with an alluvial soil (in the extreme west the soil is black earth like that of the Russian wheat belt) well adapted for the cultivation of wheat, oats, rye, and barley, as well as for cattle raising. The agricultural development of Siberia may be gauged by the enormous demand for agricultural implements and machinery, necessitating in 1913 over 600 warehouses and foreign branches for their sale and involving a turnover of about \$5,500,000. It is estimated that 300,000,000 acres, all told, may ultimately be turned into farming lands, of which the Amur and maritime provinces will supply about 69,000,000 acres. The summers in the east, however, are not very favorable for cereal crops on account of excessive moisture. Elsewhere, however, considerable quantities of cereals and pulse are grown, reaching 248,540,000 poods in 1914. Fruit and vines flourish only in a few sheltered localities on the Ussuri River.

Horses, cattle, and sheep are behind agriculture in importance, but stock raising is a growing industry, particularly in West Siberia. In 1911 about 17,500,000 horses and cattle were found in the principal provinces, while in the whole of Siberia the number of sheep and goats in 1913 was 5,195,026. In 1880 no butter was made, but by 1904 there were 2630 factories, while in 1912 these numbered 2294 in the Government of Tomsk alone. The same year the export of butter from Siberia amounted to 77,642 short tons and exceeded in value \$30,900,000. In 1913 the quantity of butter exported reached 4,058,650 poods.

**Manufactures.** Previous to 1890 the manufacturing industries were confined almost entirely to tanning, tallow boiling, distilling, brickmaking, and ore smelting (gold and silver ore treated at Barnaul and Nertchinsk). The building of the Trans-Siberian Railroad gave considerable impetus to manufacturing by making it easier and less costly to import machinery for mills. At the same time the railroad, by enlarging the facilities for the importation of Russian manufactures, injured the household industries, which formerly supplied most of the clothing, furniture, and utensils. Tomsk (pop., 112,000 in 1913) is by far the largest manufacturing centre. Its mills and factories are now supplying porcelain, refined sugar, flour, iron wares, carpets, and other products in considerable variety. Other western towns also are growing in this respect. In the east, in the

Amur Province alone, there were in 1911 no fewer than 789 industrial establishments, with a turnover of \$5,890,142. Together with the Maritime Province it employed 115,000 workmen in 1912. The chief impediments are lack of good workmen and the high cost of fuel.

**Commerce.** Few trade statistics for Siberia are published. The enormous distances between different parts of the country have always hampered both the domestic and the export trade, but this situation, mitigated by the development of steam navigation, has been still further improved by the Trans-Siberian Railroad, so that a great deal of grain is now sent from West to eastern Siberia, and more wheat and live cattle are sent to Russia and other European markets. Wheat, which has been exported from West Siberia to European Russia since 1899, constitutes the major portion of the exports of grain. Butter is exported more profitably than cereals, and is handled by Danish, German, and English firms, whose representatives send it to refrigerators along the railroads. Siberia's egg trade is rapidly growing in importance, while its meat is exported in large quantities, some 30,000 tons annually. The carrying trade of Siberia has reached 74,000,000 poods annually. Its home trade has also grown considerably since 1905—from 60,000,000 to 150,000,000 rubles annually. An enormous amount of tea is still transported by sledge in winter and by the river routes in summer. General manufactures, iron and steel, and sugar (practically all from Russia) are the chief imports. The free-trade policy, long maintained in Siberia, ceased in 1900, when the heavy duties levied in European Russia were imposed at the Siberian frontiers and ports. A short free list includes cereals (eastern Siberia not raising all the grain needed) and agricultural and mining machinery. All Chinese products, excepting tea and spirituous liquors, are on the free list.

**Transportation and Communication.** There were in all 416 steamers in Siberian waterways in 1910. Of these 200 were on the Amur system and 140 on the Yenisei. The Siberian railroad has not yet greatly affected the business of the river routes, excepting in grain transportation.

The Trans-Siberian Railroad, which was begun in 1891 and completed in its main features in 11 years, including a branch across Manchuria to Port Arthur and Dalny, starts from Tcheliabinsk, on the eastern slope of the Urals. Its length to Vladivostok, on the Pacific, is about 4500 miles. The continuous railway route from St. Petersburg to Vladivostok is 5481 miles long. The road cost \$172,525,000. It is giving an impetus to agriculture and all other business enterprises of the country, while its branches north and south (all fed by a great river traffic) open up vast new areas to colonization. This railroad proved of great importance to Russia in the War of the Nations, as the only route by which merchandise could be imported during the parts of the year in which the port of Archangel was closed by ice, the Baltic having been closed by mines and German war vessels. The value of merchandise sent from the United States to Russia by way of Vladivostok and the Trans-Siberian Railway was about \$45,000,000 in 1915. The sea trade is comparatively small. The vessels clearing from Vladivostok, the commercial port of the Russian Far East, carried 1,145,000 tons in 1911. North of this port is Alexandrovsk,

which Russia has turned into a coaling station for its warships. A number of merchant vessels have successfully made their way between European ports and the mouths of the Obi and Yenisei rivers through the Kara Sea and Arctic Ocean, but this route is as yet of slight commercial importance.

In 1912 Siberia had 6245 educational institutions with 344,678 pupils, while its university at Tomsk had 1347 students. The opening of the Peoples' University in 1912 (called the Tomsk House of Science), with free instruction to all, marks an important departure in the higher education of Siberia. The predominant religion is Orthodox Greek. The population in 1912 was 9,577,900. The Russians constitute about two-thirds of the population, composed of free immigrants and their descendants and the exiles and their descendants. The Russian immigration to Siberia was 3,970,000 between 1896 and 1910, while the entire number of immigrants in 1913 was 327,430. Many of these, disheartened by their pioneering experiences, returned to European Russia. Next to the Russians in numerical importance are the Kirghizes, Buriats, and Yakuts.

For government and further details, see RUSSIA.

**Ethnology.** The peoples of Siberia are ethnographically and linguistically very diverse. Apart from the Russians, who number about 61 per cent of the total population, several thousand Poles and about 5000 Germans, besides the Semites and the Aryan gypsies, about 8000 and 5000 respectively, the Siberians are mainly Ural-Altaic in race. The tribes of West Siberia are akin to the Samoyeds (q.v.), who themselves number about 11,000 through the western Finns, while the eastern Siberians belong to the Tungusic group (see TUNGUS), and there is a large population of the so-called Pale-Asiatic stock. The western tribes comprised under the name of Yeniseians include 6000 Woguls, the Ostiaks, of whom there are about 3500, and the Soicts, numbering some 2000. The Tungusic population amounts to 69,600. The Turko-Tatar division of the Ural-Altaic family in Siberia comprises 230,300 Yakuts and 100,000 Tatars proper, while the Mongolic division includes 59,000 Buryats, 30,500 Chinese and Manchus, and 2000 Koreans. The Pale-Asiatic division is represented by 8000 Tchulutchi, 7000 Koriaks and Yukaghirs, 6000 Gilyaks, 4000 Kamchadales, and 1500 Aino. See URAL-ALTAIC.

**History.** The history of Siberia, an episode in that of the Russian Empire, is a history of national expansion—of adventure, exploration, settlement, and development—a process still going on in all its phases. The Russian chronicles mention a Russian expedition to the "land of Siberia" under date of 1483. In the sixteenth century a Tatar khanate was formed in Siberia with the capital, Sibir, on the river Irtysh. These khans carried on negotiations with Ivan the Terrible for the recognition of a Russian protectorate over their khanate, but without results. The conquest of Siberia was the work of the enterprising family of Strogonov, who carried on an active trade in eastern Russia near the Urals and who, favored by liberal concessions from the crown, founded towns and developed the country. In 1579, with the Czar's permission, they sent into West Siberia an expedition of about 800 men, under the command of an outlaw, Vassili, commonly known as Yer-

mak (millstone), a Russian who had joined the Don Cossacks. Yermak defeated the Tatars, captured Isker or Sibir, the capital of Kutehum Khan, and won pardon and honor by giving a new empire to Russia. In the spring of 1582 he sent to Moscow the report of his triumph. Yermak was killed in 1584 but Russia held the country he had won. Tobolsk was built on the site of Sibir in 1587, and many forts, or *ostrogs*, were located at strategic points. The Siberian tribes offered little organized resistance to Russian absorption. Southward there was trouble from the warlike tribes of Central Asia, and this determined the direction of Russian expansion eastward along the line of least resistance. In 1638 the explorers and fur traders had reached the mouth of the Yenisei, in 1637 they had moved forward to the Lena, two years later they were on the shores of the Sea of Okhotsk, and before the close of the century the peninsula of Kamchatka had been brought under Russian authority. In this region there was no organized government; its conquest was the peaceful work of the pioneer, interrupted by attacks from hostile natives. Siberia extended then southward to the Irtysh, the boundary of Mongolia, and to the Amur.

When the Russians under Khabarov reached the Amur in 1651, they came into contact with the Manchu power, which had just conquered China, and the struggle began for the control of the Amur and for Manchuria. The advance on the Amur was due to the energy, foresight, and administrative ability of Khabarov, who successfully withstood the Manchus. In 1689, when Russian interests were in less competent hands, the Treaty of Nerchinsk was made between Russia and China, the first treaty made by the latter Empire with a Western power. By this treaty Russia yielded the middle and lower portions of the river, and the struggle for the Amur was not resumed until the middle of the nineteenth century. During this period the attention of Russia was turned more to the west, whither it had been directed by Peter the Great. In 1847 General Muraviev (q.v.) was appointed Governor-General of eastern Siberia. He obtained authority for establishing a post of the Russian-American Company at the mouth of the Amur, for the formation of an effective military force from the Cossack settlers, and finally in 1853 for the occupation of De Castries Bay on the Gulf of Tartary and of the island of Sakhalin. Still the hostile attitude of the Asiatic Department in St. Petersburg embarrassed Muraviev until the outbreak of the Crimean War gave him his great opportunity. With a view to the adequate defense of Russian interests on the Pacific, he was empowered to conduct negotiations with the Chinese government directly, without reference to St. Petersburg, and to open communication by the Amur between Nerchinsk and the coast and thence with the fortified port of Petropavlovsk in Kamchatka. In May, 1854, he led an expedition down the Shilka and thence down the Amur, which had been so long closed to Russia. On August 29 an English and French squadron of eight vessels with 236 guns arrived off Petropavlovsk and began an attack on September 1. This attack was devoid of results. It was renewed on the 24th, when the allies, after silencing some of the batteries, were repulsed in their land assault with loss of about one-third of their 700 men. Knowing that another attack would be made by

the allies in greater force, Muraviev ordered the abandonment of Petropavlovsk early in 1855 and concentrated his strength about the mouth of the Amur. Empowered as a plenipotentiary to arrange a treaty with China, he concluded in May, 1858, the Convention of Aigun, which made the Amur the boundary between the two countries, the left bank to belong to Russia, the right as far as the Ussuri to China and from the latter river to Korea.

In 1860, by the Treaty of Peking, Russia secured the country between the Ussuri and the sea, and in the same year Vladivostok was founded. In 1872 this was made the chief naval station of Russia on the Pacific, in place of Nikolayevsk at the mouth of the Amur. Early travel in Siberia was by the rivers. Russian progress across the continent was followed by the great Siberian post road, connecting the chain of towns which formed the administrative centres of the provinces. The work of Muraviev, the colonization of the rich country beyond the Ussuri, and the acquisition of an available Pacific seaboard brought out the idea of a great transcontinental railway. In 1878 the government took this up and by 1884 had built a road from Perm to Tiumen. Other local projects followed, and in 1891 the construction of a Trans-Siberian railway was authorized and begun. Russia obtained a foothold in the Liaotung Peninsula through intervention after the war between China and Japan in 1895, and there established the strong naval station of Port Arthur and the free port of Dalny. This was connected by the Manchurian Railway, built under treaty between Russia and China, with the Siberian Railway in Trans-Baikalia and with Vladivostok. The history of Siberia during the first five years of the twentieth century is largely connected with the Russian advance in Manchuria and the ensuing Russo-Japanese War (q.v.). The loss of Port Arthur as a result of the war made Vladivostok once more the chief Siberian port.

Until 1900 convicts were exiled to Siberia in great numbers and many barbarities and abuses arose from the system, which was largely mitigated by a ukase of the Czar which substituted imprisonment for exile except in the case of political offenders, for whom transportation was retained, though not necessarily to Siberia. Large numbers of political prisoners were transported during the troubled years 1905-06. During the Great War which began in 1914 the exile system was abolished. See WAR IN EUROPE; YAKUTS.

**SIBERIAN PLAGUE.** See ANTHRAX.

**SIB'LEY, HENRY HASTINGS** (1811-91). An American pioneer, born in Detroit, Mich. He was an infant when Detroit was captured by the British and his family fled to Ohio. About 1828 he lived awhile at Mackinac and Fort Snelling as a fur trader for the American Fur Company. From 1849 to 1853 he was delegate to Congress from the Territory of Minnesota, the organization of which was largely due to his efforts. In 1857 he was a member of the Constitutional Convention and the next year became first Governor of the State. In 1862 he commanded the troops gathered for the defense of the frontier against the Indians and at Wood Lake won a victory. For this President Lincoln commissioned him a brigadier general of volunteers. The next year he defeated the Sioux in three battles. In 1865 he was brevetted major general, and in 1866 he was appointed one of the commission to negotiate treaties with hostile tribes. Consult Williams, "Henry Hastings Sibley: A Memoir," in the *Collections of the Minnesota Historical Society*, vol. vi (St. Paul, 1894).

**SIBLEY, HENRY HOPKINS** (1816-86). An American soldier, born in Nachitoches, La. He graduated in 1838 at the United States Military Academy and took part in the Seminole War. He fought through the Mexican War and served in the Utah and Navaho expeditions. He was promoted to be major, but resigned in order to enter the Confederate army, in which he received a commission as brigadier general. Ap-

pointed to command the Department of Mexico, he raised a brigade and in 1862 defeated the forces under Colonel Canby at Valverde, N. Mex. In 1869-74 he was in the service of the Khedive of Egypt and constructed river and coast defenses. He invented a tent, known by his name.

**SIBLEY, HIRAM** (1807-88). An American financier. He was born at North Adams, Mass., and was a millwright and machinist for a time at Lima, N. Y. When telegraphy came into practical use he, in association with Ezra Cornell (q.v.), consolidated 20 smaller telegraph corporations into the Western Union Telegraph Company, of which he was president for 17 years. In 1861 he was the moving spirit in the construction of a transcontinental telegraph line for the promotion of which Congress granted for 10 years an annual subsidy of \$40,000. He next projected a telegraph route to Europe by way of Bering Strait and Siberia, but, though wires were strung in Siberia and Alaska, he abandoned the enterprise on the completion of the Atlantic cable. After 1869 he devoted his attention to railroad building and land investments while resident in Rochester, N. Y. He gave \$100,000 to the University of Rochester for a library building and at Cornell University founded the Sibley College of Mechanical Engineering.

**SIBONGA, sê-bông'â**. A town of Cebû, Philippines, situated on the east coast, 26 miles southwest of Cebû. Pop., 1903, 25,848.

**SIBTHORP, JOHN** (1758-96). An English botanist, born in Oxford, where he graduated at Lincoln College. He studied also at Edinburgh, at Montpellier, at Göttingen, and at Vienna. Although he succeeded his father as Sherardian professor of botany at Oxford in 1783, he spent most of his time in botanical exploration on the Continent, especially in Greece. His great work, *Flora Oroniensis* (1794), shows him to have been an able botanist. *Flora Græca* was published in 10 volumes (1806-40).

**SIBYL** (Lat. *sibylla*, from Gk. *σῖβυλλα*, sibyl). The name in Greek and Roman legend of women inspired by Apollo with prophetic power. The early Greek authorities mention but one, probably the Erythræan Herophile. Later poets or local legends increased the number, and finally we hear of 10, the Erythræan, the Samian, the Trojan or Hellespontine, the Phrygian, the Cimmerian, the Delphian, the Cumæan, the Libyan, the Babylonian, and the Tiburtine. Certain verses of vague import were attributed to them. In Roman religious history these oracles played an important part. According to one story (see, e.g., Aulus Gellius, *Noctes Atticæ*, i, 19) an aged woman (the Cumæan sibyl, commonly identified with the Erythræan) appeared before King Tarquin the Proud and offered him nine books at a high price. When he refused her demand she destroyed three books and then offered the remaining six at the original price; again refused, she destroyed three more. The King, deeply moved, bought the remaining three at the price demanded for the nine. These were placed in the cella of the temple of Jupiter on the Capitol and there remained until they perished in the burning of the temple (83 B.C.). A special commission made a new collection, which consisted of about 1000 verses. Later Augustus caused the collection to be carefully sifted, as much spurious material was thought to be present, and had the whole deposited in the temple of Apollo on the Palatine. Shortly after 400 A.D. the Sibylline Verses were burned

by Stilicho. For the care and consultation of the books were appointed at first the *Duoviri sacris faciundis*, whose number was raised in 367 B.C. to 10, five patricians and five plebeians, and by Sulla to 15. The consultation could occur only by vote of the senate, and the result was reported to that body. The consultation seems to have been ordered when prodigies showed special need of conciliating the gods. For Christian Sibyllists, see SIBYLLINE ORACLES.

**Bibliography.** E. Maass, *De Sibyllarum Indicibus* (Greifswald, 1879); J. Marquardt, *Römische Staatsverwaltung*, vol. iii (2d ed., Leipzig, 1885); H. Diels, *Sibyllinische Blätter* (Berlin, 1890); K. Schulters, *Die Sibyllinischen Bücher in Rom* (Hamburg, 1895); W. W. Fowler, *Roman Festivals* (London, 1899); Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., ib., 1912); the article "Sibylla," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914); also the authorities under ROMAN RELIGION.

**SIBYL, GROTO OF THE.** 1. A cavern near Lake Avernus, a hewn passage, 110 yards long, ventilated from above by a shaft. 2. A cavern at Cumæ supposed to be the grotto described by Vergil in the *Æneid*. It has many openings and subterranean passages, most of which are blocked up. 3. A cavern at Marsala, the ancient Lilybæum, in Sicily. It contains a spring by means of whose waters the sibyl was supposed to give forth her oracles.

**SIBYLLINE** (sib'i-lin or -lin) ORACLES. A collection of oracles, written in Greek hexameters, claiming to be the work of an inspired prophetess, who represents herself as having come from Babylon to Hellas or as a relative of Egyptian Isis (v, 52), but denies that she is identical with the Erythræan sibyl or with the daughter of Circe, i.e., the Cumæan sibyl. There is indeed a noticeable difference between these oracles and the fragment of 70 verses from the Roman Sibylline Books preserved by Phlegon, a contemporary of Hadrian (*De Rebus Mirabilibus*, x). But a number of quotations from the Erythræan sibyl by pagan writers which are also found in this collection, such as the lines concerning the alluvial deposits of Pyramus cited by Strabo and also in *Or. Sib.*, iv, 95 ff., show how naturally the suspicion arose. Hermas, Theophilus of Antioch, Clement of Alexandria, Tertullian, Origen, Lactantius, and Augustine are familiar with Sibylline Books containing prophecies of special value for Christians. In the Middle Ages they enjoyed a high authority; the testimony of David was in more than one way supplemented by that of the sibyl. Eight books were published by Xystus Betuleius (Basel, 1545), with a Latin translation by Sebastian Castalio (ib., 1555), by Johannes Opsopæus (Paris, 1599), by Servatius Gallæus (Amsterdam, 1689), and by Andreas Gallandus (in *Bibliotheca Veterum Patrum*, Venice, 1765). Book xiv was published from an Ambrosian codex by Angelus Mai (Milan, 1817), and books xi-xiv from two Vatican manuscripts by him in 1828. In two manuscripts viii, 1-9 appears as book xv, whence it has been inferred that the original collection had 15 books. Books ix and x have not been found. The editions of C. Alexandre (Paris, 1841-56), J. H. Friedlieb (Leipzig, 1852), Aloysius Rzach (Vienna, 1891), and Johannes Geffcken (Leipzig, 1902) contain all the

material now known. As early as 1592 Faustus Socinus questioned the existence of the sibyls, the integrity of the text, and the high age of the oracles. Opsopoeus regarded a number of passages as of Christian origin. Isaac Casaubon (1614), David Blondel (1649), Anton van Dale (1683), Richard Simon (1685), B. de Fontenelle (1687), J. A. Fabricius (1705), and J. Clericus (1707) assigned the oracles to Christian authors. Hugo Grotius (1644) suggested Jewish authorship for the original oracles, and Isaac Vossius (1679) claimed Jewish authorship and recognition in the synagogue for all of them. Tobias Wagner (1664) and others threw out the suggestion that real pagan oracles were interspersed in the present collection. This was taken up again by Bleek in 1819-20. Thus the main positions of scholarship in the last century were already indicated by the researches of the seventeenth century. It is becoming widely recognized that pagan oracles of the Hellenistic period, ascribed to the Babylonian, Persian, Egyptian, Libyan, Phrygian, Erythraean, and other sibyls, were incorporated in the Judæan, that the Jewish Sibylline Oracles have suffered from Christian interpolations, and that some books are distinctly Christian. Book iii is undoubtedly the oldest. It is supposed to contain large excerpts from the Babylonian and the Erythraean sibyls, sections written by a Jewish author in the middle of the second century B.C., others from the first century B.C., and some Christian interpolations a century later. To this book belongs also a section found in Theophilus' Epistle to Autolyceus. Book iv is also held to be Jewish, coming from the year 80 A.D., and likewise Book v, partly written about the same time, partly c.120 A.D. Book vi is clearly Christian, and book vii apparently is Gnostic. Book viii is divided into two distinct parts: 1-216 may well have been originally Jewish; 217 ff. are manifestly Christian, containing the famous acrostic. Books i and ii, once a unit, contain a long abstract from the Jewish work ascribed to Phocylides, and also other parts that seem to be of Jewish origin, but have been recast by a Christian of the third century. As to books xi-xiv there is as yet no consensus of opinion. They are of great interest because they reflect the manner in which the Roman emperors were looked upon by the common people of the provinces, and perhaps all the more so because the allusions do not correspond with the judgments upon these men we should expect from Jews and Christians respectively. The late date makes a Jewish origin and a transfer to Christian hands difficult and yet not impossible.

**Bibliography.** There is an English translation of the whole work by Milton S. Terry, *Sibylline Oracles* (2d ed., New York, 1890), and of books iii-v by H. C. O. Lanchester, in R. F. Charles, *Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913); the more important Jewish sections are given by F. Blass in German, in E. Kautzsch, *Apokryphen und Pseudepigraphen des alten Testaments* (Leipzig, 1900); and of the Christian parts by J. Geffcken, in A. Hennecke, *Neutestamentliche Apokryphen* (Tübingen, 1904). For the older literature, consult J. A. Fabricius, *Bibliotheca Græca* (4th ed., Hamburg, 1790); for the later, C. Alexandre, *Oracula Sibyllina* (Paris, 1841-56); Emil Schürer, *Geschichte des jüdischen Volkes im Zeitalter Jesu Christi* (4th ed., Leip-

zig, 1901-11; Eng. trans. of 1st ed., New York, 1896); J. Geffcken, *Komposition und Entstehungszeit der Oracula Sibyllina* (ib., 1902); Stephanus Szekely, *Bibliotheca Apocrypha* (Fribourg, 1913).

**SIC'AN'L.** See SICILY, *History*.

**SICARD**, sik'ard, MONTGOMERY (1836-1900). An American naval officer. He was born in New York City, graduated in 1855 at the United States Naval Academy, and served through the Civil War. He participated in the bombardment and passage of Forts Jackson and St. Philip, and the Chalmette batteries, and in the passage of the batteries at Vicksburg. When later in the South Atlantic blockading squadron he took part in the attacks on Fort Fisher (1864-65) and in the bombardment of Fort Anderson (1865). In 1865-69 he was stationed at the Naval Academy, in 1869-71 was in the Pacific fleet, in 1870 was promoted to be commander, and in 1870-78 was on ordnance duty. During the early years of rebuilding the navy (1881-90) he was chief of the Bureau of Naval Ordnance and rendered great service. He was promoted to be captain in 1881 and rear admiral in 1897. For a time he was commandant of the New York Navy Yard and later (1896-98) in command of the North Atlantic squadron, but later was relieved on account of ill health and appointed president of the strategy board. He was retired in 1898.

**SICCARD VON SICCARDSBURG**, zé'kärt fön zé'kärts-bürk, AUGUST VON (1813-68). An Austrian architect, born in Vienna. He became intimately associated with Eduard van der Null (q.v.) and through their coöperation the entire tone of modern Viennese architecture was elevated. The magnificent New Opera House (1860-66) was the principal product of their joint activity.

**SICELL.** See SICILY, *History*.

**SICHEL**, sik'el, EDITH HELEN (1862-1914). An English author, sister of Walter Sichel. She was born in London and was educated at home by private teachers. An apprenticeship as a writer for magazines of the better sort led to the more ambitious undertakings: *The Two Salons* (1895); *The Household of the Lafayettes* (1897); *Women and Men of the French Renaissance* (1901); *Catherine de Medici* (1905); *Life and Letters of Alfred Anger* (1906); *The Later Years of Catherine de Medici* (1908); *Michel de Montaigne* (1911); *The Renaissance* (1914).

**SICHEL**, WALTER (1855- ). An English biographer and lawyer, of German descent, born in London and educated at Harrow and at Balliol College, Oxford. He studied law and was called to the bar in 1879. His writings, in addition to two law books and contributions to the reviews, include: *The Squires* [by Aston Ryot (2)], an *Aristophanic Burlesque* (1885); *Bolingbroke* (1902); *Disraeli: A Study in Personality and Ideas* (1904); *The Life of Lord Beaconsfield* (1904); *Emma, Lady Hamilton* (new ed., 1905); *The Life of Richard Brinsley Sheridan* (2 vols., 1909); *Sterne: A Study* (1910). In 1910 the *Glenburnie Journals* were edited by Sichel, with an introduction. For his sister, see SICHEL, EDITH.

**SICILIANA**, sé'ché-lyá'ná (It., Sicilian). In music, a name given to a slow dance, in six-eight or twelve-eight time, peculiar to the peasants of Sicily. It is danced by one couple at a time, the man and the woman alternately choosing new partners, withdrawing in turn. An

excellent example of a Siciliana is in Mozart's *Nozze de Figaro*.

**SICILIAN VESPERS.** The name given to the massacre of the French in Sicily, which began at Palermo on the day after Easter (March 30), 1282, while the bells were ringing for the vesper service. Charles of Anjou (q.v.) had deprived the Hohenstaufen dynasty of Naples and Sicily and had parceled out these kingdoms into domains for his French followers, but his cruelty towards the adherents of the dispossessed, his oppressive taxation, and the brutality of his followers excited among the Sicilians fierce resentment. Authorities differ as to whether the uprising was spontaneous. It would seem that the intrigues of Pedro III of Aragon had something to do with bringing it about, but the story goes that on the evening of Easter Monday the inhabitants of Palermo, enraged at outrages, put to the sword their oppressors, sparing none, not even those Italians and Sicilians who had married Frenchmen. This example was followed later at Messina and other towns, and the massacre soon became general. Charles of Anjou made a determined attempt to reconquer the island, but the Sicilians summoned to their aid Pedro III of Aragon, who had himself crowned King of Sicily and destroyed the fleet dispatched by Charles for the reduction of Messina. The Angevins thus lost control of Sicily. Consult: Michele Amari, *Racconto popolare del Vespro Siciliano* (Rome, 1882); id., *La guerra del Vespro Siciliano* (9th ed., Milan, 1886; Eng. trans., 3 vols., London, 1850); H. D. Sedgwick, *Italy in the Nineteenth Century*, vol. ii (Boston, 1912).

**SICILIES, KINGDOM OF THE TWO.** See Two SICILIES, KINGDOM OF THE.

✓ **SICILY**, sis'i-lī (It., Lat. *Sicilia*, Gk. *Σικελία*, *Sikelia*, from Lat. *Siculus*, Gk. *Σικελός*, *Sikelos*, Sicilian). The largest island in the Mediterranean Sea, forming part of the Kingdom of Italy. It is southwest of the Italian Peninsula, from which it is separated by the narrow Strait of Messina (Map: Italy, D, E 6). It is triangular, and has an area of 9935 square miles.

**Physical Features.** The island, like the mainland of Italy, is traversed throughout its entire length by a chain of mountains which may be looked upon as a continuation of the Apennines, and like them the steepest slope faces the Tyrrhenian depression to the north (q.v.). The eastern part of the chain, running westerly from Capo del Faro, is called the Peloric Range, which in Monte Tre Fontane attains the height of 4508 feet. The western and much the longer part is called the Madonian Range, which, in the Pizzo dell' Antenna, rises to an elevation of 6478 feet. In the west the chain breaks up into irregular and often detached masses, and numerous minor spurs extend to the south. About the centre of the chain a range branches off through the heart of the island to the southeast, at first wild and rugged, but afterward smoothing down into table-lands, which slope gradually to the sea. Mount Etna (q.v.), situated near the east shore, is the highest point of the island, rising to an elevation of about 10,750 feet. The north and east shores offer the best harbors. The rivers are mostly short and rapid, and some of them are dry in summer. The principal are the Alcantara, Simeto, Salso, Platani, and Belice. There are few lakes on the island, but many mineral springs. The sulphur springs were famous in ancient times.

**Climate.** The climate is typically Mediterranean in character. The temperature is moderate and very seldom falls below the freezing point. The island, however, is visited by the sirocco, with its intolerable dry heat. Much of the lower sections are subject to malaria, but the climate is on the whole salubrious. The summers are almost rainless, the aridity aggravated by the fact that the interior is almost deforested, so that there is nothing to retain the moisture of winter and spring rains. The steep northern side of the mountains is composed of Triassic formations. The western and southern parts of the island are overlaid with later stratified rocks, and the southern plateau is mainly Tertiary. Basaltic and other volcanic intrusions occur over large areas, especially in the southeast range, and the immense sulphur deposits as well as the active crater of Mount Etna are further evidences of volcanic nature.

**Industries.** Sicily is the principal source of the world's supply of sulphur, the output greatly increasing since the formation of the Anglo-Italian syndicate in 1896. Other minerals are rock salt and asphalt. Agriculture is still the main industry, although the island is no longer the granary of Italy, as its present output of cereals is barely sufficient for domestic demands. The growing of cereals is confined almost exclusively to the larger estates, which are found mostly in the interior and along the southern coast. In smaller holdings the land is devoted principally to the cultivation of grapes, almonds, olives, oranges, lemons, beans, sumac, etc. Agricultural methods are primitive. The fisheries (tunny, sardine, coral, and sponge) are extensive, deep-sea fisheries alone giving employment to over 20,000 persons. The making of wine and olive oil, the canning of fruits and vegetables, and the preparation of citric acid are extensively carried on. There are also produced some glassware, metal ware, matches, etc., in the larger cities. Sicily exports sulphur, fruits, and vegetables, sumac, salt, wine, oil, and fish, and imports mainly grain, coal, and iron. Almost the entire trade is sea-borne. At the three principal ports—Palermo, Catania, and Messina—there were entered and cleared, in 1912, 20,989 vessels, of 16,352,860 tons net. The length of railway in operation at the end of 1913 was 971 miles.

**Administration, etc.** Sicily forms, together with the Lipari and Ægadian groups and a few other islands, a compartimento of the Kingdom of Italy and is divided into the seven provinces of Messina, Catania, Syracuse, Caltanissetta, Palermo, Girgenti, and Trapani. The elementary schools are inadequate. Secondary education is better provided for, and there are universities at Palermo, Messina, and Catania. Pop., 1901, 3,529,799; 1911, 3,672,258. Palermo is the capital. Communal population of the larger cities in 1911: Palermo, 341,088; Catania, 210,703; Messina, 126,557; Marsala, 65,451; Trapani, 59,593; Modica, 55,924. Emigration is very large; emigrants numbered 96,713 in 1910 and 50,789 in 1911. The condition of large numbers of the laboring class, especially those engaged in the sulphur industry, is deplorable. The secret organization known as the Mafia (q.v.) frequently interferes with the execution of the law.

**History.** Sicily was inhabited at the dawn of history by a people called Siculi or Sicani, who, according to tradition, crossed over into the island from the southern extremity of Italy.

They were members of the great Latino-Italian family. The recorded history of Sicily begins with the establishment of Greek and Phœnician colonies. The earliest Greek colony, Naxos, was founded 735 B.C.; the latest, Agrigentum, about 580 B.C. Between these dates numerous important colonies were established, including Syracuse, Leontini, Catana, Megara, Hyblæa, Gela, Zancle (the later Messina), Acræ, Himera, Mylæ, Casmenæ, Selinus, and Camarina. These cities attained great commercial prosperity. Their governments were at first oligarchies, but afterward democracies or tyrannies; but it is not till the period of the despots that we have detailed accounts. Agrigentum and Gela early acquired prominence; the former, under the rule of Phalaris (q.v.), became for a short time probably the most powerful state in Sicily, and the latter, under a succession of able tyrants, Cleander, Hippocrates, and Gelon (q.v.), forced into subjection most of the other Greek cities. Gelon, however, transferred his government to Syracuse (one of his conquests), which now became the principal Greek city of Sicily—a dignity it retained throughout ancient times. Meanwhile the Carthaginians had obtained possession of the Phœnician settlements in Sicily. (See CARTHAGE.) The Carthaginians first appeared in the island in 536 B.C., but the steady growth of the Greek cities in wealth and power long confined them to the northwestern part, where their principal colonies were Panormus, Motya, and Solois. In the great battle of Himera in 480 B.C. the Carthaginian army was utterly routed by Gelon, and its leader, Hamilcar, was slain. The Gelonian dynasty at Syracuse fell in 466 B.C. For 50 years Sicily had peace. In 410 B.C., however, war between Carthaginians and Greeks for the possession of the island was renewed. The successes of the former were great. Selinus, Himera, Agrigentum, Gela, and Camarina fell into their hands in less than five years, and it was not till Syracuse had a new tyrant, the famous Dionysius the Elder (q.v.), that fortune began to change. Even he, however, could not wrest from the Carthaginians what they had already won, and after the war of 383 B.C. a peace was concluded which left Dionysius in possession of the eastern and the Carthaginians of the western half of the island. Timoleon won a splendid victory over the Carthaginian generals, Hasdrubal and Hamilcar, at the river Crimisus about 340 B.C. Once more Greek influence was in the ascendant, but the rule of the bold and ambitious tyrant Agathocles (317–289 B.C.) proved in the main disastrous to Greek supremacy. After his death Syracuse lost her hold over many of the Greek cities, which established a weak and perilous independence, that only rendered the preponderance of the Carthaginians more certain. Finally Pyrrhus (q.v.), King of Epirus, invited by Sicily to help his countrymen, landed in the island in 278 B.C. The brilliant adventurer for a time swept everything before him. Panormus, Ercte, and Eryx were captured, and, though he failed to make himself master of Lilybæum, he might have forced the Carthaginians to surrender if he had not been thwarted in his designs by discords and jealousies of the people. As it was, Pyrrhus left Sicily in about two years, and in all likelihood the island would have become a Carthaginian possession had not a new power, Rome, appeared to engage the Carthaginians. In 241 B.C., at the close of the

First Punic War, Carthaginian Sicily was given up to the Romans, and in 210 B.C., in the course of the Second Punic War, the whole island became a Roman province—the first province Rome ever held. In 135–132 B.C. and again in 103–100 B.C. it was the scene of formidable slave insurrections. Its fertility and the wealth of its citizens and landholders were powerful temptations to greedy and unscrupulous governors.

In 440 A.D. Sicily was conquered by the Vandals under Genseric, who were dispossessed half a century later by the Ostrogoths, in whose hands it remained till 535 A.D., when Belisarius conquered it and annexed it to the Byzantine Empire. In 827–878 the Saracens made themselves masters of the island, which flourished under their rule. In 1038 the Eastern Empire began the reconquest of the island and had partial success. In 1060 the Normans, under Robert Guiscard and his brother Roger, engaged in the conquest of Sicily, which was completed in 1090, a few years after the death of Robert. In 1127 Roger II (q.v.), Count of Sicily, was recognized as Duke of Apulia and Calabria, and in 1130 he assumed the title of King of Sicily.

In 1194 the Norman rule was succeeded by that of the house of Hohenstaufen (q.v.), whose dynasty was overthrown by Charles of Anjou in 1266. In 1282, after the Sicilian Vespers (q.v.), Sicily became independent and chose for its King Pedro III of Aragon, who was connected by marriage with the house of Hohenstaufen. In 1296 it was separated from Aragon and for more than a century was ruled by a branch of the Aragonese dynasty, when it was reunited with that kingdom. Ferdinand the Catholic made himself master of the Kingdom of Naples in 1503, and the Spanish crown retained both countries until the War of the Spanish Succession. By the Treaty of Utrecht (1713) Sicily was separated from Naples and handed over to Victor Amadeus, Duke of Savoy, who ceded it to Austria seven years later, receiving in exchange the island of Sardinia. In 1734–35 Don Carlos established the Spanish Bourbon dynasty in Naples and Sicily (the Two Sicilies), and down to 1860 Sicily was ruled by Bourbon kings. (See TWO SICILIES, KINGDOM OF THE.) In 1860 Garibaldi's invasion (see GARIBALDI; ITALY) resulted in the annexation of Sicily to the dominions of Victor Emmanuel, which in 1861 became the Kingdom of Italy.

vius, *Siciliana: Sketches of Naples and Sicily in the Nineteenth Century* (Eng. trans. by G. W. Hamilton, New York, 1914); F. M. Crawford, *Southern Italy and Sicily, and Rules of the South* (new ed., 2 vols., ib., 1914); G. Bruccoleri, *La Sicilia di oggi* (Rome, 1914).

**SICKEL**, zik'el, THEODOR, KNIGHT VON (1826-1908). A German historian, born at Aken and educated at Halle, Berlin, and Paris. He made researches in the archives of Milan and Vienna for the French government, and became professor of history in Vienna in 1857. He was also director of the Institute for Austrian History at Vienna, counselor in 1876, director of the Austrian Institute at Rome, and a member of the staff of the *Monumenta Germaniae Historica*. Among his works are: *Monumenta Graphica Medii Aevi ex Archivis et Bibliothecis Imperii Austriaci Coelesta* (1859-69); *Beiträge zur Diplomatik* (1861-82); *Zur Geschichte des Konzils von Trient* (1872); *Kaiserurkunden in Abbildungen* (1881); *Das Privilegium Ottos I. für die römische Kirche* (1883); *Römische Berichte* (1895-1901).

**SICK HEADACHE**, See MIGRAINE.

**SICKINGEN**, zik'ing-en, FRANZ VON (1481-1523). A celebrated German knight, born near Kreuznach. Very early in life he began his military career and speedily became recognized as a champion of the oppressed. He participated in the War of the Swabian League against Ulrich of Württemberg, and when Stuttgart was taken in 1519 he protected the great scholar Reuchlin. Through the influence of Ulrich von Hutten, whose protector he was, Sickingen became an ardent adherent of Luther and sought to found a league of the lesser nobility and the cities to reorganize religious and political affairs in Germany. In 1522 he began war against the Archbishop of Treves, but failed in his attack on the city. He was besieged in his own castle and mortally wounded in May, 1523, dying five days later. Sickingen has become a favorite figure in German legend and literature and is one of the chief characters in Goethe's *Götz von Berlichingen* and in Hauff's *Lichtenstein*. Consult Ulmann, *Franz von Sickingen* (Leipzig, 1872).

**SICKLES**, sik'lz, DANIEL EDGAR (1825-1914). An American soldier and politician, born in New York City. He was educated at the New York University, studied law, and was admitted to practice in 1846. In the following years he sat as a Tammany Democrat in the State Assembly. In 1853 he was appointed corporation counsel of New York City and was Secretary of Legation at London (1853-55), when he returned to the United States and was elected to the New York State Senate (1856-57) and became a Democratic member of Congress (1857-61). During this period he shot and killed Philip Barton Key, United States District Attorney for the District of Columbia, for adultery with his wife, but was acquitted after a short sensational trial. At the outbreak of the Civil War he raised the Excelsior (New York) Brigade, becoming colonel of the Seventieth New York Volunteers. He served as brigadier general of volunteers (1861) and major general (1862). He commanded a brigade in McClellan's Peninsular campaign and at Antietam, had a division at Fredericksburg, and was in command of the Third Army Corps later. On the second day at Gettysburg (q.v.) his corps sustained the brunt of the Confederate attack, on the Federal left,

and Sickles himself lost a leg. He continued in the service, was commander of the Department of the Carolinas in 1866-67, brevetted brigadier general and major general in the regular army for services at Fredericksburg and Gettysburg, and for a time was colonel of the Forty-second Infantry. On April 14, 1869, he was retired with the full rank of major general. He was Minister to Spain from 1869 until 1873 and presented the demands of the United States for reparation for the execution of the captain and crew of the *Virginius*. (See VIRGINIUS MASSACRE.) Sickles was again elected to Congress as a Democrat in 1892 and for several years was President of the New York State Board of Civil Service Commissioners. His last years were clouded by financial difficulties and sickness.

**SICOTTE**, sê-kôt', LOUIS VICTOR (1812-89). A Canadian statesman, born at St. Famille, Province of Quebec. Called to the bar in 1838, he removed to St. Hyacinthe, was soon recognized as one of the leaders of the bar of Lower Canada, and in 1852 was elected Liberal member, for St. Hyacinthe County, of the Canada Legislative Assembly, of which he was Speaker (1854-57). In the Macdonald-Cartier ministry (1857-58) he was Commissioner of Crown Lands. This was a time of political reconstruction, when advanced Liberals were separating themselves from the moderate members of the party. Mr. (afterward Sir) John A. Macdonald, the virtual head of the ministry, was at the same time building up a new Conservative party by eliminating reactionary Tories and attracting moderate Liberals. Sicotte, who belonged to the latter group, refused to coöperate with George Brown in forming a ministry and joined the Cartier-Macdonald cabinet, known as the Short administration, as Minister of Public Works (1858). Resigning from office the same year, he succeeded A. A. Dorion as leader of the Lower Canada Liberal Opposition and formed an alliance with John Sandfield Macdonald (q.v.), the leader of the moderate Liberals of Upper Canada. In conjunction with Macdonald he formed the Macdonald-Sicotte administration (1862-63), in which Sicotte was Attorney-General for Lower Canada. Before long, dissensions arose from the attempt to strengthen the ministry by the admission of advanced Liberals from Lower Canada. Refusing to consent to this, Sicotte, with his Lower Canadian colleagues, withdrew. From 1863 to his retirement in 1887 he was a judge of the Superior Court of Lower Canada. Consult J. C. Dent, *The Last Forty Years* (Toronto, 1881).

**SICYON**, sîs'î-ôn (Lat., from Gk. Σικυών, *Sikyôn*, Σικυών, *Sikyôn*). The principal city of a small but fertile state of ancient Greece, Sicyonia, in northern Peloponnesus. The Corinthian Gulf lay to the north, Achaia to the west, Phlius to the south, and Corinth to the east. Between the rivers Asopus and Ilissos, on a triangular plateau, was situated, in later days, Sicyon, about 2 miles south of the Corinthian Gulf and 10 northwest of Corinth. The city was situated at first at the foot of the plateau, but it was removed to the plateau by Demetrius Poliorcetes in 303 B.C. Even in the legends a connection appears between Sicyon and Argos, particularly in the story of Adrastus (q.v.). The Dorian invaders occupied Sicyon, but in peaceable fashion, according to tradition, and the original population formed a

fourth tribe along with the three Dorian tribes. The rule of the Dorian nobles was overthrown by Andreas, or Orthagoras, a member of a non-Dorian family, who about 665 B.C. made himself tyrant—a position held by his house for about 100 years. Under Clisthenes, early in the sixth century, Sicyon reached a high degree of prosperity and warlike fame. Later, Sicyon regularly appears as a dependency of Sparta, until the rise of Thebes. After its rebuilding by Demetrius it again fell under the rule of tyrants, but was finally freed and brought into the Achæan League (see *ACHÆA*) by Aratus (q.v.) (251 B.C.). After the destruction of Corinth by the Romans the Sicyonians for a time had charge of the Isthmian games. In later times Sicyon seems to have been an insignificant place. On its site is the modern village Vasilikó. There are still considerable remains of the Roman period and also a Greek theatre, which was excavated by the American School at Athens. The ancient city was famous from early times for its bronze casting and especially for its painting. For the American excavations, consult: *American Journal of Archaeology*, vols. v, viii, xx (New York, 1889, 1893, 1905). Consult also: Leake, *Travels in the Morea*, vol. ii (London, 1830); E. Curtius, *Peloponnesus*, vol. ii (Gotha, 1851); and the article "Sikyon," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

**SICYON, CLISTHENES OF.** See **CLISTHENES OF SICYON**.

**SICYON, DÆDALUS OF.** See **DÆDALUS OF SICYON**.

**SIDA** (Neo-Lat., from Gk. *σίδη*, *sidē*, pomegranate, water lily). A large, widely distributed genus of annual and perennial herbs and shrubs of the family Malvaceæ, mostly natives of warm climates and generally rich in mucilage. Some of the species have strong pliable fibres, which are employed for cordage and for textile purposes. One of the most valuable of these is *Sida rhombifolia*, a perennial tropical shrub also found in Australia and the United States. It is also said to be cultivated as a forage plant. *Sida tiliaefolia*—better known as *Abutilon theophrasti*—is an annual long cultivated in China for its fiber, which is used like that of hemp. In parts of the United States it is a common weed known as velvetleaf.

**SIDD EL BAHR KALESI**, bū'h'r kā-lā'sé. A fortress in European Turkey on the Gallipoli Peninsula at the Ægean end of the Dardanelles. This fortress came into great prominence in the Great War which broke out in 1914. It was unsuccessfully attacked by land and sea by a British and French expeditionary force (1914-15). The allies after a disastrous campaign were compelled to retire from the peninsula (January, 1916). See **WAR IN EUROPE**.

**SIDDHARTHA**, sid-härt'hā. See **GAUTAMA BUDDHA**.

**SID'DONS, MRS. SARAH** (1755-1831). A celebrated English actress. She was the daughter of Roger Kemble (q.v.) and was born at Brecon in Wales. As a child she had the family aptness for acting and in youth played as a member of her father's company in small provincial towns. She married William Siddons, an actor, in 1773. She soon attracted such attention that Garrick heard her praises in London and offered her an engagement at the Drury Lane Theatre, where, Dec. 29, 1775, she made her first appearance, acting Portia. Her beauty and fine

person pleased, but as an actress she made no great impression and did not obtain a reengagement. But Mrs. Siddons returned to London in 1782 to enjoy a career of triumph as indisputably the greatest actress of her time, having spent the intervening years in provincial cities. As Isabella in *The Fatal Marriage*, she reappeared at Drury Lane Oct. 10, 1782. In 1784 her popularity was temporarily obscured by a charge of pecuniary meanness towards certain fellow performers; but with this trivial exception her efforts were a series of successes till on June 29, 1812, in her great character of Lady Macbeth, she took leave of the public. Belvidera, Queen Katharine, Volumnia in *Coriolanus*, which she played with her brother, John Philip Kemble (q.v.), were a few of the many parts in which she captivated audiences. Mrs. Siddons is said to have been strictly a stage genius, but not of high intelligence. In the practice of her art it was power of manner and personality which made her irresistible. As a tragic actress she has probably never been equaled in Great Britain. Her picture as the "Tragic Muse" by Sir Joshua Reynolds is famous.

**Bibliography.** James Boaden, *Life of Mrs. Siddons* (2 vols., 2d ed., London, 1831); Thomas Campbell, *Life of Mrs. Siddons* (2 vols., ib., 1834); P. Fitzgerald, *Account of the Kemble Family* (2 vols., ib., 1871); H. B. Baker, *Our Old Actors* (ib., 1881); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886); John Doran, *Annals of the Stage* (ed. Lowe, London, 1888).

**SIDE CAR.** An accommodation for a single passenger additional to the driver or operator of a motor cycle (q.v.), located at the side of such operator, a little behind him and on a lower level. The seating is inclosed in a sheet-metal body, often having suggestions of boat or stream lines, and is borne and attached to the frame of the motor cycle proper by a bar frame which is bolted in place. Its side location and its weight necessitate a third wheel, usually smaller than the motor-cycle wheels, and road jars are mitigated by springs. When the side car is removed, the normal motor cycle reappears.

**SIDE OATS.** See **OAT GRASS**.

**SIDEREAL** (sī-dě-rē-al) **CLOCK** (from Lat. *sidereus*, relating to a star, from *sidus*, constellation, star). A clock regulated to indicate sidereal time. (See **DAY**.) The sidereal clock is a most important aid to the practical astronomer and is one of the indispensable instruments of an observatory. See **CLOCK**.

**SID'ERITE** (Lat. *sideritis*, loadstone, from Gk. *σίδηρις*, *sīdēritēs*, relating to iron, from *σίδηρος*, *sīdēros*, iron). A mineral iron carbonate crystallized in the hexagonal system. It has a vitreous lustre and in color is mostly grayish yellow or brown, ranging from pale buff to almost black. It occurs in gneiss, mica, and clay slates and in other rock strata and also frequently with metallic ores. The iron of siderite is often partly replaced by calcium, magnesium, and manganese. It also occurs in crystallized, concretionary, massive, and earthy forms.

The name "siderite" is also applied to a translucent blue variety of vitreous quartz, which is also more commonly called sapphirine. See **IRON**; **METEORITE**.

**SIDEROXYLON** (Neo-Lat., from Gk. *σίδηρος*, *sīdēros*, iron + *ξύλον*, *xylon*, wood). A

genus of trees of the family Sapotaceæ, with evergreen leaves and axillary clusters of flowers, natives of and widely distributed in warm climates. They are remarkable for the hardness of their wood, which is sometimes called iron-wood and is, at least in some species, so heavy as to sink in water. About 60 species are widely distributed throughout the tropics of both hemispheres, with a few species reaching temperate regions in Australia, New Zealand, etc. A species, *Sideroxylon mastichodendron*, occurs along the east coast of Florida, where it is known as mastic and wild olive.

**SIDESADDLE FLOWER.** See SARRACENIA.

**SIDETUS, PHILIPPUS.** See DE BOOR FRAGMENT; PHILIPPUS SIDETUS.

**SIDEWALK, TRAVELING.** See TRAVELING SIDEWALK.

**SIDE/WIND'ER.** The local name in Arizona for the horned rattlesnake (*Crotalus cerastes*), which inhabits open plains and when disturbed moves away sideways. Consult Merriam, *The Death Valley Expedition* (Agricultural Department, Washington, 1893). See RATTLESNAKE, and Plate of RATTLESNAKES.

**SIDGWICK, ARTHUR** (1840-1920). An English classical scholar, brother of Henry Sidgwick. He was born in Yorkshire and was educated at Rugby and at Trinity College, Cambridge. He served as master of Rugby School (1864-79), tutor in Corpus Christi College, Oxford (1879-1902), and university reader in Greek (1894-1906). Of Corpus Christi he was a fellow from 1882 to 1902 and after 1903. His publications include an annotated edition of Vergil's complete works (1890); editions of plays of Æschylus (often reedited), *Agamemnon*, *Choephoroi*, *Æumenides*, *Persæ*, *Septem Contra Thebas*; a critical edition of the text of Æschylus, in the *Oxford Classical Texts Series* (1899); textbooks on *Greek Prose Composition* (1876), and on *Greek Verse Composition* (1882); and essays on educational topics such as *On Stimulus* (1908).—His daughter, **ETHEL SIDGWICK**, became known as the author of novels of distinction: *Promise* (1910); *Le Gentleman* (1911); *Herself* (1912); *Succession* (1913), a continuation of *Promise*; *Four Plays for Children* (1913); *A Lady of Leisure* (1914); *Duke Jones* (1915); *The Accolade* (1916).

**SIDGWICK, ELEANOR MILDRED** (MRS. HENRY SIDGWICK) (1845- ). An English educator, born in Scotland, the daughter of James Maitland Balfour and Lady Blanche Mary Gascoigne Cecil, and a sister of A. J. Balfour (q.v.). In 1876 she was married to Henry Sidgwick (q.v.). The two were closely associated with the movements for the development of higher education for women and the emancipation of women generally. For the promotion of the former there was established the Association for Promoting the Development of Higher Education for Women (1873), which led to the founding of Newnham College, Cambridge, in 1880. Of this college Mrs. Sidgwick was principal from 1892 to 1910. Her interest in education is further evidenced by her appointment as a member of the Bryce Commission on Secondary Education in 1894, the first instance in which women were included on a public educational commission in England. She was also one of the first members of the Consultative Committee of the English Board of Education (1899). In 1915 she held the presidency of the educational section of the British Association. She published *Health*

*Statistics of Women Students* (1890) and a number of essays and articles on the education of girls, on woman's suffrage, and on psychical research.

**SIDGWICK, HENRY** (1838-1901). An English moralist and economist, born at Skipton, Yorkshire, May 31, 1838. He was educated at Rugby and at Trinity College, Cambridge, was fellow of Trinity College from 1859 to 1869, and lecturer from 1859 to 1875, when he was appointed prælector of moral and political philosophy, and in 1883 he was appointed Knightbridge professor of moral philosophy. His principal works are: *The Methods of Ethics* (1874; 6th ed., 1901); *The Principles of Political Economy* (1883; 3d ed., 1901); *Outlines of the History of Ethics* (1886; 5th ed., 1902); *The Elements of Politics* (1891; 2d ed., rev., 1897); *Practical Ethics: A Collection of Addresses and Essays* (1898); *The Development of European Polity* (1903); *Lectures on the Ethics of T. H. Green, Herbert Spencer, and J. Martineau* (1902); *Philosophy: Its Scope and Relations* (1902); *Miscellaneous Essays and Addresses* (1904); *The Philosophy of Kant and Other Philosophical Lectures and Essays* (1905). He took a prominent part in the promotion of the higher education of women and was one of the founders of Newnham College, Cambridge. He helped largely to support *Mind*, an English philosophical quarterly, of which he was coeditor. He resigned his chair in 1900 on account of ill-health and died August 28 of the next year. In his *Methods of Ethics* he criticizes the ethics of intuitionism (q.v.) and common sense, of egoistic hedonism (q.v.), and of utilitarianism (q.v.), finally giving his adherence to a utilitarianism with an intuitional basis in the abstract moral principles of justice, prudence, and rational benevolence. He was a member of the Society for Psychical Research. He was a brother of Arthur Sidgwick and a cousin of the noted Benson family. For his wife, see SIDGWICK, ELEANOR. Consult: Bryce, *Studies in Contemporary Biography* (New York, 1903); A. S. and E. M. Sidgwick, *Henry Sidgwick: A Memoir* (London, 1906); W. P. Ward, *Ten Personal Studies* (New York, 1908); A. C. Benson, *Leaves of the Tree* (ib., 1911).

**SIDHIA.** See SINDIA.

**SIDI BEL ABBÈS**, sē'dē bēl āb'bās'. The capital of an arrondissement in the Department of Oran, Algeria, on the Mekerra, 48 miles by rail south of Oran. It is comparatively a modern town and is surrounded by walls. It has a considerable agricultural trade in grain, alfalfa, tobacco, wine, and cattle. Pop. (commune), 1911, 30,942.

**SIDI MOHAMMED** (1803-73). Emperor of Morocco from 1859 to 1873. He succeeded his father, Muley Abderrahman. He was soon involved in a war with Spain, caused by the marauding expeditions of the Riff pirates, was defeated by the Spanish under Prim and O'Donnell (1860), and obliged to pay an indemnity of 200,000,000 piasters. His introduction of reforms and the commercial concessions which he granted to foreigners caused several insurrections, in quelling one of which he lost his life. See MOROCCO.

**SIDIS, SI'DIS, BORIS** (1867-1923). An American psychopathologist, born in Russia. He came to America in 1887 and was educated at Harvard (A.B., 1894; Ph.D., 1897; M.D., 1908). He was associate psychologist and psychopathol-

ogist of the Pathological Institute of New York State Hospitals (1896-1901), and after 1901 practiced medicine in Boston, also becoming director of the Sidis Psychotherapeutic Institute at Portsmouth, N. H. He published *Psychology of Suggestion* (1898); *Psychopathological Researches* (1902); *Multiple Personality* (1905), with S. P. Goodhart; *An Experimental Study of Sleep* (1909); *Philistine and Genius* (1911); *The Psychology of Laughter* (1913); *The Foundations of Normal and Abnormal Psychology* (1914); *Symptomatology, Psychognosis, and Diagnosis of Psychopathic Diseases* (1914).

**SIDMOUTH**, sid'müth. A watering place on the south coast of Devonshire, England, at the mouth of the little river Sid, remarkable for its healthful climate and picturesque situation (Map: England, C 6). The esplanade, protected by a sea wall 1700 feet in length, forms an excellent promenade. The interesting parish church dates from 1259. Sidmouth was the residence of Queen Victoria when a child, and her father, the Duke of Kent, died here in 1820. Pop., 1901, 4200; 1911, 5612.

**SIDMOUTH**, HENRY ADDINGTON, first Viscount (1757-1844). An English statesman. See ADDINGTON, HENRY.

**SIDNEY**. A village in Delaware Co., N. Y., 44 miles northeast of Binghamton, on the Delaware and Hudson, and the New York, Ontario, and Western railroads (Map: New York, E 6). Noteworthy buildings are the public library, high school, and union station. The chief industrial establishments are silk mills, automobile works, sash and blind, cigar, and novelty factories, etc. Pop., 1900, 2331; 1910, 2507.

**SIDNEY**. A city and the county seat of Shelby Co., Ohio, 40 miles north of Dayton, on the Great Miami River, the Miami and Erie Canal, and on the Cincinnati, Hamilton, and Dayton, the Western Ohio, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, B 5). The public library, Monumental Building, courthouse, and Wagner's Park are noteworthy features. Sidney is of considerable industrial importance. The manufactures include road scrapers, whips, hollow ware, corn shellers, horse collars, fly nets, poles and shafts, churns, wheels, carriages, iron and wood workers' tools, aluminium ware, brooms, bicycle rims, newspaper folders, and flour. Pop., 1900, 5688; 1910, 6607.

**SIDNEY**, ALGERNON (1622-83). An English Revolutionary statesman. After his education he accompanied his father, the second Earl of Leicester, on embassies to Denmark and France. His first military service was against the rebels of Ireland in 1641, his father being Lord Lieutenant there. In the Civil War he fought for Parliament. The year 1647 saw him lieutenant general of the Horse in Ireland, and the next year he became Governor of Dover, remaining there more than two years. In 1645 Cardiff had returned him to the Long Parliament, and three years afterward he was appointed a commissioner for the trial of Charles I. He absented himself from the sessions of the court, because he wished to keep himself "clean from having any hand in this business." His objection to the trial of the King was that the House of Lords had not assented to it. But it is said that he afterward spoke of the execution as "the justest and bravest action that was ever done in England or anywhere else."

VOL. XXI.—6

In principle a severe republican, he resented the concentration of power in Cromwell. When the restored Parliament met in 1659, Sidney was again nominated to the Council of State and dispatched to Denmark on a political mission. After the Restoration he lived on the Continent, subjected to enmities, flitting about from place to place. In 1677 Charles II pardoned him and he returned to England.

Holding persistently to his old principles, however, he favored the Duke of Monmouth as successor to Charles II in place of the Duke of York. For this he solicited the aid of the French monarch. His designs were suspected, and when the Rye House Plot was discovered in June, 1683, the opportunity was seized to be rid of a man felt to be dangerous. He was arrested and committed to the Tower and tried for high treason on November 21 before the brutal Jeffreys, who on the merest mockery of evidence condemned him to death. The execution took place December 7 on Tower Hill. His firmness in death awakened the sympathy and the indignation of the public, which has ever since revered him as a patriot hero and martyr. In the history and theory of government Sidney was more deeply learned than any other man of his time. His *Discourses Concerning Government* were published in London in 1698, and his entire works appeared in 1772.

Consult G. W. Meadley, *Memoirs of Algernon Sidney* (London, 1813), and A. C. Ewald, *Life and Times of Algernon Sidney* (ib., 1873).

**SIDNEY**, SIR PHILIP (1554-86). A celebrated English writer and soldier. He was born at Penshurst in Kent, Nov. 30, 1554, and received his education at Shrewsbury, whence in 1568 he went to Christ Church, Oxford. He left the university without a degree, but with a high reputation for scholarship. In 1572 he traveled abroad. He was in Paris when the Massacre of St. Bartholomew took place, but ran no personal risk, being under protection of the English embassy. He then visited Belgium, Germany, Hungary, and Italy, occupying most of his time in studying languages, literature, history, and politics, and cultivating the acquaintance of eminent men; and in 1575 he returned, an erudite and polished gentleman. His uncle (Dudley, Earl of Leicester) was now in the zenith of his fortunes, and for Sidney a career at court lay open. With Queen Elizabeth he was throughout life an especial favorite. In 1577 she intrusted him with a mission to Heidelberg and Prague and, though he failed in his negotiations, he was warmly commended. Three years after, he had the boldness to address to the Queen a "remonstrance" against her proposed marriage with Henry, Duke of Anjou, a union to which she seemed herself not indisposed. It is significant of his high favor that Elizabeth, imperious in temper and little inclined to brook interference, was satisfied with his short retirement from court. This interval he passed in literary work at Wilton with his sister the Countess of Pembroke. For her entertainment he wrote his celebrated pastoral romance, *Arcadia*, published posthumously by his sister in 1590. In 1583 he consoled himself for the marriage of Lady Penelope Devereux, to whom he had been ardently attached and who figures as Stella in his poems, by marrying Frances, daughter of Sir Francis Walsingham. In 1585 he is said to have meditated sailing with Sir Francis Drake in an expedition against the

Spaniards in the West Indies, but to have been forbidden by Elizabeth through fear "lest she lose the jewel of her dominions." Late in that year, however, she appointed him Governor of Flushing, whither he went to take part in the war then waging between her allies, the Dutch and the Spanish. At the battle of Zutphen in Gelderland a horse was killed under him, and he received a musket shot in the thigh from which after great suffering he died at Arnheim on Oct. 7, 1586. While he was borne from the field, as he complained of thirst, a bottle of water was brought him; but when about to drink, he was touched by the wistful look of a mortally wounded soldier close by, and, taking the water untasted from his lips, Sidney handed it to his fellow with the words, "Thy necessity is greater than mine." The esteem in which Sidney was held by his countrymen was shown in the grief with which the news of his death was received. His body was brought to England and after lying in state was buried with great solemnity in the old cathedral of St. Paul's. The universities of Cambridge and Oxford issued three volumes of elegies on his death, and Spenser, in his *Astrophel*, mourned the loss of his friend.

The love and admiration which Sidney won from his contemporaries were a tribute to the singular beauty of his character. His short life was marked by no brilliant achievement, and his literary genius would scarcely of itself have sufficed to account for the regard he inspired. Sidney's *Arcadia*, overrun as it is with affectations, may still be recognized as a work of great merit. His other well-known work, *Apologie for Poetrie* (1579), republished in 1598 as *Defense of Poesie* (q.v.), will repay the attention of the reader. Many of his shorter poems, more especially some of his sonnets, are also of rare merit. Consult his *Complete Poems* (ed. by Grosart, London, 1877); *Apology for Poetry* (ed. by Shuckburgh, Cambridge, 1891); *Miscellaneous Works* (Boston, 1860; London, 1893); H. R. Fox Bourne, *A Memoir of Sir Philip Sidney* (London, 1862); J. A. Symonds, *Sir Philip Sidney* (ib., 1886); Sir Sidney Lee, "Sir Philip Sidney," in *Great Englishmen of the Sixteenth Century* (New York, 1904), containing a bibliography; Sir Fulke Greville, *Life of Sir Philip Sidney* (Oxford, 1907); Percy Adleshaw, *Sir Philip Sidney* (London, 1909).

**SIDNEY SUSSEX COLLEGE.** A college at Cambridge, England, founded in 1596 by the will of Lady Frances Sidney, Countess Dowager of Sussex. It was built on the site of the Franciscan or Grey Friars' House, established in 1240, and was called the College of Lady Francis Sidney Sussex. The house of the Franciscans had been suppressed in 1538 and the site given to Trinity College. Trinity transferred it to the new foundation. Sidney Sussex was early a "nursery of Puritanism" and was the first college in Cambridge to admit Scotch and Irish. In 1914 there were a master and 12 fellows, 36 scholars, and about 120 undergraduates. It presents to eight livings. Among the worthies of this college are Oliver Cromwell, Thomas Fuller, and Archbishop Bramhall. Consult G. M. Edwards, *Sidney Sussex College* (London, 1899).

**SIDON** (Heb. *Sidon*, from *süd*, to hunt, to fish, or from *Sid*, name of a tribal god). A city of ancient Phœnicia, on the coast of the Mediterranean, about 25 miles south of Beirut (Map:

Turkey in Asia, C 4). It was situated on a promontory with an island in front and possessed a double harbor. It was specially famed for its purple dyes, and its inhabitants are said to have discovered the manufacture of glass. Sidon is mentioned in Papyrus Anastasi I. Among the Amarna Tablets are some from its prince Zimrida (c.1400 B.C.). The Phœnicians are called Sidonians by Homer (*Iliad*, xxiii, 743 ff.; *Odyssey*, iv, 613 ff., xv, 460). Sidon sent presents to Asurnazirpal III in 877 B.C. It was subdued by Sennacherib in 701 and severely punished by Esarhaddon in 674. The revolt of Tennes II led to the destruction of the city by Artaxerxes III Ochus in 351 B.C. It was a free city under the Romans. It surrendered to the Moslems in 637 or 638. During the period of the Crusades it suffered greatly and passed back and forth from Mohammedans to Christians, ultimately remaining with the former. Under the Druse prince Fahr al din (1595-1634) its importance revived; it became the seaport of Damascus and for nearly 200 years had an important trade. The present town of Saida occupies the western portion of the site of the ancient city. It has about 12,000 inhabitants and is relatively unimportant as compared with Beirut, which has become the seaport of the district. Missionary establishments are maintained by both Protestants and Roman Catholics. The many tombs of the ancient city have yielded a large number of interesting sarcophagi, including that of Eshmunazar (1855), now in the Louvre, and 17 other Phœnician and Greek sarcophagi, among them that of Tabnit, the father of Eshmunazar, and the so-called sarcophagus of Alexander, now in Constantinople (1887). See PHœNICIA; PHœNICIAN ART.

**SIDON, ZENO OF.** See ZENO OF SIDON.

**SIDONIA, ORDER OF.** A royal Saxon order of merit for women, conferred for voluntary services in war and peace. It was established in 1870. The decoration is an eight-pointed cross of white enamel, edged with gold, suspended from a crowned wreath inclosing the initial S.

**SIDRA, GULF OF** (Lat. *Syrtis Maior*). A large open arm of the Mediterranean Sea on the coast of Tripoli (Map: Africa, F 1). It is nearly 300 miles wide at the mouth and extends inward from 75 to 125 miles. Its shores are low and bordered by shallow and dangerous waters, affording scarcely any harbors. The Gulf of Sidra forms the eastern angle of the larger rectangular gulf of the two Syrtes, the western angle being now called the Gulf of Gabes (q.v.).

**SIEBECK, zē'bēk, HERMANN** (1842- ). A German philosopher. He was born at Eisen, studied philology at Leipzig, Berlin, and Halle, and was privatdocent of philosophy at Halle in 1872-75, and professor of philosophy at Basel in 1875-83 and thenceforth at Giessen. At first he was allied with the Herbartian school of philosophy, but later became known as a Kantian. He published: *Untersuchungen zur Philosophie der Griechen* (1874; 2d ed., 1888); *Das Wesen der ästhetischen Anschauung* (1875); *Das Traumleben der Seele* (1877); *Ueber das Bewusstsein als Schranke der Naturerkenntnis* (1878); *Geschichte der Psychologie* (1884); *Ueber die Lehre vom genetischen Fortschritte der Menschheit* (1892); *Lehrbuch der Religionsphilosophie* (1893); *Aristoteles* (1899; 3d

ed., 1910); *Goethe als Denker* (1902; 2d ed., 1905); *Zur Religionsphilosophie* (1907); *Grundfragen zur Psychologie und Aesthetik der Tonkunst* (1909); *Ueber Freiheit, Entwicklung, und Vorsehung* (1911).

**SIEBENGEBIRGE**, zē'ben-ge-bēr'ge. A group of seven conical heights in the Rhine Province, Prussia, on the right bank of the Rhine, opposite Bonn, 22 miles above Cologne. The chief peaks are the Oelberg (1522 feet), the Löwenburg, and the Drachenfels (q.v.). The scenery is strikingly picturesque, and the region is intimately connected with the history and legend of the surrounding country.

**SIEBOLD**, zē'bōlt, ADAM ELIAS VON (1775-1828). A German obstetrician. He was born in Würzburg, where his father, Karl Kasper von Siebold (1736-1806), held the chair of surgery at the university and where his elder brother, Johann George Christoph von Siebold (1767-98), was professor of gynecology. Adam Elias von Siebold received his education in his native town, became professor of medicine at the university in 1799, and was called in 1816 to the University of Berlin to fill the chair of obstetrics. There he was instrumental in the foundation of the obstetrical hospital of the university. Among his works are: *Lehrbuch der Hebammenkunst* (1808; 5th ed., 1831); *Lehrbuch der theoretisch-praktischen Entbindungskunde* (1809; 4th ed., 1824); *Handbuch zur Frauenzimmerkrankheiten* (1811; 2d ed., 1821-23). He also edited from 1813 the *Journal für Geburtshilfe*. See also **SIEBOLD**, EDUARD and **PHILIPP**.

**SIEBOLD**, EDUARD KASPER JACOB VON (1801-61). A German gynecologist. The elder son of Adam Elias von Siebold (q.v.), he was born at Würzburg, where, as well as at Berlin, he was educated. In 1829 he became professor of gynecology at Marburg and four years later at Göttingen. He is well known through his classical *Versuch einer Geschichte der Geburtshilfe* (1839-45; 2d ed., 1901). Among his other works may be mentioned *Lehrbuch der Geburtshilfe* (1841; 2d ed., 1854) and *Lehrbuch der gerichtlichen Medizin* (1847). At the death of his father he became editor of the *Journal für Geburtshilfe*.

**SIEBOLD**, KARL THEODOR ERNST VON (1804-85). A German physiologist and zoölogist, younger son of Adam Elias von Siebold (q.v.). He was born in Würzburg and studied medicine and science at Göttingen and Berlin. He became director of the Obstetrical Institute at Danzig (1835) and was professor of physiology successively at Erlangen, Freiburg, Breslau, and Munich (1853), where later he was transferred to the chair of zoölogy. He did pioneer work in the classification of animals, was the first to define the groups Protozoa and Zoöphyta, and divided Cuvier's group of Articulata into Arthropoda and Vermes. With Kölliker he founded in 1848 the *Zeitschrift für Wissenschaftliche Zoölogie*. His obituary notice in the *Zeitschrift* for 1885 gives a bibliography of 197 titles. Among these were important papers on animal spermatozoa, especially in the insects, and on parthenogenesis in insects. He demonstrated that spermatozoa winter in the seminal receptacles of the female wasp. With Stannius he published *Lehrbuch der vergleichenden Anatomie der Wirbellosen Thieren* (1846-48; 2d ed., 1854).

**SIEBOLD**, PHILIPP FRANZ VON (1796-1866).

A Bavarian physician, naturalist, and traveler, son of Eduard von Siebold. He was born at Würzburg. After studying medicine and science he entered the service of the Dutch East India Company in 1822 and proceeded to Batavia. From Java he went in 1823 to Nagasaki as the leader of a scientific mission to Japan. He quickly mastered the Japanese language and in 1826 reached Yeddo with the Dutch embassy, remaining in that city, but getting into trouble through the purchase of a map, such transfer of knowledge to an alien being then forbidden. He was imprisoned, and banished from Japan in 1830. He had, however, been the teacher of many native physicians. After his return to Europe he spent nearly 30 years in writing his great work, entitled *Nippon, Archiv zur Beschreibung von Japan* (1832-51); in arranging his collections at the museums of Leyden, Munich, and Würzburg; and in the composition of works on the fauna, flora, and bibliography of Japan. In 1859 he revisited Japan and was invited to court by the Emperor and in 1861 entered the Japanese service as a negotiator with the Powers, but difficulties arose which compelled him to retire. He returned to Europe in 1862, where he published various papers relating to Japan. He died at Munich. A monument to him has been erected in Japan by the Japanese. Consult **Siebold**, *Leben und Wirken von P. F. von Siebold* (Würzburg, 1896).

**SIEDLCE**, shēl'tsē. A government in the east of Russian Poland, between the Bug on the east and the Vistula on the west (Map: Russia, B 4). Area, about 5535 square miles. It is mostly flat and marshy in the southeast. Agriculture is the principal industry and is carried on by modern methods. Stock raising is also important. The chief manufactures are spirits, sugar, and glass. Toys, agricultural implements, and bricks constitute other industries. Pop., 1912, 1,032,700. In the War in Europe (q.v.) this government was directly affected by the German invasion of Russian Poland.

**SIEDLCE**. The capital of the Government of Siedlee in Russian Poland, about 50 miles east-southeast of Warsaw (Map: Russia, B 4). It is little more than an administration centre of the government, and its economic importance is slight. Its principal manufacture is agricultural implements. It was for a long time in the possession of the Czartoryskis. Siedlee was captured by the Germans in the Great War which began in 1914. See **WAR IN EUROPE**.

**SIEGBURG**, zēk'burg. A town of the Rhine Province, Prussia, at the meeting of the Agger and Sieg, 16 miles by rail southeast of Cologne (Map: Germany, B 3). The Benedictine abbey (1060) is now used as a prison. Siegburg is a manufacturing and mining town. It has a royal projectile factory, pottery works, lignite mines, and stone quarries. Pop., 1910, 17,280. Siegburg was a wealthy and prosperous city in the Renaissance period and famous for the curious and artistic Siegburg pitchers.

**SIEGE AND SIEGE WORKS** (OF. *sege*, *siege*, Fr. *siège*, from Lat. *sedere*, to sit; connected with Gk. *ἵεσθαι*, *hezesthai*, Ger. *sitzen*, Goth. *sitan*, AS. *sittan*, Eng. *sit*). A siege is, as its derivation indicates, the sitting of an army before a fortified place for the purpose of compelling surrender. Siege works comprise all the engineering devices resorted to by besieger and besieged in the attack and defense of a strong fortification. The increase in the

size of armies participating in the more recent wars has caused them more nearly to fill the possible fronts and has made it more difficult to develop surprises, flanking, and other manœuvres to the same relative extent as with former smaller armies. As a result mobile armies are more apt to face each other for longer periods over longer fronts. Attention is concentrated on the front attack, and in lieu of some of the lost mobility increasing use has been made of some devices of siege warfare, notably mines and mining, trenches and overhead cover.

The conditions of regular sieges are more alike in different times and places than those of operations with mobile forces, and the best methods can therefore be stated quite definitely. In conducting a siege the enemy is first surrounded and cut off from supplies, reinforcements, and retreat. His position is then said to be invested. The attacking army in doing this usually intrenches itself completely around and outside the land works of the defender and patrols the sea front if there be one. With plenty of time and no prospect of the arrival of relieving forces, an effective investment reinforced by bombardment may cause the defender eventually to starve or surrender without extreme effort by the besiegers. In other cases, as at Mafeking and Ladysmith, the prospective arrival of a relieving force must always be borne in mind and the attacker must use every means at his command to force the issue.

If the defenders are in a position to construct bomb proofs sufficient to enable them to hold out against bombardment, it then becomes necessary to resort to a regular siege. The method of procedure is then as follows: The artillery being in a position best adapted to enable it to fire upon the artillery of the defense, the infantry is established in front of this in intrenchments, and attempts are made to hold down the fire of the defenders and to push infantry intrenchments as close as possible to the work. This is done by the construction of large sections of intrenchments parallel to the main line of the defender. In following the method known as flying sap, a large force of men upon the fall of darkness moves forward the position, carrying gabions or boxes, picks,

FIG. 1. SAPPING.

and shovels. When the line has been moved as far forward as is deemed advisable, the gabions are placed and the men dig the earth from behind them, filling first the gabions and then throwing the earth in front of them. When such advances are not practicable the trenches are pushed forward obliquely by end work. These approaches are so inclined that they cannot be enfiladed by the enemy. This process

is known as sapping. Counter attacks by the besieged are kept down by artillery fire. An advanced position having been gained is strongly fortified.

By these methods the attack is pushed to a position close to that held by the defenders.

FIG. 2. CASEMATE IN TRENCH.

If the latter are provided with sufficient provisions and material to enable them to hold out without surrender on account of starvation resort is had to mining (q.v.). Assaults are delivered by the attacking force on the weakest points of the work. These assaults frequently follow immediately after a mine explosion. The assaulting party is provided with explosives to be used in demolishing the palisades and similar obstructions, and with ladders, planks, wire cutters, and other implements to enable it to surmount and cope with the obstacles it may find. From the nature of the case, if the defender is prevented from receiving supplies and the attacker can receive such reinforcements

FIG. 3. CASEMATE IN TRENCH (ENTRANCE FROM END).

and supplies as he requires, the victory is eventually with the attacker. It may, however, be only necessary for the defender to hold out until a relieving force can reach the place. It is therefore incumbent upon him to resort to means to protract the defense. Having noted, e.g., that an attack will probably be successful upon certain portions of his line, an additional line should be constructed in rear of this portion and so fortified that it can be held even if the first falls. His fire is so directed as to delay the attacker's trench work. His force, while not large enough to defeat the attacker in open combat, may be large enough to threaten him so frequently as greatly to diminish his endurance. Sorties are frequently made at night, surprising the operations of the attacking force, destroying its material, its work, and generally lowering its morale. Searchlights, torches, rockets, and light bombs are used to expose the night operations of the enemy.

The location and construction of the emplacements for the siege batteries are works of the greatest importance. Ingenuity should be exercised in adapting batteries to the nature of the ground and in making them as inconspicuous as possible. In view of the development of aircraft it is well to locate them, when possible, in the edges of woods and to screen them from sight.

When the fortified place being besieged is a city or intrenched camp surrounded according

to modern practice with one or more lines of forts and redoubts, and the siege is successful, and one or more of the outer forts has first been captured, the attacking force advances through the gap and takes up new positions which assist the attacks on the neighboring forts and ultimately on the central defense.

Given equal interest in the attack and defense, equal opportunity for preparation, and equal ability and training on the part of the troops and the commanders, a fortified place should be able to hold out a long time against siege. Many fortified places may, however, not be attacked. If every improvement were introduced in every fort, the cost would be great. It may therefore readily happen that certain forts will not be abreast of the development of the military art in all particulars, particularly as to size of guns. On the other hand, an attacking army with a limited number of modern guns may, with good roads and transportation facilities, shift them to attack a fort with guns of less range. When the discrepancy in power and range of guns is great, the guns of the fort may be outranged and unable to develop even their true value. If an attack on a fortified place has sufficient superiority, it may therefore be successful without even completing the investment and resorting to a real siege, although such attacks are sometimes spoken of as sieges.

Sieges are comparatively few in a war as compared with the number of battles and other engagements. The siege of Vicksburg is an instance of an investment carried to a logical conclusion. The Confederate army in the city was surrounded and cut off from its source of supplies. The Union army, under General Grant, constructed a line of intrenchments to resist possible attacks by other Confederate troops for the relief of the city. Although General Grant was gradually pressing his lines forward, the place eventually capitulated as the result of starvation. During the Franco-Prussian War of 1871 the sieges of Strassburg, Metz, Paris, and Belfort were carried on under different conditions and with different results. The siege of Fort Wagner, one of the defenses of Charleston, S. C., by the Union troops was unique in certain respects. Assaults having failed, recourse was had to advances by parallels and approaches. The time arrived when it seemed impossible to make further headway by this method. Mining could not be resorted to, since the bottoms of the trenches were already near the level of the ground water. The proximity of the forts to deep water enabled the Union gunboats to add their fire to that of the besieging batteries and so keep down the fire of the fort that the besiegers were able to advance their trenches with great rapidity. In this way the works were carried right up to the fort. The night before the Union troops were to make the second assault the Confederates abandoned the fort. In the Russo-Turkish War (q.v.) Plevna is notable. Geök Tepe is an instance where a large but poorly disciplined and poorly equipped Turcoman army was besieged and overcome by a smaller but aggressive Russian army. The strongly defended position of Port Arthur in the Russo-Japanese War fell in 1904, after a long siege, as a result of investment on the land front and control of the sea on the water front, partly successful assaults, lack of supplies, and the continuous

bombardments. The siege and capture of Adrianople by the Bulgarians and Serbians in 1912 is one of the latest modern sieges. The city lay at the junction of three rivers in a gap in a line of mountains which form a natural line of defenses, and its strategic value has always been recognized. In the Great War of 1914 the regular sieges at Namur, Maubeuge, Novo Georgievsk, and Przemysl have furnished much material for technical discussion so far as facts concerning them are available. The same is true of the attacks on some fortified places which were captured without complete investment, as Liège, Antwerp, and Warsaw. See WAR IN EUROPE.

Consult: *Mercur, Attack of Fortified Places* (New York, 1894); *Chatham Manual of Military Engineering*, part ii, *Attack of Fortresses* (London, 1896); *United States Engineer Field Manual* (Washington, 1909); *The International Military Digest* (current, West Point, N. Y.). See also articles on FORTIFICATION; FORTIFICATIONS, ATTACK AND DEFENSE OF; HOWITZER; MINES AND MINING, MILITARY; SIEGE ARTILLERY; TACTICS, MILITARY.

**SIEGE ARTILLERY.** (Artillery used to reduce permanent or semipermanent fortifications during the course of a siege. It usually consists of guns, howitzers, and mortars larger than 6-inch calibre, but not necessarily, since smaller calibre may sometimes be effectively employed in such operations. The term is derived from the special use of the pieces in siege operations rather than from the size of calibre. Calibres up to the 6-inch howitzer may be transported by horse draft and for this reason may accompany the mobile army. Calibres above 6-inch cannot, as a rule, accompany mobile troops and must be brought up by rail, traction engine, or motor trucks for the specific purpose of a siege and there be more or less permanently emplaced on wood or concrete platforms. Yet, as the Great War demonstrated, under modern conditions of transportation there is practically no limit to the size of siege guns.

In European countries siege artillery is handled by a special organization called fortress artillerymen, for which there is no corresponding class in the United States army. In case such artillery was needed in the United States it would probably be manned by personnel detached from the Coast Artillery Corps.

During the Great War the Germans employed, among other ordnance, the following siege pieces: 8.3-inch howitzer, 11-inch siege howitzer, 16.5-inch mortar, the largest ever used in siege or other operations. The Austrians used a 12-inch mortar; the French an 11-inch howitzer, of which there were but few in the beginning of the war. (These are discussed under HOWITZER; MORTAR.) The English largest siege piece, in the early stages of the war, was a 9.2-inch howitzer. In this war guns that once properly would have been designated siege guns were used with great effect against personnel, and it is probable the distinction that the siege gun is used for reducing permanent and semipermanent works will not be sufficient in the future properly to distinguish it from light guns. A more logical designation will probably be that a siege gun is a weapon which is too heavy to accompany small bodies of mobile troops, but which will be sent with field armies.

In the United States army there were two old model siege pieces, viz., the 5-inch siege

gun and the 7-inch siege howitzer. A 9.5-inch siege howitzer is the largest calibre included in the project of 1915. The larger calibres in use or under construction embody the principle of the howitzer in that the charges may be varied to obtain steeper slopes of fall of the projectile at shorter ranges than can be obtained with the siege gun proper. See ARTILLERY; FIELD ARTILLERY; HEAVY FIELD ARTILLERY; ORDNANCE.

**SIEGE GUNS.** See SIEGE ARTILLERY.

**SIEGEN**, zē'gen. A town in the Province of Westphalia, Prussia, situated on the river Sieg, 47 miles east by south of Cologne. It has two castles of the princes of Nassau-Siegen and an important school of mines. Siegen is an important iron centre, the vicinity abounding in iron, copper, lead, and zinc mines. In and about the town are numerous puddling and rolling mills, machine works, and paper, cloth, and leather manufactories. Pop., 1910, 27,416.

**SIEGEN**, LUDWIG VON (c.1609–after 1676). A German engraver, inventor of the art of mezzotint. He was born in Utrecht but early entered the service of the Landgrave of Hesse-Cassel. Later he went to Amsterdam, where in 1642 he produced the first known mezzotint engraving, a portrait of the Landgravine Amalia Elisabeth, Regent of Hesse. This was followed by portraits of William of Orange and Mary his wife (1643–44), and of Eleanora Gonzaga. Siegen then passed into the service of the Elector of Mainz and the Duke of Wolfenbüttel. He kept his invention secret until 1654, when in Brussels he divulged it to Prince Rupert of the Palatinate, through whom it became known in England. Siegen's work, though that of an amateur, has delicacy and charm.

**SIEGE PERILOUS.** One of the three seats left unoccupied at the Arthurian Round Table, so called because it was reserved for him who was to find the Holy Grail, and any other bold enough to sit in it forfeited his life. See GALAHAD.

**SIEGE WORKS.** See SIEGE AND SIEGE WORKS.

**SIEGFRIED**, zēk'frēt. A music drama in three acts by Richard Wagner. It is the third in the tetralogy of the *Ring des Nibelungen* and was first produced at Bayreuth Aug. 16, 1876. The first American production was at the Metropolitan Opera House, New York, Nov. 9, 1887. See RING OF THE NIBELUNGEN.

**SIEGFRIED**, KARL (1830–1903). A German Protestant theologian, born at Magdeburg. He was called to the University of Jena in 1875 as professor of Old Testament literature. In 1885 he was appointed to the Lutheran Consistory. The following publications bear his name: *Spinoza als Kritiker und Ausleger des Alten Testaments* (1867); *Eusebii Canonum Epitome* (1884), with H. Gelzer; *Lehrbuch der neuhebräischen Sprache und Litteratur* (1884), with Strack; *Hebräisches Wörterbuch zum Alten Testament* (1893), with Stade.

**SIEGLIND**, zēk'līnt. In the Nibelungen legend, the wife of Siegmund and mother of Siegfried.

**SIEMENS**, sē'menz, C. W. See IRON AND STEEL, *Open Hearth Process*.

**SIEMENS**, zē'mens, (ERNST) WERNER VON (1816–92). A German electrical engineer. He was born at Lenthe in Hanover and was educated in the Gymnasium of Lübeck and in the school of artillery and engineering at Berlin,

becoming an artillery officer in 1838. He studied chemistry and electromagnetism, and invented a process for electroplating in 1841. In 1848 he became commandant of the artillery arsenal in Berlin. He was the first to explode a submarine mine by electricity (1848). Devoting himself to electrical engineering, he was engaged after 1849 in the establishment of telegraph lines, particularly through Russia, Brazil, Spain, and northern Germany. He was the first to suggest gutta-percha as an insulating material for electrical conductors. In 1856 he devised the improved shuttle armature which increased the efficiency of the magnetomachine, and in 1876 demonstrated that its electromagnets could be used without separate exciters, the current being passed through the field coils. He proposed as the unit of resistance a column of mercury 1 meter long and 1 square millimeter in cross section at 0° C. This was known as the Siemens unit. Siemens was also active in promoting electric traction in Germany, and the first electric railway was erected at the Berlin Industrial Exhibition of 1879 by Siemens & Halske, a firm of electrical engineers and manufacturers founded by him and destined to play an important part in the commercial utilization of electricity. His researches in electricity resulted in discoveries and improvements of great value, one of which was the determining of the locations of injuries in submerged cables and also of charging them in order to reduce the disturbing influence of induced currents. In 1884, by the gift of about \$125,000, he made possible the foundation of the Imperial Physico-Technical Institute (Reichsanstalt), which soon became an important factor in German scientific research and manufacturing. (See LABORATORY.) He wrote numerous scientific works, collected as *Wissenschaftlichen und technischen Arbeiten* (1889–91). Consult his *Lebenserinnerungen* (Berlin, 1892; 8th ed., 1908; Eng. trans., *Personal Recollections of Werner von Siemens*, New York, 1893).

**SIEMENS**, SIR WILLIAM (KARL WILHELM) (1823–83). An English engineer and metallurgist, born at Lenthe, Hanover, and a brother of Werner Siemens, with whom he was associated in scientific investigations and commercial enterprises. He was educated at Magdeburg and Göttingen and then entered a manufacturing establishment in the former town. He visited England in 1843 to introduce his brother's process of electroplating, and again in 1844, when he endeavored to dispose of the English rights of a chronometric governor for steam engines and the anastatic process of printing. Settling in England, but maintaining connection with his brother, he devoted himself to perfecting a regenerative steam engine, but was not altogether successful and turned his attention to a water meter, which soon came into extensive use. His next and most important invention was the regenerative furnace, which he applied to iron and steel working and to which from time to time he added important improvements. (See IRON AND STEEL.) He was interested with his brother in electrical enterprises and conducted the British branch of the business, which in 1874 laid the direct Atlantic cable from the ship *Faraday*, a vessel designed by him for that purpose. Sir William played an important part in the application of electricity to lighting and traction in England. Besides many useful inventions, among which

were a pyrometer and the bathometer, apparatus for producing low temperatures (see REFRIGERATION), he also carried on important investigations in pure science. In 1850 he became a British subject, and in 1883 he was knighted. He received many honors, including the Bessemer medal of the Iron and Steel Institute of Great Britain, the French Legion of Honor, and honorary degrees from the universities of Oxford, Dublin, and Glasgow. He was president of the Society of Telegraph Engineers, the Institution of Mechanical Engineers, the Iron and Steel Institute, and the British Association for the Advancement of Science and was a member of many other British and foreign societies. A laboratory of electrical engineering was constructed by his widow at King's College, London, as a memorial. His collected works were published in 1889. Consult William Pole, *Life of William Siemens* (London, 1889), and Richard Hennig, in *Buch der berühmter Ingenieure* (Leipzig, 1911).

**SIEMERING**, zē'me-rīng, RUDOLF (1835-1905). A German sculptor. He was born at Königsberg and studied at the academy there and afterward under Bläser in Berlin, where he first made a name with his marble statue of King William, for the Exchange. The monuments to Dr. Gräfe, the famous oculist (1882; Berlin), to Frederick the Great (1877; Marienburg), and to Luther (1883; Eisleben), also preceded his two greatest achievements, the War Monument (1888) on the Market Square at Leipzig and the Washington Memorial in Fairmount Park, Philadelphia (1883; unveiled 1897). Among his later works are the marble group of Frederick William I (1900) and the Haydn-Mozart-Beethoven Monument, both in the Thiergarten, Berlin. Siemering marks the transition from the school of Rauch to the modern Realistic school and is noted for severe truthfulness and careful treatment of form. Consult the monograph by Daun (Bielefeld, 1906).

**SIEMIRADZKI**, syé'mé-räts'kê, HENRYK (1843-1902). A Polish historical painter. He was born near Kharkov, Little Russia, and studied at the Academy of St. Petersburg, winning the traveling scholarship in 1871. After a short sojourn in Munich he settled in Rome. The subjects of most of his brilliantly colored paintings are scenes from the life of ancient Greece and Rome. He first gained fame with "The Living Torches of Nero" (1876; National Museum, Cracow), but usually chose joyous themes with sunny landscape backgrounds revealing a modern comprehension of light and air, such as "Sword Dance" (1880) and "Phryne at Eleusis" (1889; Alexander Museum, St. Petersburg). He also painted religious subjects, including "Christ with Mary and Martha" (1886; ib.), and decorated several churches in Moscow and Cracow.

**SIENA**, syé'nâ. The capital of the Province of Siena in Tuscany, Italy, picturesquely situated on the crests of three hills, over 1100 feet above the sea, near the Elsa, 60 miles by rail south of Florence and only about 30 miles in a straight line (Map: Italy, C 3). It is a delightful mediæval city. The climate is salubrious, the weather, owing to the elevation, not being hot in summer. The town is irregularly built, with crooked, steep, and narrow streets, and retains its ancient walls, which inclose an area of about 2½ square miles. The centre of life

in Siena is the fine Piazza di Vittorio Emanuele (formerly called Piazza del Campo), containing the (restored) Gaya Fountain by Della Quercia (1408) and bordered by rich palaces. Of these structures the Palazzo Pubblico and the Palazzo del Governo (Piccolomini) are the most striking. The former, begun in 1289, is of brick, with a superb slender tower called Del Mangia, 285 feet high, and is a fine specimen of the Italian civic Gothic style. The interior is rich in mural decorations of the Sienese school (see PAINTING), and there are a chapel and a porch at the foot of the tower. The Palazzo del Governo, dating from 1469, has an interesting façade and holds the important archives of Siena. The fine brick Gothic Buonsignori Palace is also worthy of mention.

Siena is famous for its cathedral. This edifice, which is situated on the crowning point of the city, was begun in 1243. It has a dome, a campanile, and is irregular in shape. Its façade, begun in 1284 and planned by Giovanni Pisano, is a far-famed rival of that of the Orvieto Cathedral and is composed of black, white, and red marble, varied with profuse decorations. The interior is also remarkable, its pavement ornamented in black inlay with scenes from biblical history being of exceptional interest. There are also in the cathedral a noteworthy portal, Donatello's bronze statue of John the Baptist, and a rare octagonal pulpit by Niccola Pisano and others. The splendid cathedral library was built in 1495 and was decorated by Pinturicchio. The church of San Giovanni, under the choir of the cathedral, was begun in the early fourteenth century and has an uncompleted façade. The Oratorio di San Bernardino is important for its pictures by Sodoma.

Siena is a lively trading and manufacturing town, weaving being the conspicuous industry. Cloth, silk, velvet, and furniture are exported. The university was famous in the Middle Ages, but now has less than 300 students. The Reale Collegio Tolomei (lyceum) deserves to be mentioned. The institute of fine arts is notable for its early Sienese specimens. The Opera del Duomo also possesses an art collection. The school of arts and trades was founded in 1876. The public library contains 83,250 volumes and 5000 manuscripts. Pop., 1901 (town), about 25,000, (commune) 38,665; 1911, 41,673.

**History.** Siena (Lat. *Sena Julia* and *Colonia Seniensis*) was made a Roman colony in the time of Augustus. The city rose to great importance in the Middle Ages. The people wrested the governing power from the nobles in the twelfth and thirteenth centuries. The city became a Ghibelline stronghold, and in 1260 its citizens defeated the Guelphs of Florence at Monte Aperto. A few years later, however, it was forced by Charles of Anjou to join the league of the Guelph cities of Tuscany. It was at the height of its prosperity at the time of the Renaissance. In 1557 it was annexed to the Florentine dominions. In the history of art from 1200 to 1500 Siena stands in the front rank among Italian cities. Consult: Langton Douglas, *History of Siena* (New York, 1903); Ferdinand Schevill, *Siena: Story of a Mediæval Commune* (ib., 1909); Edward Hutton, *Siena and Southern Tuscany* (ib., 1910); F. H. and E. W. Blashfield, "Siena," in *Italian Cities* (new ed., ib., 1912); E. G. Gardner, *Story of Siena*, in "Mediæval Towns Series"

(London, 1913). See SIENESE SCHOOL OF PAINTING.

**SIENA, COUNCIL OF.** A council originally summoned to meet at Pavia by Pope Martin V, as he had promised the Council of Constance, but transferred two months later, because of the plague at Pavia, to Siena, where it sat from July 21, 1423, to March 7, 1424. Owing to the uncertainty of the times, following upon the great schism, it was unable to effect much. It condemned the Wicliffite and Hussite doctrines and took measures for a general suppression of heresy. Before its adjournment Basel was chosen as the place for the next general council. See BASEL, COUNCIL OF.

**SIENA, GUIDO OF.** See GUIDO OF SIENA.

**SIENA, UGOLINO DA.** See UGOLINO DA SIENA.

**SIENESE (sē'en-ēz' or -ēs') SCHOOL OF PAINTING.** The principal Italian school of painting, along with the Florentine, during the later thirteenth and fourteenth centuries. As compared with the Florentine school (q.v.) it was more detailed in finish, brighter in color, and more refined in sentiment, but inferior in line and dramatic action and less naturalistic. It appealed to sentiment rather than understanding; its subjects were the ideals and feelings of the Middle Ages, and it retained more of the Byzantine element than did the Florentine. The determinative factor at Siena was the panel picture, at Florence the fresco. The founder of the Sienese school was Duccio (active 1282-1339), and his greatest follower was Simone Martini, who ranked with Giotto in the estimation of contemporaries. In the course of the fourteenth century the influence of the school of Giotto made itself felt, especially in fresco painting, in the works of the brothers Pietro and Ambrogio Lorenzetti (early fourteenth century). During the fifteenth century the painters of Siena, little affected by the Renaissance, both in style and subject, persisted in the art of the fourteenth. The new school which was founded in the sixteenth century by Sodoma (1477-1549), a pupil of Leonardo, was a transplanting of the Lombard manner into Siena. Its chief representatives were Girolamo della Pacchia, the architect Peruzzi, and Domenico Beccafumi. For a more detailed account, see PAINTING. Consult: Crowe and Cavalcaselle, *History of Painting in Italy* (ed. by Langdon Douglas, New York, 1903); F. H. A. Seymour, *Siena and her Artists* (Philadelphia, 1907); Bernhard Berenson, *Central Italian Painters of the Renaissance* (New York, 1909); the bibliography under PAINTING, Italy.

**SIENKIEWICZ, syën-kyë'väch, HENRYK** (1846-1916). A famous Polish novelist, born in Wola Okrzejska, Government of Siedlce. On graduating from the Realgymnasium at Warsaw he studied philosophy at the university of that city, making his literary début in 1872 with a sketch of Kiev student life entitled *In Pain* and a humorous story, *Nobody is a Prophet in his own Country*. In 1876 he visited California and described his experiences in a series of letters to the *Polish Gazette* (of Warsaw) under the pseudonym Litwos. They attracted much attention by their keen observation, quaint humor, and generally attractive style. His drama, *On a Card* (1879), dealing with the party struggles in Galicia, as well as his stories, *From the Note-Book of a Posen Teacher*, *Hanja*, and *Yanko the Musician*, increased his popularity. In 1880 he produced

the novel *The Tatar Bondage*. Its success induced him to continue work in the same line, resulting in his great trilogy *With Fire and Sword* (1884), *The Deluge* (1886), and *Pan Michael* (1888)—by far the greatest novels dealing with the struggle of the Poles and Cossacks. The characters are often untrue to history, but the power of evoking historical personages and surrounding them with a halo of romanticism places Sienkiewicz's works among the most enjoyable historical novels. His *Without Dogma* (1890), written in the form of a diary, is a study in pathological psychology. *The Children of the Soul* (1894) is a novel of contemporary Polish manners. *Quo Vadis* (1895), repeatedly dramatized, brought its author greater fame than all his previous efforts. He sagaciously saw and fully exploited the dramatic possibilities of the remarkable epoch of Nero's reign for an historical novel. His *Knights of the Cross* (1904) takes the reader back to the time of the struggles between the Poles and the Teutonic Order. Other works are: *Life and Death and Other Legends and Stories* (1904); *On the Field of Glory* (1906); *In Life's Whirlpool* (1910); *In Desert and Woodland* (1911). In 1905 he received the Nobel prize in literature. For many years he was editor in chief of the periodical *Słowo*. His works have been translated into many European languages. Consult W. L. Phelps, *Essays on Modern Novelists* (New York, 1910).

**SIERO, sê-ä'rô.** A town of north Spain, in the Province of Oviedo, situated 10 miles east of Oviedo. There are coal mines in the neighborhood, and the town has considerable manufactures of leather, as well as soap and cloth. Pop., 1900, 22,657; 1910, 25,077.

**SIERRA, syër'rá.** See CERO; SPANISH MACKEREL.

**SIERRA LEONE, sê-ër'rá lê-ô'nê.** A colony and a protectorate of Great Britain on the west coast of Africa. The colony comprises a narrow strip 8 to 20 miles wide along the coast from the Great Scarcies River (the boundary line of French Guinea) to the Mano River (the boundary line of Liberia), including also the islands of Sherbro, Banana, Turtle, Yellaboi, and a number of other islets, having an estimated area of about 4000 square miles (Map: Africa, C 4). The protectorate extends inland for about 180 miles. Area, 27,000 square miles. The coast, much indented, is low and marshy and lined with sand banks and lagoons. Hills rise almost from the shore and soon give way to a plateau (culminating in heights of 3000 to 4000 feet) rising towards the north. The region is well watered and traversed by many streams which flow in a southeasterly course to the Atlantic; then offer, however, but a few miles of navigable way. Sierra Leone has long been known as the "white man's grave" on account of its climate, but this characterization is true only of the low coast region, the interior being less unhealthful. The dry season near the coast lasts from January 1 to the end of March, and the true wet season sets in by May and continues to the end of October. The dry season is characterized by a persistent dry northeast wind. The rainfall is heavy, ranging at Freetown on the coast from about 140 to over 200 inches per annum. The mean annual temperature at Freetown is about 80° F. The principal products are palm kernels and oil, cola nuts, and gum copal. Imports and exports in 1905 were valued at £702,-

649 and £563,150 respectively; in 1913, £1,750,303 and £1,730,952. A government railway runs from Freetown to Pendembu, 227 miles; from Boia Junction (64 miles from Freetown) a branch extends to Makene, 83 miles; and a further extension to Baga has been begun. The Governor is assisted by nominated executive and legislative councils. The capital is Freetown. There are about 105 primary schools, under denominational control, with about 7500 pupils; also a number of Mohammedan schools maintained by the government. Revenue, in 1913, £618,383; expenditure, £622,439; public debt at end of 1913, £1,295,676. The population of the colony proper in 1891 was 74,835; in 1911, 75,572, of whom 702 were white. The population of the colony and protected districts was returned at 1,024,178 in 1901 and at 1,403,132 in 1911. Freetown, which has the best harbor in west Africa, had 34,090 inhabitants in 1911.

The coast of Sierra Leone was discovered by the Portuguese in the fifteenth century and settled by the English in the seventeenth century, but soon abandoned. In 1787 a colony of fugitive slaves was sent there by English philanthropists, who had purchased some territory from the natives. The first attempt having proved unsuccessful, a second settlement was established in 1791, and in 1792 the colony was augmented by 1200 fugitive slaves from Canada and the Bahamas. In 1807 the company transferred its territory to the crown, and in 1896 a British protectorate was declared over the hinterland.

Lukach, *Bibliography of Sierra Leone, with Essay on the Origin, Character, and Peoples of the Colony* (Oxford, 1910); T. J. Alldridge, *Transformed Colony: Sierra Leone as it Was and Is* (Philadelphia, 1910).

**SIERRA MADRE**, mǎ'drǎ. A name borne in common by the two chief mountain ranges of Mexico, which are nearly parallel to either coast and inclose the great central plateau of Anahuac (q.v.). The western range is often called Sierra Madre Occidental or Sierra Madre del Pacífico; the eastern is called Sierra Madre Oriental. They are widely separated in the north, but converge towards the south. A little to the south of Mexico City the intervening plateau is bridged over by the range of lofty volcanoes known as the Cordillera de Anahuac, and farther south the two ranges merge in the mountains of Oaxaca. The western range is continuous and higher and more rugged than the eastern, some peaks rising above 10,000 feet. The lower slopes are grassy; higher up are oaks, while pine forests cover the high ridges. Both ranges consist of granite, with intrusions of basaltic and other volcanic rocks. The system does not seem to be connected with the South American Andes, and structural connection with the northern Rockies has not been clearly shown.

**SIERRA MADRE.** A mountain range extending along the east coast of Luzon (q.v.).

**SIERRA MORENA**, mǎ-rǎ'nǎ. A mountain range, the southern escarpment of the great

Iberian plateau (Meseta) in Spain, forming the boundary between the provinces of Ciudad Real on the north and Jaén and Cordova on the south (Map: Spain, D 3). It rises but slightly above the plateau, its average elevation being about 3500 feet, but on the south it falls in a steep and imposing cliff towards the low valley of the Guadalquivir. The railroad from Madrid to Cordova crosses it through several tunnels in the romantic pass called the Puerto de Despeñaperros.

**SIERRA NEVADA**, nǎ-vǎ'dǎ (snowy range). A mountain range of south Spain, a part of the Andalusian system of crust folds lying between the Guadalquivir and the south coast, extending from the centre of the Province of Granada about 60 miles eastward into the Province of Almería, its crest being about 28 miles from the Mediterranean coast (Map: Spain, D 4). The loftiest summit of the Sierra Nevada and of all Europe outside the Alps is Mulhacén, with an altitude of 11,420 feet, while Veleta rises to 11,385 feet. Eastward it merges gradually into a lower plateau region. It sends out numerous spurs inclosing deep valleys and on the north falls in wild and rocky precipices towards the Jenil River, on whose banks lies the city of Granada. The range consists mainly of mica slate, and, though the low valleys are covered with a rich vegetation, the bulk of the mountain consists of naked rocks. It is covered with snow a great part of the year, and on the Veleta there are permanent glaciers, the southernmost of Europe.

**SIERRA NEVADA**, nǎ-vǎ'dǎ. A mountain range in eastern California, forming the divide between the Great American Basin and the valley of the Sacramento and San Joaquin rivers (Map: California, E 3). It is a tilted plateau 70 to 100 miles wide and extending in a north-northwest direction for nearly 500 miles to Lassen Peak. In the south it turns westward and merges with the Coast Range, and in the north it is continued into Oregon as the Cascade Mountains. It is a range of great geologic complexity, with rocks ranging from Archean to recent times. The rocks are made up of highly compressed schists and slates with large areas of associated igneous rocks, chiefly granite and diabase, upon which lie unconformably a series of later Cretaceous and Tertiary sediments and volcanics. The average elevation of the crest is over 11,000 feet. The range falls abruptly on the east to the valley floor of the Great Basin, 5000 feet below, while on the west it has a wider and more gradual slope. The Sierra Nevada, whose greatest elevation but slightly exceeds that of the Rocky Mountains, appears much more massive and impressive than the latter range, as it rises from a much lower level. The number of peaks, however, is not as great as in Colorado, though there are a number of peaks over 12,000 feet high. The highest peaks are clustered near the southern end, and here Mount Whitney, the highest point in the United States proper, attains an altitude of 14,502 feet. Other high points are: Fisherman Peak, 14,448 feet; Mount Corcoran, 14,093 feet; Mount Kaweah, 13,752 feet; Mount Brewer, 13,886 feet; Mount Lyell, in the Yosemite Park, 13,090 feet. The higher portions show perpetual snow, and the northern slopes of some peaks are occupied by small glaciers. The snowfall is heavy on the western slope and feeds a large number of streams to the Sacramento and San

Joaquin rivers. These streams have cut the slope into deep valleys, some of which, notably the Yosemite valley, are remarkable for their scenery. The Sierra Nevada is covered to a height of 9000 feet with dense coniferous forests, which yield to deciduous on the lower west slope. This slope, above the deciduous zone, is the exclusive habitat of the big trees (*Sequoia gigantea*). Though it is practically an unbroken divide, there are several passes leading across the range at altitudes of 4000 to 7000 feet. Of these the Truckee Pass (5818 feet) in the north and the Tehachapi Pass (3966 feet) in the south are traversed by railroads. Consult: Clarence King, *Mountaineering in the Sierra Nevada* (New York, 1902); John Muir, *Mountains of California* (ib., 1911); id., *My First Summer in the Sierra* (Boston, 1911).

**SIEVERS**, zē'vĕrs, EDUARD (1850- ). A German philologist, born at Lippoldsberg, Prussia. Educated at Leipzig and Berlin, he became assistant professor at Jena in 1871, receiving full professorship in 1876. In 1883 he went to Tübingen, in 1887 to Halle, and was called in 1892 to Leipzig. In 1896 a Festgabe was presented him by pupils and friends. Among the contributions of Sievers to Germanic philology are his editions of *Tatian* (2d ed., 1892), *Heliand* (1878), and *Die althochdeutschen Glossen* (4 vols., 1879-98), in collaboration with Steinmeyer. His original works include *Der Heliand und die angelsächsische Genesis* (1875) and *Angelsächsische Grammatik* (3d ed., 1898; Eng. trans. by A. S. Cook, Boston, 1885; 3d ed., 1903). Among his contributions to metrics are his *Altgermanische Metrik* (1893), *Metrische Studien* (3 vols., 1901-05), and *Amos* (1907), dealing with Hebrew metres, while his *Grundzüge der Phonetik* (5th ed., 1901) is a standard work on phonetics. From 1892 to 1906 he edited Paul and Braune's *Beiträge zur Geschichte der deutschen Sprache und Litteratur* and contributed to Paul's *Grundriss der germanischen Philologie* (Strassburg, 1891 et seq.).

**SIEVERS**, JAKOB JOHANN, or YAKOV YEFIMOVITCH, COUNT (1731-1808). A Russian statesman, born at Wesenberg, Esthonia. He served in the Foreign Office, was Secretary to the Copenhagen and London embassies, and saw active service in the Seven Years' War. Made Governor of Novgorod in 1764 and afterward Governor-General of Novgorod, Tver, and Pskov, he introduced many important reforms. In 1789, after eight years of retirement, he was appointed Ambassador to Poland and was largely instrumental in bringing about the second and third partitions of that country. Recalled in 1794, he lived in retirement until Czar Paul made him Senator (1796). In 1797 he was intrusted with the direction of water communications. The canal he built (1798-1803) between the Volkhov and Msta rivers bears his name. Consult Blum, *Ein russischer Staatsmann: des Grafen Jacob Johann Sievers Denkwürdigkeiten zur Geschichte Russlands* (Leipzig, 1857-58).

**SIEVERS**, WILHELM (1860- ). A German geographer, born at Hamburg. He was educated at Jena, Göttingen, and Leipzig, was made privatdocent at Würzburg in 1887 after extensive travels in Venezuela and Colombia, and became professor at Giessen in 1903. In 1892 he undertook for the Geographical Society of Hamburg further explorations in South America. The following publications bear his name: *Reise in der Sierra Nevada de Santa*

*Marta* (1888); *Allgemeine Länderkunde* (5 vols., 1891-1907); *Zweite Reise in Venezuela* (1896); *Süd- und Mittelamerika* (1903).

**SIEVE VESSELS**. Tubelike elongated cells, characteristic of the phloem (q.v.), placed end

SIEVE VESSELS OF PUMPKIN.

to end and communicating with one another by means of perforated areas (sieve plates) in the walls. See HISTOLOGY; WOOD.

**SIEYÈS**, sē'ā'yās', EMMANUEL JOSEPH, COUNT (1748-1836). A French revolutionary leader and publicist, generally known as the Abbé Sieyès. He was born at Fréjus and was educated at Paris with the Church in view. He was made a canon in Brittany (1775) and later transferred to the cathedral of Chartres, becoming diocesan chancellor and vicar-general. He had liberal opinions on all social and political matters, and in 1789 he issued his famous pamphlet entitled *Qu'est-ce que le tiers-état?* This work, which claimed political recognition for the people, obtained immense popularity and procured his election as Deputy to the States-General from Paris. Through his urgency and influence the representatives of the people took the decisive step of constituting themselves into an independent body, on June 16, 1789, and became the National Assembly. In this body Sieyès figured prominently. In 1790 he was elected its President. By this time bolder and fiercer spirits had passed him in the race for power, and in the Convention of 1792 he refrained from active participation in the debates, and at the King's trial he recorded a silent vote for death without appeal to the people. While Robespierre and his party were in power, he left Paris. On the fall of Robespierre he returned to the Convention, resuming active interest in affairs, becoming a member of the Council of Five Hundred. He was engaged chiefly in the Department of Foreign Affairs and went in 1798 as Ambassador to Berlin to secure the neutrality of Prussia. He became a member of the Directory in 1799 and succeeded in closing the celebrated Jacobin Club. Perceiving that a dictator was needed in France, he sought the coöperation of some powerful military leader, and on Bonaparte's return from Egypt Sieyès entered into a league with him, the result of which was the revolution of the 18th Brumaire (Nov. 9, 1799)

and the institution of the provisional Consulate, Sieyès, Napoleon, and Roger Ducos being the three consuls at first. Sieyès and Napoleon differed irreconcilably as to the distribution of power, but Sieyès gave way and finally retired. He received 600,000 francs, the estate of Crosne, and a seat in the Senate. The title of Count of the Empire was conferred upon him. Banished at the second Restoration as a regicide, he went to Brussels and did not return to France till after the revolution of 1830, when he was elected a member of the Academy. His *Reconnaissance et exposition des droits de l'homme et du citoyen* (Paris, 1789) undoubtedly led up to the Declaration of the Rights of Man. His constitution is explained in Boulay, *Théorie constitutionnelle de Sieyès* from the *mémoires inédits* of Sieyès (Paris, 1836). Consult: F. A. L. Mignet, in *Notices et mémoires historiques*, vol. i (Paris, 1843); Edmond de Beauverger, "Etude sur Sieyès," in *Tableau historique du progrès de la philosophie politique* (ib., 1858); Bignon, *Sieyès* (ib., 1873); A. Neton, *Sieyès, 1746-1836, d'après des documents inédits* (ib., 1900); *Cambridge Modern History*, vol. viii (New York, 1904).

**SIFBLEUR**, sé'flér'. See WHISTLER.

**SIFTON**, ARTHUR LEWIS (1858-1921). A Canadian statesman, born at St. John's, Ontario, and educated at Wesley College, Winnipeg, and at Victoria University, Cobourg. He went to the Canadian Northwest in 1875, was admitted to the bar in 1883, and was a member of the Legislature of the Northwest Territories in 1899-1903. After serving as treasurer and later as Commissioner of Public Works in the administration of Frederick William (later Chief Justice) Haultain, he was Chief Justice of the Supreme Court, Northwest Territories (1903-05); from the organization of the Province of Alberta, in 1905, till 1910 he was Chief Justice of its Supreme Court; and in 1910 he became Liberal Premier of Alberta, holding also the offices of Provincial Treasurer and Minister of Public Works.

**SIFTON**, SIR CLIFFORD (1861- ). A Canadian statesman, born in Middlesex County, Ontario, and graduated at Victoria University, Cobourg, in 1880. Removing to Manitoba, he was called to the bar in 1882 and practiced his profession at Brandon. He was a Liberal member of the Manitoba Legislature (1888-96), and in 1891-96 was Attorney-General in the administration of Thomas Greenway (q.v.). Sifton was one of the most prominent opponents of the Manitoba remedial measure by which the Dominion government sought to establish separate schools in Manitoba (q.v.). In 1896-1911, while Minister of the Interior in the Laurier administration, he formulated the immigration policy whereby Canada received an influx of settlers unprecedented in its history. Differing with Sir Wilfrid Laurier in 1911, he resigned his office and opposed the Taft-Fielding reciprocity agreement. In 1903 he was British Agent before the Alaskan Boundary Tribunal and in 1910 was appointed chairman of the Royal Canadian Conservation Commission. In 1915 he was knighted (K.C.M.G.).

**SI-GAN-FU**. See ST-NGAN-FU.

**SIGEBERT OF GEMBLoux**, sēzh'bar' ov zhān'blōs' (c.1030-1112). He was born in Brabant and spent almost the whole of his life at Gembloux. He is "the best of the universal chroniclers of the Middle Ages," and his works had an extraordinary vogue. Of his numerous

writings the best known is his *Chronographia*, or chronicle from 381 to 1111 A.D. The best edition is in the *Monumenta Germaniae Historica*, vol. vi. Consult Auguste Molinier, *Les sources de l'histoire de France* (6 vols., Paris, 1902-06), passim.

**SIGEL**, sē'gel, FRANZ (1824-1902). A German-American soldier, born at Sinsheim in Baden. In 1848 he took a prominent part in the revolutionary movement in Baden and on the renewed outbreak of the insurrection, in the spring of 1849, commanded the troops on the Neckar. In May he was made a member of the provisional government and Minister of War; later he became Mieroslawski's adjutant general and then leader of the revolutionary forces, conducting their retreat into Switzerland. In 1852 he emigrated to the United States. On the outbreak of the Civil War he espoused the side of the North and organized a regiment of infantry and a battery of artillery. In 1861 he was defeated in the battle of Carthage, though conducting a successful retreat; later he took part in the battle of Dug Springs and, after the death of General Lyon at Wilson's Creek, again led an orderly retreat. He was made a brigadier general of volunteers and at the battle of Pea Ridge in 1862 gained the day by a spirited charge. He was then promoted major general of volunteers and was placed in command of Harper's Ferry. He commanded the First Corps in the campaign which terminated with the second battle of Bull Run, and in 1864 was given command of the Department of West Virginia. The same year he led an expedition into the Shenandoah valley, but in May was defeated at New Market by General Breckenridge and was relieved of his command by General Hunter. In the following July he successfully defended Maryland Heights against General Early, but the administration had lost confidence in him, and he was relieved of command. He resigned from the army in 1865. In 1869 he removed to New York City, was register thereof in 1871-74 and United States pension agent in 1886-89. For several years he published the *New York Monthly*, a German-American periodical.

**SIGERSON**, sij'er-son, GEORGE (1839-1925). An Irish scholar, poet, and scientist, who took up the work of James Mangan (q.v.), and prepared the way for the Celtic revival of the early twentieth century. He was born at Holyhill, County Tyrone, and studied medicine in Paris. His medical and other scientific works brought him recognition at home and abroad, notably from Darwin and Tyndall, the latter praising especially his *Microscopic Researches on the Atmosphere* (1873). He was appointed professor of botany at the Catholic University and later of zoölogy at University College, Dublin. He wrote also soundly and competently on history, on the Irish land question, and on the care of prisoners; and he was a trenchant leader writer, as his contributions to the *Irishman*, the *Nation* (Dublin), and the *Harp* attest. For a time he served as president of the National Literary Society, Dublin. It is probably as a translator of Gaelic poetry and as a poet on his own account that he will be longest remembered. In these fields his publications include: *The Poets and Poetry of Munster* (2d series, 1860, with metrical translations), signed Erionnach; *Bards of the Gael and Gall* (1897: new ed., 1907); and the selections in *The Treasury of Irish Poetry* (1900), edited by Stopford Brooke and T. W.

Rolleston (qq.v.). He is among the Irishmen introduced, often satirically, in George Moore's *Hail and Farewell* (3 vols., New York, 1911-13). See IRISH LITERATURE, *Irish Literature in English*.

**SIGEUM**, DAMASTES OF. See DAMASTES OF SIGEUM.

**SIGHT** (AS. *ge-sihþ*, OHG. *ge-siht*, Ger. *Ge-sicht*, from AS. *sċon*, OHG. *sehan*, Ger. *sehen*, to see; connected with Lat. *sequi*, Gk. *ἑπεσθαι*, *hepesthai*, Lith. *sekti*, Skt. *sac*, to follow), DEFECTS OF. Under this head may be considered certain affections of the eyesight due to some known or unknown peculiarity of the optical apparatus (including the optic nerve), as nearsightedness, farsightedness, double vision, color blindness, night blindness, and day blindness. Defects due to errors of refraction include the first two of these.

Nearsightedness, shortsightedness, or myopia is often popularly confounded with dim or weak sight; but in reality short sight applies exclusively to range and not to power of sight, and a shortsighted person may possess acute power of vision for near objects. In this affection rays which ought to come to a focus upon the retina converge to a point more or less in front of it. Its cause probably differs in different persons, but it generally arises from elongation of the globe in its anteroposterior diameter, more rarely from increased curvature of the cornea, increase in refractive power of the lens in the early stage of senile cataract, or from an imperfect power of the eye to adjust itself to various distances. The distance at which objects are perceived most distinctly by the perfectly normal eye ranges from 16 to 20 inches; an eye which cannot perceive objects distinctly beyond 10 inches may fairly be regarded as shortsighted; and in extreme cases the point of distinct vision may be 3, 2, or even only 1 inch from the eye. There is frequently an hereditary tendency to nearsightedness, but it is rarely congenital. It is often acquired by excessive use of the eyes at an early age for reading or other near work, or overstudy under unfavorable circumstances and poor health. As a general rule the inhabitants of towns are much more liable to it than persons living in the country, and students and literary men are most liable of all. The frequency of myopia in the cultivated classes points directly to its principal cause—tension of the eyes for near objects. Prolongation of the visual axis is attributed to (1) pressure of the muscles on the eyeball in strong convergence of the visual axis; (2) increased pressure of the fluids resulting from accumulation of blood in the eyes in the stooping position; (3) congestive processes in the base of the eye, which, leading to softening, give rise to extension of the membranes; (4) the shape of the orbit in broad faces, causing excessive convergence, trouble occurring especially in such persons. That in increased pressure the extension occurs principally at the posterior pole is explained by want of support there from the muscles of the eye. Also, the injurious effect of fine work is, by imperfect illumination, still more increased; for thus the work must be brought closer to the eyes, and the stooping position of the head, particularly in reading and writing, is increased. Hence it is that in badly lighted schoolrooms the foundation of myopia is often laid. On the contrary, in watchmakers, although they sit the whole day with a magnifying glass in one eye, we observe no development of myopia,

undoubtedly because they fix their work with only one eye and therefore converge but little.

Shortsightedness is often a progressive affection. Those cases in which myopia develops slightly in young persons and practically becomes arrested are called simple or stationary myopia. Progressive myopia is the form which increases steadily with degenerative changes in the choroid and other deep structures. Persons with uncorrected myopia of any severity have a characteristic vacant expression from inability to see other than near objects.

In the treatment of myopia the principal objects are: (1) to prevent its further development and the occurrence of secondary disturbances; and (2), by means of suitable glasses, to render the use of the myopic eye easier and safer. (1) To effect, if possible, the first object, the patient must look much at a distance, but, as we cannot absolutely forbid his looking at near objects, spectacles must be provided which render vision distinct at from 16 to 18 inches. Moreover, it is desirable that at intervals of a half hour work should be discontinued for a couple of minutes, and no working in a stooping position should be permitted. The patient should read with the book in the hand, and in writing should use a high and sloping desk, with good but not too strong light from behind. If the myopia increases, work should be replaced by outdoor life. (2) The optical remedy for short sight obviously consists in concave glasses of a focus suited to the individual. At first sight it might be supposed that glasses with a concavity exactly sufficient to neutralize the defect in the eye would always suffice; and when the glasses are used exclusively for distant vision, or when the affection is slight and the eye is otherwise healthy, perfect neutralization is admissible; but many require different glasses for distance and reading. An oculist should always be consulted as to the choice of spectacles. Glasses, if injudiciously selected, usually aggravate the evil they are intended to remedy.

Farsightedness, hyperopia, or hypermetropia is an error of refraction in which parallel rays are brought to a focus behind the retina, usually on account of shortening of the eyeball, sometimes from diminished convexity of cornea or lens, absence of the lens (*aphakia*), or changes in the refractive index of the media. It is more common than myopia, is congenital and often hereditary. As the hyperopic eye is obliged to accommodate for parallel rays, it is constantly strained unless corrected by proper convex glasses. If uncorrected it leads to symptoms of asthenopia or eyestrain, frontal and occipital headaches, pain in the eyes, congestion and burning sensations in the lids and eyeballs.

Presbyopia (from the Greek words *πρεσβυς*, *presbys*, an aged person, and *ὄψ*, *ops*, the eye), or old sight, is a change which naturally occurs in every eye between the fortieth and forty-fifth year. On account of loss of elasticity of the lens the power of accommodation is diminished. The stated time for the occurrence of presbyopia has been arbitrarily fixed, as that is the period at which the nearest point to the eye at which ordinary print can be easily read has receded to 9 inches and some discomfort is experienced. The near point really begins to recede at 10 years of age and continues to do so through life. If uncorrected there is difficulty in reading, blurring of print, and symptoms of eyestrain as in hyperopia. Correction is secured by convex

spherical glasses, which bring the near print to a comfortable distance with respect to the person's occupation. Allowance must be made for coexisting myopia, hyperopia, or astigmatism, and the strength increased at intervals.

Double vision, or diplopia, may arise from a want of harmony in the movements of the two eyes due to imperfect functioning of the external muscles of the eyes. In squinting (see STRABISMUS), the vision of the most distorted eye is almost always imperfect. Impressions on the two retinae are similar in kind but dissimilar in form. The mind takes cognizance only of the former, so that a person with a pronounced squint sees objects with the sound eye only. But if the sight of both eyes is nearly equal, as often is the case when the squint is slight, double vision results whenever both eyes are employed together, in consequence of images of nearly equal intensity falling on noncorresponding parts of the two retinae. This variety of double vision can be corrected by suitable glasses.

Color blindness is noticed under its own name. Night blindness, or nyctalopia (from the Greek, signifying "night sight"), is a peculiar form of intermittent blindness, the subjects of which see perfectly with an ordinary light, but become entirely and almost instantaneously blind as soon as twilight commences. The most probable cause of the affection is exhaustion of the power of the retina from the overexcitement of excessive light, so that this organ is rendered incapable of appreciating the weaker stimulating action of twilight or moonlight. Snow blindness must be regarded as an allied affection to the preceding. Day blindness, or hemeralopia (from the Greek, signifying "day sight"), refers to the condition in which the sight is better in a feeble light, as at dusk, than in bright light. This occurs in amblyopia (q.v.) from overuse of tobacco, and in cases in which there is defective vision of the central portion of the visual field. For example, if there is an opacity of the central portion of the lens or cornea, the dilatation of the pupil which takes place in a feeble light allows the person to see through the unobstructed portion of the cornea or lens surrounding the opacity. Colored vision sometimes occurs either with or without retinal changes. Red vision, erythropsia, may come after extraction of a cataract. Xanthopsia, or yellow vision, may follow the ingestion of santalin, gelsemium, digitalis, chromic and picric acids, and amyl nitrate. Cantharis indica sometimes causes violet vision. Red or blue vision may result from use of iodoform, and cocaine has caused colored vision. Phosphorus is said to cause sparks and flashes of light, and the same is said to occur with belladonna and antonin.

Other defects of sight are described under AMAUROSIS; AMBLYOPIA; ASTHENOPIA; ASTIGMATISM; HEMIOPIA; HETEROPHORIA. See VISION. SIGHT, SECOND. See SECOND SIGHT.

**SIGHTS.** The mechanical or optical means of determining when the axis of the gun has the predetermined direction with respect to the line from the gun to the target. The line of sight is an imaginary straight line drawn in continuation of two points of the sight system. It may be fixed in one of two ways. First, by means of two plain or open sights, and second, by means of a telescope, provided with cross hairs, called the reticule.

The open sight is generally not used except on small arms, although large cannon are generally

provided with it in addition to the telescope for use in case the latter should become damaged. Similarly telescopic sights are in some cases fitted to small-arm rifles, but generally only for the use of expert marksmen. The principles and uses of the open sight may be learned by examining the open sight as used on the United States magazine rifle. This sight is to all intents the same for the rifles of all countries.

A rifle or gun, to enable the bullet or projectile to reach a certain target, must be given a certain elevation over a line drawn from the gun to the target, and must also be given a certain deviation. The amount of elevation depends on the distance to the target and the weight and velocity of the bullet. A deviation correction is needed, since the rotational velocity of the bullet, imparted to it by means of the rifling, gives it a certain amount of drift. In addition to the above, additional corrections must be made for variations in atmospheric conditions, wind, etc.

SIGHTS, UNITED STATES SPRINGFIELD RIFLE (1906 MODEL).

The purpose of the sight is to insure that, when it is correctly set, the gun shall have the correct direction with respect to the line of sight, so that when the line of sight is on the target the projectile will pass through the target.

In pistols and revolvers, where short-range firings are the rule, the sights consist of a notch placed near the rear end and a foresight near the muzzle. For these, corrections for elevation and deviation are not required or provided. In military rifles, however, adjustment must be given to enable the aim to be accurately taken at any range up to 2900 yards. Military sights are all variations of one general type and usually consist of a leaf either lying flat or hinged upon a bed or block fixed to the barrel. The leaf must be raised to secure additional elevation, the distance being regulated by a sliding bar, in the centre of which a notch has been cut, through which the sight is taken over the tip of the foresight.

Automatic correction for drift, which increases with the range, is accomplished by the slide moving in grooves in the leaf. These grooves are cut such that, as the slide is raised, it is also carried to the left. A windage screw is also provided, which is located at the front end of the sight base and by means of which the entire sight is shifted sideways to correct for varying velocities of side winds. Lateral adjustment is

rarely necessary at the distances at which sporting rifles are used. Sportsmen sometimes employ a foresight of the covered bead variety or the ivory or copper sight used by African hunters. The Boers, who rank high as practical marksmen, employ the ivory foresight, but Euro-

giving of direction of the gun into two distinct parts, viz., that of giving the gun the proper elevation for the range and that of giving it the proper direction.

The elevation is given the gun by means of an instrument, generally located on the right side and called the quadrant. This instrument is provided with a range drum so connected to an arc pivoting about a centre that, when the drum is set at the proper range and the level attached to the arc is leveled by moving the gun about its trunnions, the gun will have the proper elevation for the range set on the drum, provided the target is on the same level as the gun. If, however, the target is above or below the level of the gun, the elevation of the gun must be increased or decreased by the angular amount the target is above or below, which amount is called the angle of

TELESCOPIC SIGHT USED ON SEACOAST CARRIAGES.

pean and American sportsmen who have engaged in African or big-game shooting generally use the copper sight. Various forms of rear sight are in use, perhaps the best of which is the platina bar on a more or less open V. Another favorite type is the platina pyramid, which is set below a very open V. Telescopic sights are affixed to sporting rifles and have been found very successful in deerstalking or any form of hill and mountain hunting where game is difficult to locate. See RIFLE, HUNTING.

Sights for cannon are in principle the same as sights for rifles. Owing to the different conditions existing, however, a different method is generally employed. The two methods employed in giving large field or seacoast guns the proper direction are method of direct laying and that of indirect laying. Direct laying, the method for rifles, is employed for large guns where the target is in view of the gunner. It is used in naval target practice and to a certain extent in seacoast firings. It may be used for field-artillery fire in cases where the guns are not placed behind covers. On account of the long ranges generally fired at, telescopic sights are generally used, but in any case the graduations and settings of the sights are such that, when they are correctly set and the line of sight is pointing at the target, the line of the axis of the bore of the gun is such that, considering the range, drift, wind, and atmospheric conditions, the projectile will pass through the target.

It is evident that, where the target is concealed either by being placed behind cover or by the gun itself being behind cover for protection, direct laying cannot be used. For such a condition the method of indirect laying is employed. This is the condition generally prevailing in field-artillery fire, and the method of indirect laying is therefore generally the one employed. This method consists in separating the

site of the target. To give the gun this additional elevation, whether positive or negative, the quadrant, instead of having the level mounted directly on the range drum arc, has it mounted on an auxiliary arc, which arc is set to a predetermined setting corresponding to the angle of site of the target.

The proper direction of the gun is given by the panoramic sight on the left side. The objective of this sight is mounted in a hood which can be rotated in a horizontal plane. It is set by using a graduated arc so that, when pointed at a selected visible aiming point, the horizontal angle between the direction of the line of sight, when parallel to the axis of the bore, and its direction when pointing at the aiming point is the same as the angle between the aiming point, gun, and target. This angle is determined by a rapid triangulation by the battery commander.

The unit of graduation used in the United States and many European countries is the mil.

GUNNER'S QUADRANT (UNITED STATES 3-INCH FIELD GUN).

A mil is  $1/6400$  of a circumference, and a mil of arc is approximately  $1/1000$  of the radius or range. This is convenient in many respects in fire control, since it offers, e.g., an easy means of determining the angular difference there must be between the settings of two guns of a battery when aiming at the same aiming point, but

shooting at different parts of the target. For example, for a target having a front of 100 yards and located 5000 yards, there must be a difference of 20 mils between the panoramic sight readings for two guns placed side by side

REAR SIGHT FOR UNITED STATES 3-INCH FIELD GUN.  
PANORAMIC SIGHT FITS IN SLOT AT TOP.

and aiming at the same aiming point and firing at each end of the target.

The independent line of sight is a peculiar construction used on field-artillery guns to increase the rapidity of setting. It consists in placing an intermediate carriage between the gun and the carriage proper. The means for giving direction is placed on the intermediate carriage, which is always kept level, while the elevation of the gun is measured between this leveled intermediate carriage and the gun proper.

For direct laying the intermediate carriage may be inclined equal to the angle of site of the target by aiming through the panoramic sight and elevating it until the line of sight passes through the target. For indirect laying the intermediate carriage is leveled, and the difference in elevation of the gun and the intermediate carriage is then the elevation required for the range increased algebraically by the angle of site of the target.

The reason for the resultant increase of speed with the independent line of sight is that, no matter how often and how much the elevation of the gun is changed, the direction or setting of the panoramic sight is not changed, since the latter is fixed to the intermediate carriage, which is always kept level. For the dependent line of sight the panoramic sight with sight shank must be raised in its seat, when the elevation of the gun is changed in order to retain the hood horizontal.

The independent line of sight was used in the French 75-millimeter field gun, employed with great success during the Great War. No other country, however, had adopted it previous to that time. It was adopted generally on new equipment procured by various countries. Italy was using it on their new gun, of the Deport

split-trail type, and the new model United States field gun was to be provided with it. A somewhat different construction for the independent line of sight is used in Krupp carriages. In this the panoramic sight is geared to the elevating mechanism of the gun in such a way that, as the gun is elevated, the screw carrying the sight is extended, so that the hood of the panoramic sight is at all times kept level.

The guns of seacoast fortifications are generally aimed for direction by direct laying, while elevation is given them by moving the gun about its trunnion until the proper range is read off on the range disks. It may be aimed entirely by a method of indirect laying, in which case the elevation is set off as before, while the deflection is given to it by traversing the entire carriage until the proper deflection reading is read off on the azimuth circle fixed permanently in place. This deflection is determined by plotting the movement of the target from two towers located a certain known distance apart. Consult: H. G. Bethell, *Modern Guns and Gunnery* (Woolwich, 1910); British Army, *Handbook of Artillery Instruments* (London, 1914); O. M. Lissak, *Ordnance and Gunnery* (New York, 1914); Ommun-sen and Robinson, *Rifles and Ammunition, and Rifle Shooting* (ib., 1915); United States Naval Academy, *Naval Ordnance: A Text Book* (rev.

INDEPENDENT LINE OF SIGHT AS MADE BY KRUPP.

ed., Annapolis, 1915). See COAST ARTILLERY; FIELD ARTILLERY; HUNTING; ORDNANCE; RIFLE, HUNTING; SMALL ARMS; ETC.

**SIG'ILLA'RIA** (Neo-Lat. nom. pl., from Lat. *sigillum*, seal). An extinct genus of lycopods that flourished during the Carboniferous period, conspicuous in the swamp flora. They were often trees of great height. Both branches and trunk were crowded with sword-shaped leaves arranged in spiral series. See LEPIDODENDRON; STIG-MARTA.

**SIGISMUND**, sîj'is-münd, Ger. pron. zê'gès-munt (1368-1437). Holy Roman Emperor from

1411 to 1437. He was the second son of the Emperor Charles IV, whom he succeeded in 1378 in the Margraviate of Brandenburg. In 1374 he was betrothed to Mary, heiress of Louis the Great, King of Hungary and Poland, and in 1387 succeeded to the Hungarian crown. In 1396 he undertook a crusade against the Turks supported by a large force of French and German knights, but at Nicopolis, September 28, he suffered defeat at the hands of Bajazet I. In 1401 a formidable uprising drove him from the throne, but he was restored by hired troops and seems henceforth to have ruled with wisdom and moderation. He waged wars to extend the power of Hungary over Bosnia, Dalmatia, and Serbia, but, although success at first attended his efforts, Venetians and Turks checked him. He was elected Holy Roman Emperor in 1411 and was crowned at Aix-la-Chapelle in 1414. He now appears in his most celebrated rôle as the author and protector of the Council of Constance and the guiding spirit in its deliberations. He brought about the deposition of Pope John XXIII and showed himself zealous in the course of thorough ecclesiastical reform. Much obloquy, however, has attached to him for his desertion of John Huss (q.v.), whom he granted a safe conduct for the purpose of attending the council and then allowed to be burned at the stake. In 1419, on the death of his brother Wenceslas, the crown of Bohemia fell to Sigismund. But the Hussites (q.v.) were already in arms, and the country became the theatre of a long conflict, in which the forces of Sigismund and the crusading armies of Germany met with terrible defeats. It was not until 1436 that Sigismund was recognized as King of Bohemia. He visited Italy in 1431 and 1433, receiving the Lombard crown at Milan and the Imperial crown at Rome. He died at Znaim, Dec. 9, 1437, the last of the house of Luxemburg. He was gifted, kindly, and sincerely concerned for the welfare of the Empire, but failed from the defects of an amiable and pleasure-loving disposition. Consult: J. G. Aschbach, *Geschichte Kaiser Sigismunds* (4 vols., Hamburg, 1838-45); Eberhard Windecke, *Denkwürdigkeiten zur Geschichte des zeitalten Kaiser Sigismunds* (Berlin, 1893); A. Main, *The Emperor Sigismund* (London, 1903); Otto Schiff, *Kaiser Sigismunds italienische Politik* (Frankfort, 1910).

**SIGISMUND I** (1407-1548). King of Poland from 1506 to 1548, called **THE GREAT**. He was the youngest son of Casimir IV and succeeded his brother Alexander as King of Poland and Grand Duke of Lithuania. In 1508 Sigismund gained a brilliant victory over the Russians at Orsha on the Dnieper. Bogdan, voivode of Moldavia, was reduced to submission, and the Tatars were severely punished. Subsequent invasions of the Muscovites were repelled, and a rebellion of the Wallachs was defeated. A war with the Teutonic Knights ended in 1525 by the Treaty of Cracow, in which the Grand Master Albert, Sigismund's nephew, was recognized as Duke of Prussia, which was to be held as a fief of Poland. In 1526 Sigismund aided Hungary against Solymán the Magnificent, and a force of Polish cavaliers fought bravely at Mohács. An important event of Sigismund's reign was the introduction and extension of Lutheranism in Poland. He died at Cracow, April 1, 1548, and was succeeded by his son **SIGISMUND II AUGUSTUS** (1548-72), who continued the tolerant policy of his father and effected the permanent union

of Lithuania and Poland at the Diet of Lublin (1569). He was the last of the male line of the Jagellons. See **JAGELLONS**; **POLAND**.

**SIGISMUND, JOHN**. See **JOHN SIGISMUND**.

**SIGISMUNDA**, sē'jēs-mun'dā. The heroine of one of the most widely known tales in Boccaccio's *Decamerone*.

**SIGMARINGEN**, zēk'mā-rīng-en. A line of the elder or Swabian branch of the house of Hohenzollern (q.v.).

**SIGMA XI**. A college honorary scientific fraternity. The growth of scientific studies in the universities in America led in 1886 to the organization at Cornell University, Ithaca, N. Y., of an honorary fraternity to which the name Sigma Xi was given, being the initials of the two Greek words Σπουδῶν Συνάγες, signifying "companions in zealous research." The Sigma Xi bears the same relation to original research as the Phi Beta Kappa (q.v.) Society does to literary scholarship.

The object of this society is to encourage original investigation in science, pure and applied: by meeting for the discussion of scientific subjects; by the publication of such scientific matter as may be deemed desirable; by establishing fraternal relations among investigators in the scientific centres; by granting the privilege of membership to such students as have, during their college course, given special promise of future achievement.

There were, in 1915, 30 chapters in as many colleges or schools, as follows: Cornell (1886), Rensselaer (1887), Union (1887), Kansas (1890), Yale (1895), Minnesota (1896), Nebraska (1897), Ohio (1898), Pennsylvania (1899), Brown (1900), Iowa (1900), Stanford (1901), California (1902), Columbia (1902), Chicago (1903), Michigan (1903), Illinois (1903), Case (1904), Indiana (1904), Missouri (1905), Colorado (1905), Northwestern (1906), Syracuse (1906), Wisconsin (1907), Washington State (1907), Worcester Polytechnic (1908), Purdue (1909), Washington University (1910), District of Columbia (1915), University of Texas (1915).

The society admits as active members resident professors, instructors, graduate students, and undergraduates of both sexes; as alumni members former active members and any graduate of the institution of not less than five years' standing; and as honorary members scientific workers who have achieved eminence in some work of pure or applied science. The number of undergraduates elected during any one year may not exceed one-fifth of the senior class in the scientific and technical courses. The total membership in 1915 was 9045, of which 2292 were active members.

The badge is a watch-chain pendant or charm, consisting of the monogram formed in gold of the Greek letter Sigma, superimposed upon the Greek letter Xi, the former being somewhat smaller than the latter. The colors of the society are electric blue and white.

A general convention consisting of three delegates from the various chapters and the council (which acts as the executive committee of the society and is composed of the general officers and a member elected by each chapter from its active members) meets annually, at the same time as the American Association for the Advancement of Science.

In 1913 the society issued the *Sigma Xi Quarter Century Record and History, 1886-1911*, com-

piled by Henry B. Ward (Urbana, Ill.), and since March, 1913, has published the *Sigma Xi Quarterly* (ib.).

**SIGMOID FLEXURE.** See **INTESTINE; RECTUM.**

**SIGNAL CORPS, UNITED STATES ARMY.** A branch of the army charged with the collection and transmission of military information. It provides the means of transmission of information not only for the army on a peace footing, but must be prepared to supply in case of war a force many times larger; it is required to build and maintain field and garrison lines of telegraph, buzzer, and telephone, to establish and operate at all times fixed radio stations, to devise and use radio apparatus for the field, to supervise the manufacture of and to lay and operate submarine cables, to manage cable ships, to maintain and use field companies for tactical purposes, to organize telegraph companies for practical use, to build up the aeronautical organization for the army, to maintain the fire-control communication system at coast defenses. See **SIGNALING, MILITARY.**

The United States army is the only army maintaining a separate corps for the collection and transmission of information. In France these duties are performed by the technical troops known as Engineers; in Germany, by the Engineers, subdivided as pioneer troops and communication troops; in England, signal duties are assigned to the Royal Engineers. In European armies military aeronautics are, as a rule, in charge of a separate corps. In the United States aeronautics is only one of the many duties of the Signal Corps.

**History.** The Signal Corps of the United States army dates officially from the appointment of Major Albert J. Myer in 1860 as chief signal officer. His system of military signals by means of flags was an improvement upon the semaphore telegraph, used since 1790 in Europe and to a slight extent in America. The Signal Corps received a separate and systematic organization by Act of March 3, 1863, and its members served efficiently on all fields of battle and even on naval vessels. At the close of the war it was again reorganized by Act of July 28, 1866, but in a very unsatisfactory manner, and a school of instruction was established at Fort Whipple, now Fort Myer, near Washington, D. C. By Act of Congress, Feb. 9, 1870, the Secretary of War was authorized to provide for the taking of meteorological observations throughout the country and for the prediction of storms; he assigned this to the chief signal officer of the army. It became apparent that the meteorological work was more important than the military work and that it could be well done by civilian organization. Therefore, on July 1, 1891, an Act of Congress took effect by virtue of which a Weather Bureau (q.v.) proper was organized in the Department of Agriculture and all the men and the duties relating thereto were transferred to it from the War Department. On the other hand, the Signal Corps of the United States army was at the same time reorganized so as to contain 10 commissioned officers and 50 enlisted men as sergeants.

**Strength.** The Signal Corps of the United States army consists of a chief signal officer with the rank of brigadier general, 1 colonel, 2 lieutenant colonels, 6 majors, 18 captains, 18 first lieutenants, 36 master signal electricians, 132 signal sergeants (first class), 144 sergeants,

156 corporals, 24 cooks, 552 privates (first class), 168 privates; total commissioned, 46; total enlisted, 1212; aggregate, 1258. In addition to the above strength 30 officers of the line are detailed to the aviation service under the provisions of the Act of Congress approved March 2, 1912. A 35 per cent increase of pay and allowances is given such of these officers as are actual flyers of aeroplanes. The aviation service is administered by the Signal Corps.

**Duties.** The chief signal officer is charged with the direction of the Signal Corps of the army; with the control of the officers, enlisted men, and employees attached thereto; with the construction, repair, and operation of military telegraph and telephone lines and cables, field telegraph lines, radio installations, balloon trains, and all other military aeronautics, and electrical communication for fire-control purposes; with the preparation, distribution, and revision of the War Department telegraphic code; with the supervision of such instruction in military signaling and telegraphy as may be prescribed in orders from the War Department; with the procurement, preservation, and distribution of the necessary supplies for the Signal Corps and for the lake and seacoast defenses. He has charge of all military signal duties and of books, papers, and devices connected therewith, including telegraph and telephone apparatus and the necessary meteorological instruments for target ranges and other military uses; of collecting and transmitting information for the army by telegraph or otherwise, and all other duties pertaining to military signaling.

The Signal Department furnishes all military posts and seacoast-defense stations with such instruments and materials as may be necessary for the electrical installation of range finders and the fire-control system for the purpose of intercommunication. This includes telephonic and telegraphic instruments, radio stations, electrical clocks, megaphones, field glasses, telescopes, and necessary meteorological instruments, i.e., barometers, thermometers, anemometers, etc.; also all such cable and land lines as may be required to connect contiguous military posts, or for connecting the posts with the commercial telegraph system.

**Organization.** In addition to its functions as an administrative and supply bureau of the War Department, the Signal Corps, with its existing personnel, provides the following tactical units for service in the field with the mobile army: (1) field companies, using the buzzer, the telephone and radio, with 4 officers, 96 enlisted men, 4 wire carts, each carrying 5 miles of field wire for use with the buzzer; 2 instrument wagons and 1 kit wagon; 2 field wagons, each carrying 10 miles of wire as a reserve; 85 saddle horses, 8 draft horses, and 20 draft mules. The field radio installation is carried by 8 pack mules. Field companies are designed primarily for combat purposes and for use in deployments. Equipped with both wire and wireless (radio) outfits, they were found of great practical use in maintaining communication along the Mexican border (1913-15). The radio pack set can be put in operation in two minutes, weighs 370 pounds, and under service conditions has a range of 25 miles. To the present field company is frequently added a wagon or motor radio set having a range of 200 miles. The peace organization in 1915 was 5 field companies. (2) Telegraph companies, having the duties of establishing semi-

permanent telegraph and telephone lines, installations in permanent camps or cantonments, and constructing and maintaining telephone systems for the mobile divisions. This company, established by War Department orders in September, 1913, supplements the field company and takes its place whenever permanent communications are to be maintained. The company consists of six sections—three equipped for camp telephone work, three for field telegraph work. It has a personnel of 4 officers, 139 enlisted men. It is equipped with enough wire to run about 125 miles of line and to establish 60 telephone and 10 telegraph stations. On account of lack of personnel only one of these companies was organized in 1916. Two field companies form a battalion, commanded by a major with necessary staff. In war one such battalion is attached to each division of the mobile army. In the same way two telegraph companies are combined to form a battalion which is assigned to duty in the zone of line of communications and in the service of the interior. (Consult *Tables of Organization, United States Army, 1914*.) (3) Aviation organization, 1916. A number of officers and enlisted men, detailed for aviation service, are assembled at advantageous points for instruction in the art of flying. The proposed organization under trial in 1916 was as follows: for each tactical division of the mobile army, an aërosquadron, commanded by a major, consisting of two aëro companies, each company organized with 9 officers, 39 enlisted men, and 4 aëroplanes, with necessary transportation. See ARMY ORGANIZATION; MILITARY AERONAUTICS; SIGNALING AND TELEGRAPHING, MILITARY.

**SIGNALING AND TELEGRAPHING, MILITARY.** The term "military signaling" usually refers to the art of transmitting intelligence by visual signals. The employment of sound, electricity, and aeronautics for the transmission of signals, in their application by the army, is also included.

From the beginning of human existence signals (signs, sounds, gestures, and other indications) were used by individuals of tribes or communities for communication. Sounds came first, followed by representations of natural objects, hieroglyphics of the ancients, and other picture writings of savage peoples. The illustration shows a picture dispatch sent by North American Indians to the French during the war with England in Canada. It means that "they [the warriors]

FIG. 1. PICTURE WRITING OF INDIANS.

departed from Montreal," represented by a bird just taking wing from the top of a mountain. The moon and the buck show the time to have been on the first quarter of the buck moon (July).

While oral language was being developed, a means of communication beyond the limits of the voice was undertaken by pantomime signs; with the hands and body for short distances, by signal fires, smoke, prearranged display of shields, spears, flags, clothing, etc., for longer distances.

The first record of a signal corps is given in the writings of Polybius about 260 B.C. The invention of the system then used is ascribed to Cleoxenes or Democritus, but the development of their ideas into a system was due to Polybius. He describes his system as follows:

"Take the alphabet; divide it into five parts with five letters in each. In the last part . . . a letter will be wanting, but this is of no importance. Then let those who are to give and receive the signals write upon five tablets the

FIG. 2. SIGNAL SYSTEM OF POLYBIUS.

five portions of the letters in their proper order and concert together the following plan: that he, on one side, who is to make the signal, shall first raise two lighted torches and hold them erect until they are answered by torches from the other side. This . . . shows . . . both sides ready and prepared. That afterward he again who gives the signal shall raise first some torches upon the left hand, in order to make known to those upon the other side which of the tablets is to be inspected—if the first, e.g., a single torch; if the second, two; and so of the rest. That then he shall raise other torches also upon the right, to mark . . . to those who receive the signal which of the letters upon the tablet is to be observed and written. When they have thus regulated their plan and taken their respective posts it will be necessary, first, to have a diopical instrument formed with two holes or tubes—one for discovering the right, and the other the left hand of the person who is to raise the torches on the opposite side. The tablets must be placed erect and in their proper order . . . and . . . there should be also a solid fence of about 10 feet in length and of the height of a man, that the torches, being raised along the top of those ramparts, may give a more certain light, and when . . . dropped again that they may also be concealed behind them."

Signals are called transient when each element disappears on completion, permanent when the signal is a combination of arbitrary elementary indications—sounds, colors, forms, in accordance with rules familiar to sender and receiver. Primary signals are the elementary signs: those formed by uniting primary elements are called combination signals. These signals may consist of a single primary signal repeated, as 111, the number of repetitions conveying meaning; or by uniting primary signals, as 123, 113, etc. Three elements form signals of the third class, e.g., 131, 333; 12 or 21 are called second-class signals; a code is any number of prearranged signals, each having definite meaning to receiver and sender. If each letter is homographic, the class term is indicated by a certain (and always the same) number of symbols; chronosemic or time signals depend for meaning on time intervals between signals. The Myer system, long used in the United States army and navy, illustrates this class of signals, familiar examples being: a = 22, b = 2112, e = 12, i = 1, n = 11, o = 21, t = 2; can = c, not = n, yes = y, word

= w; I understand = 22 22 3, wait a moment = 1111 3; and many others similarly formed.

The Myer Code, in the army, was discontinued September 4, 1912, and replaced by the International Morse Code for all visual signaling, radio-telegraphy, and on cables using siphon recorders. The American Morse Code is still used on army telegraph lines, short cables, and on field telegraph lines. The International Morse Code, known as the General Service Code, is employed in all communications between the army and navy, whether by radio, visual, or sound signals. These two alphabets are given under TELEGRAPH.

### VISUAL SIGNALING

Modern military signaling of this nature is done according to United States army regulations by flag, torch, hand lantern, or beam of searchlight (without shutter). This involves the use of one position and three motions. The position (Fig. 3) is with the flag or other appliance held vertical, the signalman facing towards the distant station. The first motion, corresponding to the dot of the telegraph code,

FIG. 3. INITIAL POSITION.

FIG. 4. THE DASH.

is to the right of the sender and embraces an arc of 90 degrees, starting from the vertical and returning to it, in a plane at right angles to the line connecting the two stations. The second motion, giving the dash, is a similar motion to the left (Fig. 4) of the sender; while the third motion (front) is downward directly

FIG. 5. FLAGS OF UNITED STATES ARMY SIGNAL CORPS.

in front of the sender, returning instantly upward to the first position. This motion indicates a pause or conclusion after a word or sentence. Though ordinarily used with the shutter, like the heliograph, the beam of the searchlight may be used for long-distance signaling when no shutter is available, in a manner similar to the flag or torch, the first position being

a vertical one. A movement of the beam 90 degrees to the right of the sender corresponds to a dot; a similar movement to the left gives a dash; the beam is lowered vertically for front. With the torch or hand lantern a footlight is employed as a point of reference. The lantern is swung out upward to the right of the footlight for a dot, to the left for a dash, and raised vertically for front. In all kinds of signaling each word, abbreviation, or conventional signal is followed by front.

For long-distance signaling there are employed at night the heliograph, flash lantern, and a searchlight provided with shutter. The first position according to the United States army code is secured by turning a steady flash on the receiving station. Short and long flashes are

FIG. 6. TWO-ARM STATIONARY SEMAPHORE.

used for signals, a short flash corresponding to a dot and a long steady flash to a dash. It is usual to make the elements of a letter slightly longer than in sound signals. In the United States navy, with flash or occult signals, the third movement, front, is used. It is made by displaying a long flash. This is not used in the United States army. In the daytime and in ordinary weather the shutter searchlight can be readily used for distances up to 10 miles at sea and is considered of exceptional value by the navy, being independent of background and capable of being used behind armor or other shelter.

The Ardois system of the United States army and navy consists of four lights, usually electric, suspended vertically from a staff, mast, or yard and operated from a keyboard. The red lamp indicates a dot and the white lamp a dash, the appropriate order giving the letter of the alphabet or other signal. For instance, red-white, or dot-dash, represents the letter A, and white-

red-red-red, or dash-dot-dot-dot, represents the letter B. Coston lights, used also for marine or distress signals, are made of a slow-burning composition and are usually held in a socket and displayed by hand. Rockets, bombs, and the Very pistol (see SIGNALS, MARINE), not being adapted for general use with the dot and dash code, are used in connection with a conventional or a preconcerted code and for emergency signals.

The two-arm semaphore method is another way of transmitting signals, and a machine or stationary semaphore is authorized for the United States army and may be employed in the manner indicated in the diagram. In the machine a third arm or indicator is displayed on the right of the sender (at night a red

with a 9-inch centre. The hand flags are used in the same manner as the semaphore machine, except that in making the interval the flags are crossed downward in front of the body.

The International Code of Signals is used by the military forces when such use may appear desirable, as on army transports, at seacoast fortifications, and between the army and the navy. See SIGNALS, MARINE, and Colored Plate showing the signal flags.

Sound Signals can be made by the whistle, foghorn, bugle, trumpet, and drum for use in a fog, mist, falling snow, or at night, according to the dot and dash code. In applying the International Morse Code to sound signals one short blast indicates a dot and one long blast

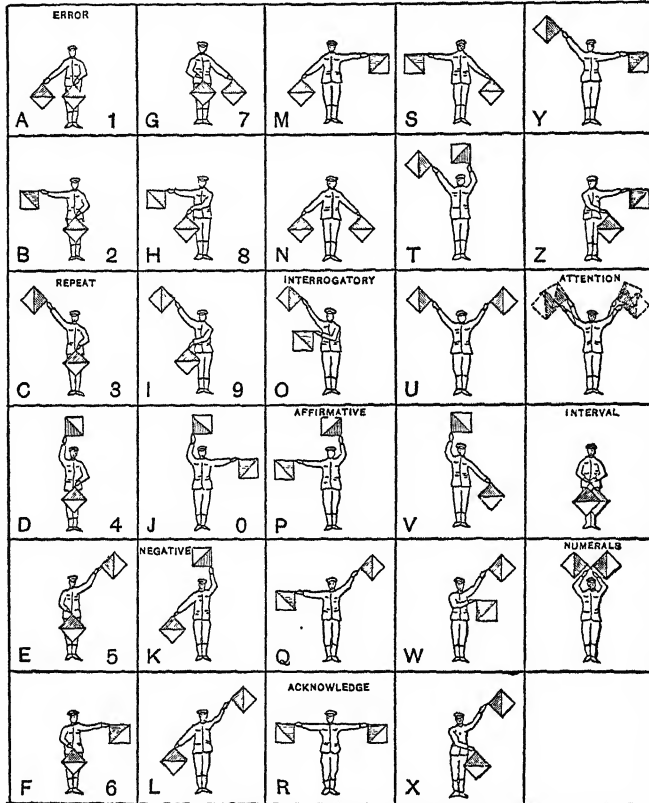

FIG. 7. TWO-ARM SEMAPHORE CODE WITH HAND FLAGS.

light screened to the rear indicates the direction of the sending). The machine is so placed that it may be seen through the greatest arc of the horizon, and electric lights are installed on the vanes. The two-arm semaphore affords the most rapid method of transmitting held-out messages.

Hand flags are used both by the army and the navy. They are useful when rapid communication for short distances is needed, especially for interior signaling within batteries of the field artillery. The hand flags of the United States navy are of blue with a white square, or red and yellow diagonally, the colors to be used depending upon the background. The flags are from 12 to 15 inches square and are usually attached to light wooden staffs about 2 feet in length. In the United States army the hand flags are orange with a scarlet centre or scarlet with an orange centre; size, 18 inches square

a dash, except with the drum, where one tap indicates a dot and two taps in rapid succession a dash. Although such signals can be used with a dot and dash code, they should be so employed in connection with a preconcerted or conventional code.

Ciphers. To secure secrecy it is necessary often to employ various means whereby messages or any writings can be transcribed in occult terms. Whatever their nature, all ciphers must employ some distinct method for transcription. This method, termed a key, is usually applied directly in enciphering and reversed in deciphering messages. A cipher disk (Fig. 8) often employed consists of two circles of cardboard, leather, or other material concentrically placed, with the upper disk revolving upon the lower. The alphabet, reading from left to right, is printed around the circumference of the lower disk. On the upper disk is the alphabet, read-

ing from right to left. To put a message into cipher the key letter or the first letter of the key word or words is placed opposite "A." The cipher letters to be written are those opposite the text letter when the letter "a" on the upper

FIG. 8. CIPHER DISK.

disk is set opposite the selected key letter on the lower disk. For example, with J as a key letter, "Send powder" would be written "rfwg uvngfs."

**Infantry Company Signal Flags.** The United States army infantry drill regulations prescribe signal flags to be carried by the company musicians in the field. In addition to their use in visual signaling, these flags also serve to mark the assembly point of the company when disorganized by combat, and to mark the location of the company in bivouac and elsewhere when such use is desirable. The number of the regiment is at the centre of the flag, while for militia and volunteers the State name abbreviated and the letters of the company appear. The regulations prescribe the following arrangement:

- First battalion:**  
 Company A. Red field, white square.  
 Company B. Red field, blue square.  
 Company C. Red field, white diagonals.  
 Company D. Red field, blue diagonals.
- Second battalion:**  
 Company E. White field, red square.  
 Company F. White field, blue square.  
 Company G. White field, red diagonals.  
 Company H. White field, blue diagonals.
- Third battalion:**  
 Company I. Blue field, red square.  
 Company K. Blue field, white square.  
 Company L. Blue field, red diagonals.  
 Company M. Blue field, white diagonals.

A simple code of signals is provided, as given below, for communication between the firing line and the reserve or commander in rear. It is essential that in transmission the concealment of the flags from the enemy's view should be observed. In the absence of signal flags such a substitute as the headdress may be employed.

**Heliograph.** The heliograph (q.v.) for trans-

mitting signals between distant stations by means of the sun's rays, was successfully used by the British army in India about 1878, and the Mance instrument was experimentally employed in the United States army as early as 1878. The early English heliograph had its

ALPHABET LETTER	If signaled from the rear to the firing line	If signaled from the firing line to the rear
aaa	Ammunition going forward	Ammunition required
ccc	Charge (mandatory at all times)	Am about to charge if no instructions to contrary
sss	Support going forward	Support needed
fff	Move forward	Preparing to move forward
hhh	Halt	Negative
nnn	Negative	Affirmative
yyy	Affirmative	

movable mirror controlled by a key instead of a shutter, as in the case of modern instruments, and the difficulty of maintaining accurate adjustment during the transmission of signals constantly threw the flash out of alignment. On the American signal service heliograph a screen is provided which operates as a shutter and controls the flash reflected from an immobile mirror.

The heliograph possesses great portability, the ability to work over a great range, comparative rapidity of operation, and the great merit that the signals are invisible except to observers located approximately on a right line adjoining the two stations, but naturally it cannot be operated unless there is sunlight. Ordinarily the normal working range of the heliograph is about 30 miles, and its dependable speed of transmission is from 5 to 12 words per minute.

HELIOGRAPH ASSEMBLED.

**Acetylene.** The facility with which acetylene (q.v.) gas can be generated makes an acetylene signal lantern a useful instrument for the purpose of transmitting signals by means of intermittent flashes. It is the standard night visual equipment of the United States Army

Signal Corps and involves a specially constructed lantern where the height of flame is controlled by a key so as to show a small flame or a bright flash. This device possesses the great advantages of portability, speed of operation, and comparatively great range, but it is naturally affected by disturbances in the atmosphere caused by rain, fog, and moonlight. Nevertheless, as night conditions are usually more uniform than in the daytime, the acetylene lantern is thought to be the most reliable of the various visual signals adopted by the United States army.

Outside the visual signal above described there are a number of other visual and sound pre-

ACETYLENE SIGNAL LANTERN.

concerted signals. They may be grouped as follows: bugle signals, of the nature of commands, e.g., "attention," "forward," etc. Whistle signals: "attention," a short blast; "suspend firing," a long blast. Arm signals, in which the movement of the arm indicates the thing to be done, e.g., "squads right" or left, "as skirmishers," "change elevation," "rush," etc. (Consult *Infantry Drill Regulations*, 1911.) Rifle and arm signals for patrols and scouts: "enemy in sight in small numbers," hold the rifle above the head horizontally; "enemy in force," as above, raising and lowering rifle several times; "take cover," a downward motion of the hand. To indicate "danger, enemy in sight," both arms raised vertically; "danger is imminent," both arms raised and lowered energetically.

**Military Telegraph, Telephone, Radiotelegraphy, Aéroplane.** The electric telegraph for the transmission of signals came into practical and commercial use about 1835, as discussed under TELEGRAPH. Naturally its military applications followed.

**Lines of Information.** A general term adopted to apply to the means by which military messages are transmitted between two or more stations. As to construction, they are classified as permanent, semipermanent, and field lines. Permanent lines are similar to standard commercial lines. Semipermanent consist of light bare wires, usually No. 14 galvanized, supported on light poles, called lances. From 7 to 15 miles of such lines can be established daily. Either telegraph or telephone is

used. Field lines are those laid on the ground hastily for temporary use and usually consist of insulated wire paid out from reels on carts or wagons or, in the smaller size wire, from hand reels. Sometimes bare wire is used on the ground, in which case only the buzzer will operate satisfactorily over them.

Classified according to use, lines of information are either strategical or tactical. The former are permanent or semipermanent; the latter are generally field lines, rapidly laid and taken up to follow the movements of the troops, and are sometimes called combat lines in that they transmit information and orders to the fighting units. Special vehicles and pack mules are required for transporting and laying wire and carrying the necessary instruments, including wireless sets, lances, etc. These include wire carts, instrument wagons, lance trucks, balloon train wagons, pack mules for radio sets, wagons for aéroplanes, etc. On field lines the buzzer in one of its forms is almost universally used. This instrument was introduced into the United States army in 1890 and first showed its efficiency in the Philippine and China campaigns. In its present form of field buzzer, and still more portable cavalry buzzer, it combines in a small leather case weighing a few pounds a complete telegraph and telephone station, including the necessary batteries. Its capacity for working over circuits impossible for any other telegraph instrument, such as bare-wire lines laid on the ground, through wire of wire fences, or railroad rails, or even through considerable breaks in the line when the ends lie on the ground, makes it the ideal instrument for field lines. To open a station when unreeling wire from horseback it is only necessary to fasten the ground of the buzzer to the horse by a small metal plate under the saddle blanket. By working the key an interrupter is operated giving a high singing note, which is broken up into the dots and dashes of the Morse alphabet. These correspond to vibratory electrical impulses, which go out on the line and are heard in the telephone receiver at the distant station. The efficiency of the buzzer under the difficult conditions stated is due to the marvelous sensitiveness of the telephone receiver to these rapidly pulsating currents. In practically the same circuit as the interrupter is a telephone transmitter, and when the button switch on this is depressed, the instrument becomes at once converted into a very efficient telephone set. The field telephone and field induction telegraph are specially designed for use under the severe conditions of field service. Portability and electrical efficiency are prime requisites.

The radio (wireless) apparatus of the United States Signal Corps included, in 1916, 10 stations in Alaska from 1 to 10 kilowatts, stations of 10 kilowatts in the Philippines, 1 to 2 kilowatts in the coast defenses, 1 to 5 kilowatts on army transports, and larger sets at important military stations in the interior of the United States. Two types of portable field sets are in use. The smaller set, carried on three pack mules, has a range of about 25 miles. The larger size, carried on a wagon, has a range, depending on weather conditions and terrain, which varies from 75 to 800 miles. Successful experiments at long distances, in America in 1915, with the wireless telephone suggests the future military use of this means of communication and as the best yet devised. The difficulties to be met in

maintaining wire lines on the battlefield were fully appreciated in the Great War.

**Aéronautics.** In the United States army the Signal Corps (q.v.) is charged with the collection and transmission of military information. Under this general provision aéronautics in all its forms, including aéroplanes and gas bags, whether free, captive, or dirigible, pertains to that corps and has been developed by it since the first public flight of the Wrights in 1909 at Fort Myer, Virginia. Various systems of signals, from the aeroplane to earth, have been tried—flags, smoke signals, radiotelegraphy. The aeroplane was used in the Great War to assist in the adjustment of field-artillery fire by having the shorts and overs observed by the aviator signaled to the officer firing the battery. Consult: A. J. Myer, *A Manual of Signals* (Washington, 1879); United States Signal Corps, *Manual No. 3* (ib., 1910); *Signal Book, United States Army* (ib., 1913); United States Signal Corps, *Radiotelegraphy* (ib., 1914). See ARMY ORGANIZATION; MILITARY AÉRONAUTICS; SIGNALS, MARINE.

**SIGNALS, Fog.** See FOG SIGNALS.

**SIGNALS, INTERNATIONAL.** See SIGNALS, MARINE, and accompanying Colored Plate.

**SIGNALS, MARINE.** Marine signals now in current use may be divided into three classes: (a) day signals, (b) night signals, and (c) day and night signals. Day signals consist of set combinations of flags or shapes, moving combinations of arms or shapes, or the waving of shapes or flags. The use of flags of various shapes is widespread and of ancient origin; the Venetians used them, and there is good reason to believe that simple signals of this sort were used in early times. In 1856 the British government devised a system of signaling by flags which has been adopted by all maritime nations. It formerly consisted of 13 square flags, five triangular pennants, and a swallow-tailed flag. One of the pennants was the code pennant; the other pennants and flags were assigned to the consonants of the alphabet from b to w. On January, 1901, by international agreement, a new code went into effect. It consists of 19 square flags, two swallow-tailed flags, and five pennants besides the code or answering pennant. These are assigned (except the code pennant) to the different letters of the alphabet. The flags and pennants of the old code are retained with few changes, the new ones being added to cover the vowels and x and z. The flags and pennants are hoisted singly or in combinations of one, two, three, or four. One-flag signals are important in character and much used; two-flag signals are urgent and important; three-flag signals include all ordinary messages; four-flag signals signify geographical positions (seaports, islands, bays, etc.), alphabetical spelling tables, and vessels' distinguishing numbers. The signification of each combination of flags is the same in all languages, each combination standing for a complete message, a sentence, a phrase, or a single word. A vessel using a signal book printed in English can communicate with a vessel using a book printed in Italian as easily as with one using an English book.

The spelling table may be used between vessels having books printed in languages using Roman characters. The American edition of the international signal code is published by the Hydrographic Office of the Navy Department and is divided into three parts. The first contains

urgent and important signals, signals for tables of money, weights, etc., for geographic positions (arranged geographically), and a table of phrases formed with auxiliary verbs. The second part (more than half the book) is an index. It consists of a general vocabulary and a geographical index, each alphabetical. The third part gives lists of the United States storm-warning, life-saving, and time-signal stations, and of Lloyd's signal stations throughout the world, and contains semaphore and distant signal codes and the United States army and navy wigwag codes. As the international code flags have to be carried by every man-of-war, to avoid multiplicity of flags, the naval signal books of nearly all nations have been adapted to their use.

The use of shapes is common for distant signals, as colors and patterns of flags cannot be determined with certainty beyond 2 or 3 miles. These shapes are cones, balls, and drums, supplemented with a square flag and a pennant. The placing of movable arms in certain positions is termed semaphore signaling. Devices for semaphore signaling have been in use for some centuries at least, they were called telegraphs and were placed in sight of each other to form long chains of communication across country. The modern semaphore has two or three arms, and its use is chiefly at signal stations on the coast or on board ship. In most navies a simple semaphore code is arranged for two small flags, one to be held in each hand of the signalmen. In the United States and British navies there are seven positions, in the French navy eight. These positions of the first named are: right arm inclined downward at angle of 45°; same, horizontal; same, inclined upward at angle of 45°; three of the remaining positions are for the left hand at 45° downward, 45° upward, and horizontal; the remaining position is either arm held vertically. In the French code the right arm held vertically is one position, and the left arm held vertically is another. In both codes the combination of any two positions is used in addition to the simple positions. In the United States army and navy the signal-flag wigwag code is used as described under SIGNALING AND TELEGRAPHING, MILITARY.

**Night Signals** are made with lights, rockets, torches, etc. By waving a lamp or torch or changing the direction of the beam of a searchlight from side to side the wigwag code may be used. In Very's night signals, visible at a distance of 10 miles or more under favorable circumstances, red and green stars like those in Roman candles are fired from pistols in different combinations, four in each and each combination or group of four corresponding to a figure. Coston's signals, consisting of different-colored flaming lights, were formerly used. Rockets and blue lights (q.v.) are used to attract attention and for special purposes. The night signals most in use in the navies of the world are the Ardois, the invention of a French officer of that name, brought into general use in 1855-90. They consist of double electric lamps—one-half white and one-half red—arranged on a cable extending up and down one of the masts. In many foreign navies these lamps consist of five pairs, but in the United States navy there are but four, and the significations of the telegraph code are used. The lights are read downward from the mast-head, the red and white lights corresponding to dot and dash of the telegraphic or to 1 and 2 of the wigwag code. The space or interval has a

special combination to denote it. These lights are worked by a keyboard, and the signaling is quite rapid. In the United States and other navies one or two white lights are flashed, using the continental telegraphic code with short and long (or double) flashes to indicate dots and dashes.

The day and night signals are sound signals and wireless telegraph signals. The former are composed of long and short blasts of a whistle or double and single strokes of a bell. With wireless telegraph systems the continental telegraphic code is employed.

Some simple signals are used in Rules of the Road at Sea. (See RULES OF THE ROAD.) Signals of distress are of various kinds, such as hoisting the colors, i.e., the national flag, upside down, firing guns, rockets, blue lights, wireless calls, etc. Consult *Instructions for Signaling, United States Navy* (Washington, 1898), and United States Hydrographic Office, *International Code of Signals* (Amer. ed., ib., 1914). See SIGNALING AND TELEGRAPHING, MILITARY.

**SIGNALS, RAILWAY.** See BLOCK SIGNAL SYSTEM; RAILWAYS.

**SIGNATURE** (ML. *signatura*, from Lat. *signare*, to sign, from *signum*, sign, mark, token). In its broadest legal sense, the name of a person, written or printed, or a sign or mark to represent a name, either executed or affixed by the person himself or adopted by him as his own. It became common to sign legal instruments after the Statute of Frauds, 29 Car. II, c. 3. Previous to that time a person intending to bind himself by a written instrument usually affixed his seal. In most jurisdictions a printed name may be adopted by a person as his signature. Where a person wishing to execute a written instrument is unable to write, it is customary to have some one write his name and to have him make a cross mark between Christian name and surname. One writing the name usually puts above the mark the word "his" and, below, "mark" and becomes a witness to identify it. If the illiterate person be awkward, the one writing the name may also make the mark, while the former touches the pen, but there have been decisions that this is not necessary. In some jurisdictions a person's name written by another may be adopted by the former as his signature without affixing a mark. A signature is usually at the end of an instrument, but (in the absence of statute) it may be elsewhere if clearly intended as such. The mere recital of a person's name in the body of an instrument will not constitute a signature. In contracts some sign or act is necessary which will indicate an intention on the part of the contracting parties to be bound by the terms of the instrument. Where the Statute of Frauds requires a contract or conveyance to be in writing and signed by the person to be charged or by his agent, a physical mark is necessary; and where a statute requires an instrument to be subscribed, as a will, the signature must be at the end, or the instrument will be a nullity. See SEAL.

**SIGNATURE, IN MUSIC.** See KEY; MUSICAL NOTATION, *Time Signatures*; TIME.

**SIGNET, WRITERS TO THE.** See WRITERS TO THE SIGNET.

**SIGNET RING.** See JEWELRY.

**SIGN LANGUAGE.** A system of intertribal gesture communication among American Indians used by the Plains tribes in default of a common language, practically the same from Canada to

the Mexican border. In many respects it forms the manual counterpart of the Indian pictograph system as displayed in buckskin paintings or birch-bark records. The signs are based upon natural ideas or the things of everyday Indian life, so as to be readily interpreted by a member of any of the tribes. Thus, *cold* is indicated by a shivering motion of the hands in front of the body. By an extension of the idea the same sign indicates the cold season, i.e., *winter*, and as the Indians count by winters it may mean also *a year*. A slow turning of the hand upon the wrist indicates vacillation, doubt, *maybe*. A modification of this, with quicker movement, is the question sign. *Fatigue* is indicated by a downward sweep of the hands, with index extended, giving the idea of collapse. *Strong, strength*, are indicated by the motion of breaking a stout stick; *bad*, by a motion of contemptuously throwing away; *foolish*, by a circling movement of the fingers in front of the forehead, i.e., *rattle-brained*; *song, singing*, by the same motion next the side of the head, to indicate the shaking of the rattle which usually accompanies the song. As the song and rattle are almost invariable accompaniments of religious ceremonies and medical conjurations, the same sign may also mean *sacred, religion, doctor, medicine*, according to the context. *White man* is indicated by drawing the fingers across the forehead, typifying the wearing of a hat, and there is a special sign for *Indian* and for each tribe as well as for particular rivers, mountains, etc. Two fingers extended at the side of the head indicate a *wolf*, as representing the erect ears; the same two extended fingers drawn across in front of the body indicate the *dog*, as the former carrier of the Indian travois; the same fingers brought down crossed over the extended index finger of the other hand indicate the *horse*, as the riding animal.

The signs follow the regular order of the words in the Indian sentence. The general system is so elaborated that there is a sign or combination for every idea in the Indian category and universally understood. There is also a system of long-distance signaling by means of smoke, riding in a circle, waving a blanket, etc., in certain ways, for particular occasions.

A similarly elaborate system of manual signs occurs in parts of Australia. Consult: Mallery, *Collection of Gesture-Signs and Signals of the North American Indians, with Some Comparisons* (Washington, 1880); Clark, *Indian Sign Language* (Philadelphia, 1884); W. E. Roth, *Ethnological Studies among the North-West-Central Queensland Aborigines* (London, 1897). See GESTURE LANGUAGE.

**SIGNORELLI**, sē'nyō-rĕl'ĕ, LUCA (1441-1523). An Italian painter of the Renaissance, usually classed with the Umbrian school, but his training and affinities are rather Florentine. He was born at Cortona, studying first under Piero della Francesca at Arezzo, and at an early period he came under the influence of Pollaiuolo at Florence. His life was chiefly spent in peregrinations among the hill towns of Tuscany and Umbria, where most of his work was done. His first recorded activity (1470) is in his native town, but at an early period he worked independently at Florence, executing while there the "Pan" (c.1475), now in the Berlin Museum, for Lorenzo de' Medici—a fine example of his treatment of the nude—and a Madonna, now in the Uffizi. Among other works in Florence are the fine portrait of a man, in the Torregiani Palace,

and the "Crucifixion with the Magdalen." Other well-known altarpieces are a grand "Madonna with Saints," in the cathedral of Perugia (1484), and the Bicci altarpiece in San Agostino and Siena (1498). Many of the small towns of Perugia and Tuscany possess fine examples of his work.

But Luca's principal works are his frescoes, which far transcend his panel paintings. He was one of the painters selected to decorate the Sistine Chapel with subjects from the "Life of Moses" (1482). In 1484 he received a commission for the decoration of the sacristy of the church of Loreto with subjects from the New Testament, including the masterly "Conversion of St. Paul." At Siena he also painted in fresco a series of antique subjects in the Petrucci Palace and in the neighboring convent of Monte Oliveto (1497) eight large subjects from the "Life of St. Benedict," treated in an interesting decorative manner. His success in these commissions led to what is considered his masterpiece, the frescoes in Orvieto Cathedral (1499-1503). The subject represented is the "End of the World"; in eight panels of the ceiling are Christ and the heavenly hierarchy, while eight frescoes of the wall culminate in the "Last Judgment." They are remarkable examples of restless and intricate movement.

Under the pontificate of Julius II and again in 1513 he visited Rome, but was unable to make headway against the rising genius of Michelangelo and Raphael. He retired to Cortona, where he was held in the highest honor, and continued at his craft, his work in no wise deteriorating, until his death, June 14, 1523. His last works are principally in Cortona and the vicinity, like the fine "Pietà" (1502) and the "Last Supper" (1512), in the cathedral; an excellent example is the fine "Madonna" with the Trinity, two archangels, and saints, in the Uffizi, Florence.

Signorelli's great importance in Italian art is that he was the first to use the nude as the chief means of pictorial expression. Like the Greeks, he expresses emotion by means of muscular movement and construction, the faces being only typical of general emotion. He also introduced the use of the human body as a purely decorative motive, foreshadowing Michelangelo, whom he undoubtedly influenced. In his work the drawing, composition, and action are all excellent, combining impressive breadth of execution with great strength of conception; but the effect is sometimes marred by an inharmonious use of color. Consult: Vischer, *Luca Signorelli und die italienische Renaissance* (Leipzig, 1879); id., in Dohme, *Kunst und Künstler* (Eng. trans., London, 1880); Giorgio Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects*, vol. ii (Eng. trans. by Blashfield and Hopkins, New York, 1896); Maude Crutwell, *Luca Signorelli* (London, 1899); *Masters in Art*, vol. viii (Boston, 1907).

**SIGOURNEY**, sig'ēr-nī, LYDIA [HUNTLEY] (1791-1865). An American poet and philanthropist, born in Norwich, Conn. She was one of the first women in America to plan for higher female education. In 1809 she established at Norwich a girls' school and in 1814 one at Hartford. This latter she directed until her marriage, in 1819, to Charles Sigourney, a Hartford merchant. The first of her 50-odd books was *Moral Pieces in Prose and Verse* (1815). Her autobiographical *Letters of Life* appeared posthumously (1866). Mrs. Sigourney edited numerous ju-

venile and religious publications and contributed widely to periodicals.

**SIGRA**, sē'grā. A suburb of Benares (q.v.).  
**SIGS'BEE**, CHARLES DWIGHT (1845-1923). An American naval officer, born at Albany, N. Y. He graduated at the Naval Academy in 1863, was assigned to the Gulf squadron, and took part in the battle of Mobile Bay. In 1865 he was transferred to the North Atlantic squadron and participated in the bombardment and capture of Fort Fisher. From 1874 to 1878 he was employed in exploring the bottom of the Gulf of Mexico, and because of improvements introduced in this work he received the Order of the Red Eagle of Prussia and a gold medal. He was promoted to commander in 1882 and to captain in 1897. In the latter year he was assigned to the battleship *Maine*, which, while still under his command, was destroyed in the harbor of Havana, Cuba, on Feb. 15, 1898. On this occasion he displayed great courage and coolness and was commended for his self-restraint in asking a suspension of judgment until an investigation should show where the responsibility lay. During the war he commanded the auxiliary cruiser *St. Paul*. From 1898 to 1900 he commanded the *Texas* and was then appointed chief officer of naval intelligence, a member of the Naval Construction Board and of the Naval General Board. In 1903 he was made a rear admiral and in 1907 was retired. He wrote *Deep Sea Sounding and Dredging, United States Coast Survey* (1880), and *The Maine: An Account of her Destruction in Havana Harbor* (1899).

**SIGURD**, sē'gurd. An opera by Reyer (q.v.), first produced in Brussels, Jan. 6, 1884; in the United States, Dec. 24, 1891 (New Orleans).

**SIGURD**. The hero of the Norse Eddas, corresponding to the German Siegfried of the *Nibelungenlied* (q.v.).

**SIGURDSSON**, sē'gurd-sōn, JÓN (1811-79). An Icelandic scholar and statesman, born at Rafnseyri, northwest Iceland. For several years he was archivist, and in 1851 was made president, of the Icelandic Archaeological Society. In 1845, when the Danish government granted the reestablishment of the Althing, the Icelandic national assembly, he was made its Speaker, and it was mainly due to his exertions that Iceland obtained practical home rule in 1874. His publications include *Diplomatarium Islandicum, 874-1264*, and *Lovsamling, 1096-1859*, a collection of laws (17 vols., 1853-77). Consult K. Maurer, *Jón Sigurdsson, the Icelandic Patriot* (Reykjavik, 1887).

**SIGWART**, zēk'vārt, CHRISTOPH VON (1830-1904). A German philosophical writer, born at Tübingen. Educated in theology and philosophy, he was professor in the seminary at Blaubeuren from 1859 to 1863 and in 1865 was made professor of philosophy at Tübingen. His publications include: *Ulrich Zwingli: der Charakter seiner Theologie, mit besonderer Rücksicht auf Picus von Mirandola dargestellt* (1855); *Spinozas neuentdeckter Traktat von Gott, dem Menschen und dessen Glückseligkeit* (1866); the particularly well-known *Logik* (1873-78; 3d ed., 1904; Eng. trans., 1894); *Vorfragen der Ethik* (1886); *Die Impersonalien* (1888).

**SIKA**, sē'ká. The small deer (*Cervus sika*) of Japan and north China, having a spotted coat in summer which becomes uniformly brown in winter. The antlers usually have only four points, as the bez-tine is lacking. These deer are natives of forested hills, and many specimens

have been naturalized in European parks. The Manchurian deer is probably only a larger variety, but two or three other valid species belong to the sika group, of which the best known is that common in the mountains of Formosa (*Cervus taévanus*). Consult Richard Lydekker, *Deer of All Lands* (London, 1898).

SIKA ANTLERS.

**SIKES, BILL.** A brutal, hardened burglar in Dickens's *Oliver Twist*.

**SIKESTON**, siks'-tūn. A city in Scott Co., Mo., 166 miles south by east of St. Louis, on the St. Louis and San Fran-

cisco and the St. Louis, Iron Mountain, and Southern railroads (Map: Missouri, G 5). There are large flouring mills which ship their product abroad, hoop and heading factories, and a box factory. Pop., 1900, 1077; 1910, 3327.

**SIK'HIM.** A native state of India. See **SIKKIM**.

**SIKHISM.** See **SIKHS**.

**SIKHS**, siks (Hindi, disciple, probably associated with *sikhna*, to learn, Skt. *śisya*, disciple). The term applied to a religious community of which the Punjab, in northwestern India, is the principal seat.

From the time of the tenth pontificate the sect called itself the Khalsa, "the pure." At first the Sikhs were merely a religious sect affected by Mohammedan influences. Their religion was a deism tinged with superstition. From the energy which they developed under oppression, and their proselytizing enthusiasm, the Sikhs became by degrees a formidable nationality. Their founder, Nanak, was born in 1469 near Lahore and died in 1539. To him succeeded, in turn, nine pontiffs, each of whom, like himself, is popularly denominated guru, or teacher. These were Angad (1539-52), Amardas (1552-74), Ramdas (1574-81), Arjun (1581-1606), Hargovind (1606-45), Harray (1645-61), Harkrishna (1661-64), Teg Bahadar (1664-75), and finally Govind (1675-1708).

The aim of Nanak was religious and humanitarian and designed to combine Hindus and Mohammedans into one brotherhood. His three immediate successors held themselves aloof from political complications. Arjun, however, not content with signaling himself as the compiler of the *Adi Granth* (q.v.) and as the founder of Amritsar (q.v.), the holy city of the Sikhs, rendered himself conspicuous as a partisan of the rebellious Prince Khusrū, son of Jahangir. Hargovind, who succeeded Arjun, called the Sikhs to arms, led them to battle, and became an active, though sometimes refractory, adherent of the Great Mogul, against whom his predecessor had plotted. Harray subsequently espoused the part of Dara Shikoh, son of Shah Jehan (q.v.), when contending with his brothers for the throne of India. Harkrishna, son of Harray, died a child and was only nominally a guru. Teg Bahadar was executed by Aurungzebe (q.v.) in 1675 for having refused to embrace Moham-

medanism. The chief motive that instigated his son Govind, the tenth of the teachers, was, probably, a desire to avenge the death of his father. He resolved to combat both the Mohammedan power and the Mohammedan religion and for that reason instituted the worship of steel and book (sword and bible). In what measure he was a man of thought is evinced by his legacy to his coreligionists, the second volume of the Sikh scriptures, which teaches that a Sikh should worship one God, observe morality, and practice the use of arms. Govind's successor Banda, after three cruel massacres of his Mogul opponents, was himself slain in 1716. After his death the government of the Khalsa passed into the hand of the Akalis, military zealots who in 1764 began to rule the Punjab. In the early part of the nineteenth century Ranjit Singh (q.v.) built up a powerful Sikh monarchy, which became a formidable neighbor to the British. After his death (1839) the British engaged in the First Sikh War (1845-46), in which their forces were led to victory by Sir Hugh Gough (q.v.) and which secured to the East India Company the possession of a great portion of the Sikh territory. The Second Sikh War (1848-49), in which Sir Hugh Gough again figured, terminated in the submission of the Sikhs and was followed by the annexation of the Punjab to British India. The Khalsa ceased to exist. The Sikhs are now divided into two classes, Sahijdari, or those who live at ease, and Kesadhari, or those who wear long hair.

According to the census of 1911 there were then 3,014,466 Sikhs in India. Consult: E. W. Hopkins, *Religions of India* (Boston, 1895); M. A. Macauliffe, *The Sikh Religion: Its Gurus, Sacred Writings and Authors* (6 vols, Oxford, 1909); Dorothy Field, *Religion of the Sikhs* (London, 1914). For an account of the Sikh wars, consult: Gough and Innes, *The Sikhs and the Sikh Wars* (ib., 1897); Rait, *Life and Campaigns of Viscount Gough* (ib., 1903); J. D. Cunningham, *History of the Sikhs* (ib., 1903).

**SI-KIANG**, sē'kyāng', or WEST RIVER. The most important river of southwest China. It rises in the Province of Yunnan near Nanning Hien (or Kuchingfu), flows through a generally mountainous country in a tortuous course through Yunnan, Kwangsi, and Kwangtung for 1650 miles to the South Sea (Map: China, J, K 7). It receives many tributaries, chiefly from the right, the most important being the Yü-kiang or Melancholy River. Near Samshui (q.v.) the stream divides, the smaller portion flowing east and, after receiving the waters of the Pe-kiang or North River, being known as the Chu-kiang or Pearl River, on which the city of Canton is situated. The main body of the waters of the Si-kiang continues its course west of the Chu-kiang delta, breaking up into several channels. The estuary is 75 miles wide. The upper courses are obstructed by many rapids. From Samshui to Wuchow it is navigable for vessels drawing not more than 8 feet, while lower down the largest vessels may float.

**SIKKIM**, or **SIKHIM**, sikh'im. A native state in the northeast of India, feudatory to Bengal (Map: India, F 3). Area, 2818 square miles. Pop., 1911, 87,920. It is on the south slope of the Himalaya Range, Kunchinjunga in the north having an altitude of 28,000 feet. It is drained into the Brahmaputra by the Tista. There are valuable forests of oak, walnut, chestnut, and other trees. Copper is mined,

rice, maize, millet, cotton, tea, oranges, and other fruits are cultivated, and there is an increasing trade importing cotton-piece goods and tobacco and exporting grain and general agricultural produce. The natives are of Mongolian origin; their language is a Tibetan dialect and their religion Lamaism; they call themselves Rong-pa, but are known to the Gurkhas as Lepchas. The majority of the inhabitants, however, are Hindus in religion. Sikkim was conquered by the Gurkhas in 1789, but after the Nepal War in 1814 the independence of the Raja of Sikkim was guaranteed for his coöperation with the British. He ceded Darjeeling to the British in 1836 and opened his territory to their trade in 1861. His successor, opposing the Indian government, was kept under surveillance in India, but was reinstated in 1895, with a British officer as Resident and adviser. In 1899 the Chinese by treaty recognized the British protectorate over Sikkim. Capital, Tumlung. Consult J. Claude White, *Sikkim and Bhutan* (London, 1909).

**SIKSIKA**, sik'si-kä. See BLACKFOOT.

**SILAGE** (from *silo*, Sp. *silo*, silo, from Lat. *sirus*, from Gk. *σιρός*, *síros*, *σειρός*, *seiros*, pit for

changes are accompanied by the production of heat, the temperature sometimes rising as high as 66° C.

As shown by analysis, the cured silage does not differ materially in composition from the green crop. It is therefore essentially coarse fodder. Silage from legumes is naturally richer in protein than that from corn or other cereals. As regards digestibility silage compares favorably with the green crop from which it is made or the corresponding dry fodder.

Silage has become a very important accessory to dairy farming and has been used with success in fattening beef cattle, sheep, and horses. Originally intended for winter use, silage is now frequently put up for summer feeding when pastures are short. Animals usually eat sound silage with a relish and reject it only when decay is present. Dairy cattle should be fed relatively small amounts of silage until they become accustomed to it. In changing from grass or dry feed to silage, if a regular ration is given, the silage will perhaps slightly affect the taste of the milk for a few milkings, and if the change is from dry feed, it may cause too great activity of the bowels. Its use as a food

#### COMPOSITION OF DIFFERENT KINDS OF SILAGE

KIND OF SILAGE	Water	Fat	Protein	Crude fibre	Nitrogen-free extract	Ash

corn), or ENSILAGE. A general name applied to green crops packed and preserved under pressure in specially constructed structures (silos) or in stacks (stack silos), in each of which they undergo fermentation. The preservation of green crops in silos possibly commenced about the year 1800 and in the United States about 1875. Since then the use of silage has greatly extended.

The plants most available for silage in the United States are Indian corn, red clover, rye, oats, wheat, sorghum, the millets, alfalfa, soy beans, and cowpeas. Corn is considered most satisfactory. The entire plant should be ensiled, the best time to cut this and other crops being at maturity before the leaves turn brown or the water content begins to diminish. Corn fodder should be cut into pieces  $\frac{1}{2}$  to 1 inch long when the silo is filled, otherwise the material does not pack closely and is not convenient to handle. Silage should be well distributed and well packed along the sides and in the corners. If cut in a very dry season and not very juicy, considerable water should be poured on the silage as it goes into the silo. The silage may be fed at once, or a layer of about a foot of cut straw will prevent decay.

When green materials are ensiled, a portion of the carbohydrates, and to a less extent the albuminoids, of the plant is broken down, and acids and other simple bodies are formed. At the same time oxygen is absorbed and carbon dioxide produced. These changes result in a loss of material which ranges from 4 to 40 per cent of the original amount. The chemical

for swine has not been found successful at the agricultural experiment stations.

A cubic foot of silage under average conditions will weigh 35 to 40 pounds. Ordinarily this amount with other food is enough for one cow's daily ration, and at this rate one cow will consume about 4 tons in 200 days. Allowing for waste and emergency conditions, 50 tons is considered necessary for a herd of 10 cows for 200 days.

Approximately 8 per cent of the corn acreage in the United States in 1914 was cut for silage. This is equivalent to over 8,000,000 acres of corn. Generally speaking, three tons of silage are equal in feeding value to one ton of hay. On this basis a much larger amount of digestible food can be secured from an acre of silage corn than from an acre of hay. The food equivalent to four tons of hay can easily be produced on an acre of land planted to corn. Crops may be more compactly and economically stored as silage than as hay. See *Silo*.

**Bibliography.** J. M. Bailey, *Book of Ensilage* (New York, 1880); Woods, *Ensilage: Its Origin, History, and Practice* (Norwich, England, 1883); Thurbir, *Silos and Ensilage* (New York, 1886); H. W. Collingwood, *Conserved Cattle Food* (ib., 1892); M. Niles, *Silos, Ensilage, and Silage* (ib., 1895); Ohio State Agricultural Experiment Station, *Modern Silage Methods* (Salem, 1913); M. L. King, *Silos: Construction and Service* (St. Paul, 1913); United States Department of Agriculture, *Bulletin No. 578* (Washington, 1914); Henry and

Morrison, *Feeds and Feeding* (Madison, Wis., 1915); also *Experiment Station Record* (Washington) and publications of the various State experiment stations.

**SILANION** (Σιλανίων). A Greek sculptor of the fourth century B.C., famed for his portrait statues. The place of his birth is unknown, but he seems to have worked at Athens. He made ideal portraits of mythical or historical characters, such as Achilles, Theseus, Sappho, and Corinna. Among his portraits of contemporaries were those of Plato and the sculptor Apollodorus. His work was marked by an effort to express individual character. Consult E. A. Gardner, *A Handbook of Greek Sculpture* (2d ed., London, 1915). See GREEK ART, II (c) *Age of Praxiteles and Scopas*.

**SILAO**, sê-lâ'ô. A town in the State of Guanajuato, Mexico, 14 miles by rail from the city of that name (Map: Mexico, H 7). It manufactures cotton and woolen goods and is the centre of a rich maize and wheat district. Pop., 1910, 14,059.

**SILAS**, or **SILVANUS**. A prominent leader of the primitive Church. The name Silas is probably Semitic, Silvanus being the Latin form. Silas is first mentioned in Acts xv. 22 ff. as one of the "chief men" in the Jerusalem church and as a "prophet." (Verse 32.) With a certain Judas he was chosen to carry and explain the decision of the apostolic council to the church at Antioch. Here he probably remained, while Judas returned to Jerusalem (so Acts xv. 34 as read in some manuscripts). Shortly after this Paul chose Silas to be his companion on his second missionary journey. (Acts xv. 36-40.) He continued with Paul at least until after the work in Corinth was well under way (Acts xvi. 19 ff., xvii. 4-15, xviii. 5; cf. 1 Thess. i. 1; 2 Thess. i. 1; 2 Cor. i. 19), possibly until the return to Antioch. (Acts xviii. 22.) Acts xvi. 37 implies that Silas possessed the Roman citizenship. Apparently he did not accompany Paul on his third missionary journey or rejoin him later. 1 Pet. v. 12, if the Silvanus here is the Silas of Acts, indicates that he subsequently attached himself to Peter as companion or assistant (his amanuensis if necessary). This might explain some of the Pauline characteristics of 1 Peter. Consult A. C. McGiffert, *The Apostolic Age* (New York, 1897); Theodor Zahn, *Introduction to the New Testament*, vol. i (Edinburgh, 1909).

**SILAS MARNER**, THE WEAVER OF RAVELOE. A story of humble life by George Eliot (1861), considered by many her finest work.

**SILAY**, sê-lî'. A town of Negros Occidental, Philippines, situated on the northwest coast, 9 miles north of Bacôlod (Map: Philippine Islands, D 5). Pop., 1903, 15,649.

**SILCHER**, zilc'ër, FRIEDRICH (1789-1860). A German song composer, born at Schnaith, Württemberg. He studied with his father and Auberlen, an organist at Fellbach. He taught music while residing at Stuttgart and in 1817 received the appointment of musical director at the University of Tübingen, which position he held until within a few months of his death. His *Sammlung deutscher Volkslieder* contains many of his songs, which have become real folk songs. Among these are: "Aennchen von Tharau," "Morgen muss ich fort von hier," "Ich weiss nicht was soll es bedeuten," "Zu Strassburg auf der Schanz." Among his other works are three books of hymns, *Tübinger Liedertafel*,

and *Harmonie- und Compositionslehre*. He died at Tübingen.

**SIL/CHESTER**. A village in northern Hampshire, England, between Reading and Basingstoke. Near by is the site of the old Roman town Calleva Atrebatum. The site is inclosed by the remains of the old wall and broad ditch, but no other ruins of the city are above ground, and the place has long been under cultivation. The first systematic excavations were attempted in 1864 by Joyce. In 1890-1909 the Society of Antiquaries took up the work, and now the greater part of the ancient site has been explored. The museum at Reading has been chosen as the depository of such objects as can be transported. The wall of the ancient town forms an irregular heptagon about 1½ miles in circuit. Six gates have been found. In the centre lay the forum, an open space surrounded on three sides by colonnades with shops behind them, while on the fourth was the basilica, 270 by 58 feet. The streets divided the town into a series of blocks (*insulae*); the houses were not closely joined, but seem to have stood in their own gardens. They consist of rooms opening from a long corridor, or else of three such corridors about a square courtyard. One house of large size, with baths, is supposed to have been an inn. Three temples have been found and apparently an early Christian church (a small building with a nave, two aisles, and an apse, as well as side rooms). The place was thoroughly Romanized, as is proved by the inscriptions and the art. The earlier excavations are reported in *Archæologia*, vols. xl, xlvi, published by the London Society of Antiquaries (London, 1866-87). Beginning with vol. lii (1890) full annual reports have been published, well illustrated by plates and plans. Consult F. Havelfield, *The Romanization of Roman Britain* (3d ed., Oxford, 1915).

BLADDER CAMPION.

**SILENE**, sl-lē'nē (Neo-Lat., from Lat. *Silenus*, Gk. Σειληνός, *Seilenos*, name of a satyr). A large genus of annual or perennial plants of

the family Caryophyllaceæ, mostly natives of the northern temperate zone. Bladder campion (*Silene cucubalus*, or *Silene latifolia*), a European perennial, grows in grain fields and dry pastures, has a branched stem a foot high, bluish-green leaves, panicles of white flowers, and an inflated calyx. It is rather common from Quebec to Iowa, having been introduced from Europe. The young shoots are sometimes used like asparagus and have a peculiar flavor, somewhat resembling peas. They are best blanched. The plant has not obtained a place among garden plants. *Silene stellata*, the starry campion of the United States, quite similar to the moss campion (*Silene acaulis*), a little plant with beautiful purple flowers, grows in patches so as to form a kind of turf. It occurs in the mountains of Europe and also in America. Many species are called catchfly from their viscidty.

**SILENI.** See SILENUS.

**SILENT WOMAN, THE.** See EPIGENE.

**SILENUS** (Lat., from Gk. Σειληνός, *Seilēnos*). In Greek mythology, one of the Sileni, spirits of the springs, streams, and marshy meadows, companions of Dionysus (q.v.). They seem to belong to the Asiatic worship of the wine god; it is in Asia Minor that we find a Silenus in various legends, which, while showing the drunken, lascivious nature, also exhibit a nobler side, in which Silenus is the possessor of supernatural wisdom. Thus, after his capture through his love of wine, Silenus reveals to King Midas (q.v.) much hidden wisdom. So, also, Marsyas (q.v.) appears as a Silenus. Silenus is in the later legend a king of Nysa and the foster father of Dionysus, whom he accompanied in his journeys, borne upon an ass, whose bray struck terror to the giants and other foes. Art represented him as an old man, bald, huge of paunch, wrinkled, and in a state of jovial intoxication. He usually has beside him a wine skin and, if he walks, needs the support of friendly satyrs or is held by them upon his steed. The Sileni are usually identified with those attendants of Dionysus who have horses' ears, tails, and hoofs, or even legs, and are common on the earlier Attic and Ionic vases. Consult Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906). See SATYR.

**SILESIA**, sl-lē'shī-à or -shà (Ger. *Schlesien*). The largest of the provinces of Prussia, occupying the southeastern end of the Kingdom (Map: Germany, G 3). Area, 15,569 square miles. The southern part is traversed by chains of the Sudetic Mountains, the Reisingebirge, and other ranges, culminating in the Schneekoppe (5260 feet) and the Grosser Schneeberg (4665 feet). An extensive coal field lies in the extreme southeast and another in the Hochwald, southwest of Breslau, at a height of nearly 2790 feet. Silesia is drained chiefly by the Oder and its numerous tributaries. The Vistula takes in a small part of the east and the Oder the west. There are many mineral springs.

The climate is moderate and healthful in the lower parts, but harsh in the mountainous regions. Silesia is still preëminently an agricultural country. About 55 per cent of the total area is arable land, of which about two-thirds is divided into small holdings, while the remainder is made up of large estates. The fertile land is found chiefly between the Oder and the southwestern mountain chains; most of

the land east of the river is unfit for agriculture. Silesia stands next to Saxony among the grain-producing provinces of Prussia. The chief cereals are rye, oats, wheat, and barley. Potatoes, different kinds of forage plants, beets, and hay are also raised extensively. The forests are very extensive, and cattle raising and sheep grazing are important.

Silesia contains the richest coal deposits of Germany, and its coal mines gave occupation to over 93,000 persons in 1900. The output of coal for the year 1910 was 39,993,239 metric tons, or nearly 28 per cent of the total output of Prussia. The zinc deposits of Silesia, found in the plateau of Farnowitz, are among the richest in the world and yielded an output of over 591,154 metric tons in 1910. Iron and lead are important mineral products. The District of Oppeln is the centre of the iron industry, now highly developed. The other manufacturing industries not connected with mining are also extensive, and the industrial progress is shown by the fact that the population engaged in industrial pursuits outside of agriculture increased from 1,400,698 in 1882 to 1,742,187 in 1895, while the agricultural population for the same period shows a decrease from 1,790,934 to 1,628,105. In 1913 there were under rye 600,600 hectares; wheat, 213,000; barley, 149,000; potatoes, 339,400; oats, 389,500; hay, 347,200. The textile industry ranks next in importance to mining and allied industries, employing nearly 100,000 people. In weaving and flax spinning Silesia ranks first among the Prussian provinces. Extensive cloth, woolen, and yarn manufactures are centred at Breslau and Liegnitz. Other important products are china, earthen and stone wares, glassware, beet sugar, spirits, woodenware, apparel, etc. The chief centre of industrial and commercial activity is Breslau, the capital.

Silesia is divided into the three government districts of Breslau, Liegnitz, and Oppeln. To the Lower House of the Prussian Landtag Silesia sends 65 deputies. To the Reichstag the province returns 35 members. Pop., 1816, 1,942,000; 1864, 3,511,000; 1900, 4,668,857; 1910, 5,225,962. About one-fifth of the people are Polish. In 1910 Evangelicals numbered 2,199,114 (42.08 per cent); Roman Catholics, 2,062,783 (56.69); Jews, 44,985 (0.86). The larger cities and towns include: Breslau (pop., 1910), 514,979; Görlitz, 85,806; Königshütte, 72,641; Beuthen, 67,784; Liegnitz, 67,396; Gleiwitz, 66,981; Kattowitz, 43,173; Oppeln, 33,907.

**History.** Silesia was inhabited in ancient times by Germanic or Celtic tribes, who were succeeded by Slavic. At the end of the tenth century it came under Polish rule and was soon Christianized. From 1163 the greater part of Silesia was ruled by dukes of the Polish line of Piast. (See POLAND.) These dukes, to repopulate the country, then devastated by the numerous civil wars, encouraged the settlement of German colonies, especially in Lower Silesia. Division and subdivision of territory prevailed so extensively in Silesia that in the fourteenth century it had no fewer than 18 independent dukes. Famous among the Silesian dukes was Henry II of Lower Silesia, who fell in battle against the Mongols on the field of the Wahlstatt (Liegnitz) in 1241. In the course of the fourteenth century these petty rulers, who were constantly at war with each other, placed themselves under the overlordship of the King of

Bohemia, and Silesia was thenceforth part of the Holy Roman Empire. In 1537 the Duke of Liegnitz, one of the numerous Silesian princes, entered into an agreement of mutual succession (*Erbeverbrüderung*) with the Elector of Brandenburg on the extinction of either reigning line. The other ducal lines becoming gradually extinct, their possessions fell to Liegnitz or to Bohemia or lapsed to the Emperor. In 1675, when the last ducal family, that of Liegnitz, failed, the duchies of Liegnitz, Brieg, and Wohlau would have fallen to Prussia, but the Emperor Leopold I refused to recognize the validity of the agreement of 1537 and took possession of the Liegnitz dominions as a lapsed fief of Bohemia. The remainder of Silesia was thus incorporated in the Austrian dominions. In 1740 Frederick II of Prussia, taking advantage of the helpless condition of Maria Theresa of Austria, laid claim, on the strength of the agreement of 1537, to certain portions of Silesia. Without declaring war he marched into and took possession of the province, maintaining his hold despite the utmost efforts of Austria in the struggles of 1740-42 and 1744-45, called the first and second Silesian wars. At the close of the Seven Years' War (q.v.) in 1763 the bulk of Silesia was definitively ceded to Prussia. Parts of Silesia (Austrian) were overrun by the Russians in the Great War which began in 1914. See WAR IN EUROPE.

**Bibliography.** Franz Schroller, *Schlesien* (Glogau, 1885-88); B. Kosmann, *Oberschlesien, sein Land und seine Industrie* (Gleiwitz, 1888); Heinrich Adamy, *Schlesien nach seinen physikalischen, topographischen und statistischen Verhältnissen* (7th ed., Breslau, 1893); F. Partsch, *Schlesien, eine Landeskunde auf wissenschaftlicher Grundlage* (Breslau, 1896); *Cambridge Modern History*, vols. i, iv, vi, viii, x, xii (New York, 1902-10); Michael Morgenbesser, *Geschichte von Schlesien* (4th ed., Breslau, 1908).

**SILESIA.** A duchy and crownland of the Austrian Empire (Map: Austria, E 1). Area, 1987 square miles. The Sudetic chain enters Silesia from the west, and the Carpathians send off several spurs into the interior from the east, giving the surface an extremely mountainous character. The chief rivers are the Oder and the Vistula, both rising in the crownland. The climate is raw, but on the whole healthful. About one-half of the total area is arable land, which produces good crops of cereals and industrial plants. The census of Dec. 31, 1910, returned 31,769 horses, 196,526 cattle, 5748 sheep, 37,072 goats, and 144,209 swine. Silesia produces more coal than any other crownland of Austria; its output in 1913 was 7,594,865 metric tons, as compared with 16,459,889 tons for the Empire. Favored by its abundance of fuel, Silesia has a number of well-developed manufacturing industries. Ironware, textiles, beer, and spirits are the chief products. Silesia has a Diet of 31 members and is represented in the Lower House of the Austrian Reichsrat by 15 members. Pop., 1890, 605,649; 1900, 680,422; 1910, 756,949. Roman Catholics in 1910 numbered 639,053 (84.4 per cent); Evangelicals (Augsburg), 102,072 (13.5); Jews, 13,442 (1.8). German in 1910 was the vernacular of 325,523 persons (43.9 per cent); Polish, 235,224 (31.7); Bohemian-Moravian-Slovak, 180,348 (24.3). Troppau, the capital, had, in 1910, 30,762 inhabitants; Polnisch Osttau, 22,892; Teschen, 22,489; Biełitz, 18,568;

Jägerndorf, 16,121; Karwin, 15,761. For history, see preceding article.

**SILEX** (Lat., flint). A generic name formerly used by mineralogists to designate those minerals of which silica is the principal ingredient.

**SILHOUETTE**, sil'u-ët'. A profile drawing of a portrait, the outlines of which are filled in in black, showing a profile as if cast by the shadow of a candle. The name is derived from Etienne de Silhouette, a French minister of finance, whose measures of rigid economy in 1759 were very unpopular. The frivolous Parisians applied his name to anything parsimonious, incomplete, or imperfect, and therefore to this kind of likeness, then the mode in Paris. The black is sometimes varied by lighter lines or less shadow. Consult: Emily Jackson, *History of Silhouettes* (London, 1911); Desmond Coke, *The Art of Silhouette* (ib., 1913); E. S. Bolton, *Wax Portraits and Silhouettes* (Boston, 1914).

**SILICA**, or **SILICIC ACID**. See **QUARTZ**; **SILICON**.

**SILICIDE OF CARBON**, or **CARBIDE OF SILICON**. See **CARBIDES**.

**SILICEOUS** (sil'ish'ūs) **ROCKS**. A group of sedimentary rocks characterized by quartz as the principal constituent. Sandstone, quartz conglomerate, arkose, novaculite, and chert are the chief varieties of siliceous rocks.

**SILICON** (Neo-Lat., from Lat. *silex*, flint), or **SILICIUM**. A nonmetallic element discovered by Berzelius in 1823. Among the ancient minerals rich in silica were used in glassmaking. In the seventeenth century it was found that such minerals did not change when heated by themselves, and formed a fusible glass only when brought in contact with other bodies. In 1660 Tachenius showed that silica possessed acid rather than alkaline properties, as it combined with alkalies, but its true nature remained unknown until Davy demonstrated it early in the nineteenth century. Silicon is the most abundant of all elements in the earth's crust, excepting oxygen. It is never found isolated, but occurs in combination with oxygen as silicon dioxide or silica (quartz, flint, sand, etc.) and in various minerals in the form of metallic silicates. It also occurs in mineral springs and sea water. It was originally prepared by Berzelius by decomposing potassium silicofluoride by means of potassium in an iron tube at a red heat. When allowed to cool, the mass was treated with water, which dissolved the potassium fluoride, leaving silicon in the form of an amorphous brown powder. In 1856 Wöhler showed that sodium or aluminium may be substituted for potassium in preparing crystalline silicon by the Berzelius method. More recently silicon has been obtained by heating silica with aluminium, and since 1908 a roughly 95 per cent silicon has been manufactured at Niagara Falls by heating silica (sand) with coke in the electric furnace. Small amounts of silicon have been used in the manufacture of steel, but a very large demand for the element arose in the year 1915 in connection with the European War.

A graphitoid modification of silicon is recognized by some and may be produced by heating amorphous silicon in a platinum crucible, while a third modification, known as crystalline or adamantine silicon, is formed by heating in an earthenware crucible a mixture of three parts

of potassium fluosilicate, one part of sodium in small pieces, and four parts of granulated zinc.

Silicon (symbol, Si; atomic weight, 28.3), when in an amorphous condition, is a lustrous brown powder which does not conduct electricity and is fusible in a nonoxidizing atmosphere at a temperature between the melting points of steel and cast iron. The graphitoidal modification consists of shining metallic scales, while crystalline silicon is obtained in the form of grayish-black metal-like leaflets or needles, with a specific gravity of from 2 to 2.5 and a melting point between 1100° C. and 1300° C. (between 2012° F. and 2372° F.). Silicon combines directly with a number of the elements, forming silicides. With oxygen silicon combines to form only one oxide, the dioxide, or silica (SiO<sub>2</sub>), which is an important constituent of the solid crust of the earth and may be artificially prepared by burning silicon in air or oxygen. As flint and as sand it has many applications in the arts, as in the manufacture of glass, pottery, etc. Silicon unites with the halogens. Thus, with fluorine it forms a silicon tetrafluoride, which is a colorless gas that combines with water, forming hydrofluosilicic acid, which in turn unites with bases to form salts known as silicofluorides.

**SILISTRIA**, si-lis'trī-ā. A town of Rumania, on the right bank of the Danube, 75 miles below the important Bulgarian city of Rustchuk (Map: Balkan Peninsula, F 2). In the vicinity are vineyards and tobacco plantations, and the town produces flour and leather on a considerable scale. Pop., 1900, 12,133. Silistria was called by the Romans Durostorum and was an important city of Mœsia Inferior. It was a strong fortress under the Turkish rule and repeatedly baffled the attacks of the Russians. It belonged to Bulgaria from 1878 to 1913, when, in the course of the Second Balkan War (q.v.), it was seized by Rumania and confirmed to that Power by the Treaty of Bucharest (Aug. 10, 1913).

**SILVIUS ITALICUS**, TIBERIUS CATIUS (25-101). A Latin poet, whose name appears frequently in Martial and Pliny. In 69 he was consul and soon afterward proconsul in Asia. He was rich and luxurious, a dilettante in literature, art, and philosophy, a Stoic, and a friend of Epictetus. He starved himself rather than linger with an incurable disease. A *Homerus Latinus*, or *Pindarus Thebanus*, bears his name in acrostic at beginning and end. It is an epitome of the *Iliad*. He is better known by the *Punica*, an artificial heavy epic in 17 books, edited by Ruperti (1795-98) and by Bauer (1890-92). Consult H. E. Butler, *Post-Augustan Poetry* (Oxford, 1909), and Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part ii (3d ed., Munich, 1913).

**SILK** (AS. *seolc*, *sioloc*, *sioluc*, OHG. *silecho*, silken robe, probably from OChurch Slav. *selkū*, silk, from Lat. *sericum*, silk, neut. sing. of *Sericus*, from *Seres*, Gk. *Σῆρες*, Chinese). The fibre derived from the cocoon of the silkworm (*Bombyx mori*), or from some other form of caterpillar or spider, and woven into many useful and ornamental fabrics.

**Historical Sketch.** Silk appears not to have been well known to the ancients; though mentioned in the translations of the Bible, authorities deny that it is in the original or was known to the Hebrews. Among the Greeks, Aristotle is the first who speaks of it. From

all the evidence which has been collected it would appear that the natives of Cœs (mentioned in Aristotle) received it indirectly through the Phœnicians and Persians from China. The silken webs of Cœs found their way to Rome, but it was long before it was obtainable except by the wealthy. The cultivation in Europe of the worm itself did not take place until 530 A.D., when, according to Procopius, the eggs were brought from India (China) to the Emperor Justinian by some monks. In China the cultivation of silk is of the highest antiquity, and, according to Chinese authorities, it was first begun by Si-ling, the wife of the Emperor Hoang-ti (2609 B.C.), and the mulberry was cultivated for feeding silkworms only 40 years later.

Since its introduction into Europe silk culture has always formed a great branch of industry in Italy, Turkey, and Greece, and it has been carried on to some extent in France, Spain, and Portugal.

In early times the American colonists devoted much labor to the growth of the mulberry and culture of silkworms. In 1732 the Colonial government of Georgia allotted a piece of ground for a nursery plantation for white mulberry trees. Lands were granted to settlers on condition that they planted 100 of these trees on every 10 acres when cleared, 10 years being allowed for their cultivation. In 1740 the British Parliament passed an Act exempting from duty all raw silk certified to be the product of Georgia or Carolina. In the same year an Italian expert was sent to Georgia to conduct a filature—for reeling, etc.—and in 1759 receipts of cocoons at the filature exceeded 10,000 pounds, the quality of the raw silk being so good that it sold in London at three shillings a pound more than that from any other part of the world. After 1759, however, the production of silk in Georgia fell off greatly. Mansfield, Conn., became, in the latter part of the eighteenth century, an important silk-raising section, and this continued to be a fixed industry in that locality. Pennsylvania engaged in the culture about 1767, and a filature was established in Philadelphia in 1769 or 1770, and, in 1771, 2300 pounds of cocoons were brought there to reel. This State maintained the industry up to Revolutionary times. From the close of the Revolution to about 1825 silk manufacture in the United States was domestic, families making small quantities—hardly ever reaching 100 pounds per annum in a single family. Importation of silk goods in the meantime had increased, so that in 1821 it amounted to \$4,486,924. It was felt that this costly importation should be stayed, and congressional committees investigated the subject, and voluminous reports were made. This brought about the enthusiastic culture of the *Morus multicaulis*, which grew into a mania, during which a great many speculators and private buyers were ruined.

The result of this speculative incident, the financial depression of 1837, and the fact that in 1844 a blight affected all the mulberry trees in the country were disastrous to silk culture in the United States. In California, in 1860-75, the business was largely prosecuted, but did not succeed. In 1884 Congress began making appropriations for the encouragement of silk culture in the United States, and these, expended under the Department of Agriculture, were continued until 1890, when they lapsed until 1901. In the meantime considerable silk

was grown in Utah under State bounties, and private individuals have raised cocoons and reeled the silk on hand reels for home weaving in many other States. The climate and soil of many parts of the United States seem admirably adapted to silk culture, but as yet there are no commercial reeling establishments. The first silk mill on the Western Continent was set up at Mansfield, Conn., in 1810. The manufacture was introduced into Philadelphia about 1815, and as early as 1824 the Jacquard loom began to be used there. Power looms were next introduced, and power-loom weaving begun about 1838. From 1831 to 1839 many factories were started at Windsor Locks (Conn.), Poughkeepsie (N. Y.), Philadelphia, and elsewhere, most of which failed. Burlington, N. J., became an important silk-producing locality about 1838. The industry included the culture of the mulberry tree and the raising of silkworms, as well as the manufacture of silk. Hartford, South Manchester (Conn.), Holyoke, Northampton, and Haydenville (Mass.) are among the New England towns in which silk has been manufactured extensively. But the most important centre of this industry in America is Paterson, N. J. (q.v.), where the water power of the Passaic River, facilities for transportation, etc., offer good conditions for its prosecution. The first silk mill in Paterson was set up about 1838 in the fourth floor of Samuel Colt's pistol factory and was followed by other factories, until in the years succeeding the Civil War Paterson became, and has since remained, the chief seat of silk manufacture in the United States.

**Processes of Manufacture.** Although raw silk, unlike other textile fibres, is a continuous thread and requires no spinning, yet its preparation for the loom includes many distinct operations. After the cocoons reserved for breeding purposes are set aside, those to be used for silk are submitted to treatment that will kill the chrysalis without injury to the cocoon, just at the time when the insect has finished spinning and is ready to force its way through its covering. Several methods have been adopted for this. The chrysalis may be destroyed in an oven heated to 60° C. or 70° C. (140°-160° F.), or by placing it in the hot sun for several days under glass, or by a steam bath. The last method was invented by Professor Castrogiovanni of Turin. The cocoons are placed under an iron receiver, where steam is applied at a uniform temperature of 212° F. One objection to this process is that the pupa sometimes bursts, soiling the silk. It is said the Chinese reel off the silks from the cocoon while the silkworm is still alive.

**Reeling.** In order to be able to remove the silk from the cocoon the latter is soaked in warm water, which loosens the gummy substance binding the filaments. As a single fibre has not sufficient tenacity, from 4 to 18 filaments, according to the size of the thread desired, are taken, and two threads formed by passing them through perforated metal or porcelain guides. The threads are crossed or twisted together at a given point, and again separated and passed through a second pair of guides, the temporary twisting or crossing causing the agglutination of the individual fibres of each thread. The thread is then passed through a pair of distributing guides on to the reel. Great care and skill are required in reeling silk from

cocoons to keep the thread of uniform thickness. The threads of different cocoons are not the same length, and that from the inner part of the cocoon is finer than the outside, so the filament from another cocoon must now and then be added to keep the thread even. The common reeling machine is a simple device consisting of a reel 60 to 90 inches in diameter, adjusted in a frame which contains the guides, the water basin, and means for keeping the water warm. Steam filatures are in general use, in which the heat of the water can be regulated. Reeled silk is the raw material of the silk manufacturer, called raw silk. It is shipped by silk growers in hanks of various sizes, packed in bundles or bales.

**Silk Conditioning.** One of the most striking physical characteristics of raw silk is its avidity for moisture; it will readily absorb 30 per cent of its weight in moisture without the fact being perceptible. In order, therefore, to determine the amount of normal silk in a given bulk, the raw silk is tested in an apparatus called a desiccator. This is done by first weighing a sample, then drying it to constant weight at 105°-110° C. (220° F.), and noting the loss of weight. To the thoroughly dried silk an allowance of 11 per cent is added and the result taken as normal weight. In the great centres of silk manufacture the testing is required by buyers and is done by special houses called silk-conditioning establishments.

**Throwing.** The process of preparing the reeled silk for the loom is technically called throwing. The first step is to transfer the silk from the skeins to bobbins. The skeins, inclosed in a light cotton bag, are soaked for several hours in soapy water at 110° F. They are then dried in a hydro-extractor and stretched upon swifts—skeleton reels so adjusted that they will hold the skeins tightly. Thence they are wound on bobbins. The silk is next cleaned by passing it from one bobbin to another through the cleaner, which consists of two parallel plates so adjusted that there is just room for the thread to pass through. Adhering dirt or an imperfection in the thread at once holds the thread and arrests the motion of the spindle until the operator removes the cause. The best Italian silk does not require this process, but for Chinese silk it is always necessary.

**Doubling and Twisting** is the next process performed, and the manner in which it is done gives the name to the three different silk threads. 1. Single silk is doubled or twisted little if at all, being usually woven direct from the cleaning process. Cloth produced in this way possesses a softness and brilliancy not obtainable in that made from twisted silk. Pongee is a familiar fabric made from singles. 2. Tram silk is made by twisting two or more single threads, which are then doubled and slightly twisted. It is used for the woof thread in weaving. 3. Organzine silk is made by the union of two or more single threads, twisted separately in the same direction, which are doubled and then retwisted in the opposite direction. It is used chiefly for warp threads.

**Boiling-off** is the process applied to thrown silk to remove more or less of the glue adhering to the silk thread, so it will have a greater lustre and may be able to take a better color in dyeing. According to the amount of gum removed in scouring, silk is known as boiled, in which from 24 to 30 per cent is removed; souple,

SILK

1. UNWINDING THE COCOONS

2. REELING

in which only from 5 to 12 per cent is removed; écu, in which not more than 5 per cent is removed. The boiling-off is performed in soap-suds. The silk is now ready to be dyed, although for white or pale shades it must first be bleached in sulphur fumes.

**Shaking, Glossing, and Lustring** are supplementary processes for which special machinery has been devised, designed to develop the lustre of the silk.

**Loading or Weighting of Silk** was, in the beginning, an attempt on the part of silk dyers to make up for the loss of weight, often amounting to one-fourth, incurred during the process of boiling-off, by the use of certain chemicals which, combining with the silk, took up the dye. For a time weavers were satisfied if the dyeing process was so conducted that there was no loss of weight. But the art of imparting factitious weight to silk was soon developed to a ruinous extent. Sugar and glucose were at first the favorite agents of sophistication, but were soon abandoned for more effective materials. In black silks the extreme weighting was first practiced, a pound of silk being treated so as to weigh 100 ounces. The discovery of the use of salts of tin, however, has made it possible to weight the white and colored silks as heavily as black. By this process the durability of the silken fabric, once its most prominent characteristic, is entirely lost.

**Spun Silk.** Before winding the cocoons a flossy portion has to be removed. (See FLOSS SILK.) After the filament has been wound off another remains like a compact bag. These, together with the silk from perforated and double cocoons and the fragments of broken thread which accumulate during the process of throwing, are sold under the name of waste silk. This waste is thoroughly cleaned by washing, boiling, and drying and is then carded and spun like cotton, the yarn thus produced being known as spun silk or fleuret silk. This greatly economizes the use of silk, as the quantity of silk waste always greatly exceeds the amount of good silk reeled off. The processes employed in the production of silk yarn or floss silk, from the waste, differ little from those for spinning other materials. Four million pounds of floss silk are annually consumed in France alone. The United States imports about 6,000,000 pounds of silk waste annually.

**Wild Silk.** Many silk-producing moths exist besides the *Bombyx mori*, or cultivated moth, from which the ordinary commercial silk is derived. The one at present attracting the most attention is that from which Tussah silk is manufactured, much used in connection with ordinary silk and in the manufacture of plush. Tussah silk is the product of the moth *Antheraea mylitta*, found in India. Other wild silks are the eria silk of India, the fagara silk of China, and the yamamai silk of Japan. See SILKWORM.

**Other Silk.** A certain amount of silk is spun by many insects. The bombycid and Saturnian moths spin the largest quantity. There is a butterfly (*Eucheira socialis*), however, whose caterpillars live in an enormous silken nest. Insects of other orders, also, have smaller silk glands and secrete some silk. In the Arachnida a number of groups produce silk, the greatest amount being spun by the spiders, and many experiments have been made to place the production of spider silk upon a commercial basis.

**Silk Fabrics.** The process of weaving silk

does not differ from that of weaving other fabrics, except that in Europe for the finer grades

### RAW SILK PRODUCTION OF THE WORLD

FROM UNITED STATES CONSULAR REPORTS, JUNE 9, 1915

	Production in pounds	
	1913	1914

All other . . . . . dut.	dollars . 1,549,366
<b>Total manufactures. . . . .</b>	<b>dollars . \$5,042,670</b>

**Statistics.** According to the United States Census of 1910 there were in the country at the close of 1909 852 silk factories, with a combined

capital of \$152,158,002 and a product valued at \$133,288,072. The rapid growth of the industry during the last half of the nineteenth century and the first decade of the twentieth is shown by the fact that in 1850 there were only 67 silk factories, having a capital of \$678,300 and a product of \$1,809,476.

In 1909 there was a total of 75,406 silk looms in the United States, of which 28,915 were in New Jersey, 26,249 in Pennsylvania, 7575 in New York, 5006 in Connecticut, and 2717 in Massachusetts. During the year 1914, 51 silk mills were built, and nearly one-half of the silk product of the world was consumed in the United States. Returns for the year 1909 for the State of New Jersey gave the total number of silk establishments in that State as 348; average number of men and women employed therein, 30,285; gross value of product, \$65,-429,550.

Sadtler, *Handbook of Industrial Organic Chemistry* (Philadelphia, 1912); J. M. Matthews, *Textile Fibres: Their Physical, Microscopical, and Chemical Properties* (3d ed., New York, 1913). See also SILKWORM; SPINNING; TEXTILE MANUFACTURING; WEAVING; and bibliographies there given.

**SILK, ARTIFICIAL.** Artificial silk has been the aim of experimenters for many years. The first attempts to produce it on a commercial scale were made by Joseph Wilson Swan of Bromley, England. The Comte de Chardonnet, at the Paris Exposition of 1889, exhibited a most ingenious process of producing from cellulose an artificial fibre resembling in its characteristics and uses the true silk of *Bombyx mori*. The cellulose experimented with was principally of cotton and the pulp of soft woods. In making artificial silk from cotton by the Chardonnet method the lint is first carded into wadding, which is immersed in a mixture of 15 parts of nitric acid of 1.5 specific gravity and 85 parts of commercial sulphuric acid. This process transforms the cotton into a nitrated cellulose and continues until its color, when examined with the microscope and polarized light, is a clear blue. The next stage in the process is to press the nitrated cotton, which is then washed to remove all traces of the acid. It is then dissolved in a mixture of 40 parts alcohol and 60 parts ether, forming collodion, which requires aging in order to secure the best results. This collodion is placed in steel cylinders, and the liquid is expelled by pressure through capillary tubes into nitric acid diluted one-half with water. The fibres thus produced are wound directly upon reels and are ready for subsequent treatment. This involves the drying of the fibre by warm air and its denitration in a bath of alkaline sulphide. It then goes through additional washing and drying processes, after which it may be spun and dyed like natural silk. Many other inventors, notably Lehner and Du Vivier, followed Chardonnet, modifying his method.

A second type of artificial silk is known as the cuprammonium or Glanzstoff silk. It is made by dissolving cellulose in ammoniacal copper oxide or carbonate and forcing the solution through capillary tubes into a coagulating bath. The threads are wound on bobbins, spun, washed, soaped, and dried.

The artificial silk principally produced in the United States is commercially known as viscose. It was first prepared in 1892 by Cross, Bevan, and Beadle, of London. As manufactured in the United States, cellulose in some form, usually wood pulp, is treated with caustic soda to form a sodium cellulose and then dissolved in carbon disulphide. The product, alkali-cellulose-xanthate, is a viscous solution popularly called viscose. It is filtered, allowed to ripen by standing, and finally forced through fine apertures into a setting bath which solidifies the threads.

Artificial silk is chiefly remarkable for its brilliancy. Nitro and viscose silks are more lustrous than natural silk, but have a somewhat harsher feel. Some of the early shortcomings of the artificial product—lack of strength and elasticity and a tendency to disintegrate when wet—have been considerably lessened, and these silks are now used in fabrics for both warp and filling threads, for hosiery, dress trimmings, upholsteries, and rugs. They also take the place of real silk for insulating electric-light wires and make durable mantles for incandescent lights.

The production of artificial silk is rapidly increasing. In 1912 the world's output amounted to over 8000 tons, valued at about \$30,000,000. Consult: S. P. Sadtler, *Handbook of Industrial Organic Chemistry* (Philadelphia, 1912); Sir T. E. Thorpe, *Dictionary of Applied Chemistry* (rev. ed., London, 1913); J. M. Matthews, *Textile Fibres: Their Physical, Microscopical, and Chemical Properties* (3d ed., New York, 1913); and articles in *Textile American* (August to October, 1914).

**SILK, VEGETABLE.** A term usually applied to a soft silky fibre surrounding the seeds of the pods of certain plants of the milkweed family. It has been mixed with silk and with wool in the manufacture of certain fabrics. See SILK.

**SILK BARK.** A name given in South Africa to *Gymnosporia populifolia*, a small evergreen tree, 10 to 50 feet high, becoming a shrub in arid situations. It is of interest on account of its yielding caoutchouc, the presence of which can be readily shown by breaking even the dry twigs.

**SILK BLEACHING.** See BLEACHING.

**SILK-COTTON TREES.** See ERIODENDRON.

**SILK OAK.** See GREVILLEA.

**SILKWORM.** The silkworm of commerce is the caterpillar of *Bombyx mori*, a moth of the family Bombycidae, a group commonly known as the family of silkworm moths. The caterpillars of all the species of this group have the silk glands largely developed, and many produce large quantities of silk in making cocoons. The Bombycidae have a short and rudimentary proboscis, live only a brief period in their perfect state, and take little or no food; the body is thick and hairy, the wings large and broad, the antennae pectinated. The caterpillars feed on the leaves and other tender parts of trees or other plants; the chrysalids are inclosed in a cocoon of silk. The common silkworm is a native of either the northern provinces of China or of Bengal. The perfect insect is about an inch in length, the female rather larger than the male, the color whitish, with a broad pale-brown bar across the upper wings. The females generally die very soon after they have laid their eggs, and the males do not survive long. The eggs are numerous, bluish in

color, about the size of a pin's head, not attached together, but fastened to the surface, on which they are laid by a gummy substance which, when dry, becomes silky. They are laid about the end of June and are hatched about the middle of the following April or at the time when the leaves of the mulberry unfold.

The caterpillar is at first small—a quarter of an inch in length—but rapidly increases in size till, full grown, it is nearly 3 inches long. It is usually yellowish gray in color, but some varieties are much darker. The skin is changed four times during the growth of the caterpillar. Before each change of skin it becomes lethargic and ceases to eat, whereas at other times it is very voracious. When the skin is ready to be cast off, it bursts at the forepart, and the caterpillar then, by continual writhing, without moving from the spot, thrusts it backward. Silkworms frequently die during this change. A rapid increase of size takes place while the new skin is still soft. The natural food of the silkworm is the leaf of the white mulberry, but it will also feed on the leaves of some other plants, as black mulberry and lettuce, and in the United States it is frequently fed on the Osage orange. When so fed, however, it produces inferior silk. The silk-producing organs are two large glands (sericteria) containing a viscid substance, which extend along a great part of the body and terminate in two spinnerets in the mouth. These glands become very large when the change to the chrysalis or pupa state is about to take place.

When about to spin a cocoon, the silkworm ceases to eat and first produces the rough fibre which forms the outer part of the cocoon, and then the more closely disposed and valuable fibre of its interior. In this process the position of the hinder part of the body is little changed, but the head is moved from one point to another, and the cocoon when finished is much shorter than the body. Each fibre of silk, when examined by a microscope, is seen to be double, being equally derived from the two silk-producing organs of the caterpillar. A single fibre ranges from 800 to 1000 yards in length. The time of the silkworm's life in the caterpillar state is about four weeks. About three days are occupied in the spinning of the cocoon, after which about two or three weeks elapse in the chrysalis stage before the perfect insect comes forth.

**Diseases.** The silkworm is liable to various diseases, particularly to muscardine, pébrine, flacherie, gattine, and grasserie. Muscardine (q.v.), commonly known as silkworm rot, is due to a fungous growth within the caterpillar. A worm so affected becomes dull white, sluggish, and soon dies. A few days after death it becomes hard, red, and floury. The cause of the disease was discovered by an Italian, Bassi, and the fungus is called *Botrytis bassiana*. Pébrine, unquestionably bacterial, is an hereditary disease and probably contagious and infectious. It is the most fatal of silkworm diseases. By 1847 its ravages in France compelled the French to get their silkworm eggs from Italy. The disease spread to Italy, and then the eggs were procured from the Danube, then from China, and in 1865 healthy eggs could be obtained only from Japan. Pasteur showed that selection and isolation of healthy moths is the only remedy. With the methods of isolation and care against contamination such as are at present practiced,

France now supplies her own market and exports 300,000 ounces of silkworm eggs annually. In worms affected with flacherie the food ferments in the alimentary tract and sustains vibrios and certain fungi. This disease is probably induced by improper care of the eggs. Gattine is probably only a modification of flacherie. The cause of grasserie (q.v.) is unknown. It is the least fatal of silkworm diseases. To keep silkworms healthy they must be reared in a suitable and constant temperature. Humidity, ventilation, and cleanliness must be strictly and constantly attended to. Lime is used for whitewashing the walls and buildings in which worms are reared, and sulphur fumes for sterilizing trays.

**Culture of Silkworms.** The leaf of the white mulberry (*Morus alba*) is apparently the natural food of the domestic silkworm. There are many horticultural varieties of this plant, some much better adapted than others to commercial silk culture, and some better suited to certain localities. The *Morus moretti*, the *Morus multi-caulis*, and the black mulberry (*Morus nigra*) are also used. The red mulberry (*Morus rubra*) does not make good food, and the paper mulberry (*Broussonetia papyrifera*) is also valueless. The best varieties of mulberries are propagated by means of seeds and by cuttings. The trees should be planted well apart and should be pruned so as to form a short trunk and a close low head. Silkworm eggs are kept through winter at a low temperature, the embryo beginning to take form when the temperature rises above 50° F. The receptacle in which they are stored should be ventilated, the air should not be moist, and great care should be taken to keep them out of the reach of mice and insects. The eggs are hatched in an artificial incubator or by natural heat. When an incubator is used the temperature should be gradually increased until 73° F. is reached. The whitening of the eggs denotes the nearness of hatching. The eggs should then be covered with sheets of tulle or finely perforated paper, sprinkled with finely cut white mulberry leaves. The young caterpillars will at once mount to the leaves and should be fed eight to ten times during 24 hours. After each feeding the lower sheet of paper or tulle should be removed with the frass. About the sixth day they will begin to molt and pass into the second stage. As the worms increase in size, paper in which the perforations are larger should be used, and the same general directions followed for each stage until the fifth has been reached.

The worms have now grown to nearly full size, are very voracious, and it is difficult to satisfy their appetite. After five days in the fifth stage they are ready to spin. In making preparations for spinning, dry brush, bundles of straw or shavings or finely split-up wood may be used. The brush or straw should be placed upright between the feeding shelves, in rows about 16 inches apart, the tops spread to form arches and allow the worms plenty of room to spin. The temperature during spinning should be 75° F., and the humidity throughout the rearing about 65°. The rearing room should be well ventilated, and before introducing the worms should be disinfected with chloride of lime or sulphur. One ounce of eggs contains approximately 40,000, and the space required may be estimated by allowing 1 square yard for this amount at birth, on the fourth day

2 square yards, for the second stage 4 square yards, three days later 8 square yards, for the third stage 16 square yards, and for the fourth stage 32 square yards, and for the fifth stage 60 square yards. Plenty of space is desirable, since when crowded the worms will not be so robust. A mean temperature of about 74° F. is the best. There are many commercial varieties of the silkworm graded according to the size, color, and quality of the cocoon. When the cocoons are completed, which is known by the absence of any sound within, they are carefully sorted and a certain number kept for laying. The sexes are readily known by difference of shape as well as of size, the female being plumper; the male, much smaller, having a central depression and sharper extremities. The French growers sort them into nine varieties, those which are less compact or in which the worm has died—a fact known by external indications—being separated from the good ones. When the sorting is finished the cocoons are placed in an oven with a gentle heat, which kills the inclosed chrysalis, otherwise they would all become perforated by the insect eating through. The cocoons are then ready for the first stage in the manufacturing process, which consists in the removal and winding of the fibrous covering as described under SILK.

**Other Silkworms.** It is supposed by some entomologists that the original wild silkworm from which descended the silkworm of commerce is a species known as *Theophila huttoni*, which occurs in Japan, the northwest Himalaya, and Assam. The moth is of the same size as that of *Bombyx mori*, light brown, with the characteristic markings on the wings. The larva almost precisely resembles the domestic silkworm, but has a pair of small black thorns on the back of each segment of the abdomen. It seems very unlikely, however, that this species could have been the ancestor of *Bombyx mori*, since it lacks palpi, which are present in the *Bombyx*.

Oriental people have utilized the cocoons of a number of species of bombycid moths in the manufacture of silk goods. The so-called tussah, tusseh, or tusser silkworm is *Antheraea mylitta*, a species occurring in China, India, and Ceylon. In Upper India this silk is extensively produced, and the cocoons are collected in the jungle districts by the Sahars and other half-wild castes who live in such places. Other silkworms which are said to be used in the manufacture of tussah silk are *Antheraea pernyi*, from China; *Antheraea assama* (*Saturnia perottetti* and *Antheraea mezanckooria* are synonyms of this species), a native of Assam and there called moonga or moogha; *Antheraea roylei*, from India; *Antheraea helferi*, from Sikkim; *Antheraea jana*, from Java; *Antheraea frithii*, from Sikkim, Bhutan, and Darjeeling; and *Antheraea larissa*, from Java. The very large and beautiful *Attacus atlas*, from India, Ceylon, Burma, and Java, is said to produce cocoons used for tussah silk.

The wild silkworms which have received the most attention in Europe, however, are *Antheraea yamamai*, from Japan, commonly known as the yamamai silkworm; *Antheraea pernyi*, from China; and *Philosamia cynthia*, from Japan, China, the Himalaya, Assam, and Java, which has been introduced into Europe and which has been acclimatized in the eastern United States. Its larva is commonly known as the ailanthus silkworm, while the yamamai and

pernyi silkworms are commonly known as oak silkworms.

The yamamai silkworm is commonly raised in Japan, and its cocoon is large, heavy, handsome, and of a yellowish-green color. It is readily reeled, and its silk ranks commercially next to that of the domestic silkworm. The silk is strong and valuable. It bleaches well and may then be dyed. Fewer threads are required to make a strand than with *Bombyx mori*, and the cocoons unwind with perfect ease by the ordinary process. The life of the worm lasts from 50 to 80 days, and it feeds on all kinds of oak, but prefers those of the white-oak group. The pernyi silkworm has been cultivated in Europe with better success than the yamamai. It develops more rapidly, is double-brooded, and passes the winter in the chrysalis state. The cocoon is not so valuable, though ranking probably third best among the different silkworm cocoons. The ailanthus silkworm is utilized extensively in north China. It has been known in Europe since the middle of the last century and has been cultivated there as well as in the United States with perfect success. The cocoons, however, cannot be reeled successfully, and their silk is utilized principally by carding processes.

In the United States several species of silkworm moths occur, and their caterpillars spin an abundance of silk of a strong and durable quality. The American silkworm (*Telea polyphemus*) is a large moth of a buff color, whose caterpillar feeds upon the leaves of many trees, including oak, willow, hickory, maple, apple, sycamore, and many others. The cocoon is formed of strong silk, which when unwound has a glossy fibre. It is oval and closed at both ends, dense, and generally fastened to a leaf or leaves, with which it sometimes falls to the ground. The fibres are intermixed and cemented with a gummy substance which when dry gives the cocoon a chalky appearance. The principal difficulty in reeling the cocoon is in the hard matter which binds the threads. This, however, may be softened, and no doubt the cocoon could be improved by a process of continued selection. The insect has one generation each year in the Northern States, two in the Southern States, and passes the winter in the chrysalis state.

The large luna moth (*Tropæa luna*) is a beautiful species of a delicate green color, with long tails to the hind wings, whose larva feeds on several forest trees and whose cocoon is less dense than that of the polyphemus moth. The cocoons of these two species have the same general characteristics as those of the yamamai silkworm. Another native North American silkworm (*Callosamia promethia*) resembles in many respects the ailanthus worm. Its cocoon, like that species, is open and is in the same way difficult to reel. It feeds on ash, sassafras, wild cherry, maple, lilac, birch, and other trees. The largest of the American silkworms is the larva of *Samia cecropia*, a beautiful moth of a grayish-brown color marked with reddish and yellow spots and bands. The large green larva, which bears six coral-red tubercles on its thorax and smaller blue tubercles on its abdomen, feeds upon the apple and other rosaceous plants, as well as upon hazel, hickory, maple, willow, and honey locust. The cocoon is peculiar in being apparently double. There is a thick, wrinkled outer layer which resembles strong

brown paper and which covers an inner oval cocoon composed of the same kind of silk, but closely woven like that of the mulberry silkworm. Nearly related to this species are *Samia gloveri*, of the Rocky Mountain region; *Samia columba*, of the North Atlantic States; and *Samia rubra*, from the Pacific States. In Mexico there are several large silkworm moths of the Saturnian group which produce quantities of silk, but it has not been commercially utilized or experimented with. There is another group of moths belonging to the family Psychidae, in which the larva makes a large bag of silk which it carries about with it to protect its soft body from the attacks of birds. A common American example is the bagworm (q.v.) or basket worm. This silk has not been utilized except in China.

Riley, in *Fourth Annual Report State Entomologist of Missouri* (Jefferson City, 1872); id., "The Mulberry Silkworm," in *Division of Entomology, United States Department of Agriculture, Bulletin No. 9* (Washington, 1886); H. A. Kelly, "The Culture of the Mulberry Silkworm," in *Bulletin No. 39* (ib., 1903); A. M. Villon, *La soie* (Paris, 1890); Verson and Quajet, *Il filugello e l'arte sericola* (Padua, 1896); C. W. Oliver, *Mulberry and Other Silkworm Food Plants* (Washington, 1907). See SILK.

**SILKWORM GUT.** A material used to form the hook end of a fishline. Its advantages are its extreme tenacity and transparency or invisibility in water. It is prepared from the viscid secretion found in the silkworm (q.v.) just before the worm begins to spin. The grub is immersed in strong vinegar for several hours, and the substance which, if it had lived, would have formed the cocoon is forcibly drawn from the dead worm. This thread is first soaked in cold water and then in a caustic solution. This loosens the outer covering, which is next removed. The silk is then dried in a shady place. If simply dried it will be of a yellowish hue; the pure white thread is produced by bleaching in sulphur fumes. The manufacture of gut strings is carried on in Italy and Greece and other silk-growing countries, but particularly in Spain, the principal market being Valencia. It takes from 20,000 to 30,000 threads to make a pound.

**SILKWORM ROT.** See MUSCARDINE.

**SILL, EDWARD ROWLAND** (1841-87). An American poet and essayist, born at Windsor, Conn. He graduated at Yale in 1861, resided till 1866 on the Pacific coast, studied theology at Harvard, and after several years of teaching and literary work in Ohio, was appointed in 1874 professor of English in the University of California. Sill returned to Ohio in 1882, residing at Cuyahoga Falls until his death. He wrote: *Hermione, and Other Poems*; *The Hermitage, and Later Poems* (1867); *The Venus of Milo, and Other Poems* (1882). After his death a collection of essays and letters appeared (1890) as *Prose*. In 1906 his collected *Poetical Works* were published by W. B. Parker, who in 1915 wrote *Edward Rowland Sill: His Life and Work* (Boston). The small poetic production of Sill, who was a man of rare temperament and insight, is notable for carefulness of diction, delicacy of feeling, and a dominating strain of spiritual optimism.

**SILLIMAN, BENJAMIN** (1779-1864). An American scientist, born Aug. 8, 1779, at North

Stratford (now Trumbull), Conn., the son of Gold Selleck Silliman, a general in the army of the Revolution. After graduating at Yale in 1796, he studied law, became a tutor in Yale, was soon chosen to be a professor of natural science, and went abroad to fit himself for the chair in which he became a teacher of chemistry, mineralogy, geology, and pharmacy. He held his professorship in Yale from 1802 to 1864—from 1853 onward as professor emeritus. He was honored and beloved as a teacher and acquired even greater distinction as a lecturer, especially on geology. These courses began at New Haven in 1831 and were so much appreciated that Silliman was selected to give 24 lectures before the Lowell Institute of Boston in its first session (1839-40). In 1818 he established the *American Journal of Science* (often quoted as "Silliman's Journal"), the editorship of which long remained in his family. With Dr. Robert Hare he constructed the compound blowpipe. He published after his return from England a narrative of his journey, and 50 years later, at the end of a second journey, he published a similar memoir. His *Tour to Quebec* (1819) was likewise widely read. His contributions to science were not numerous, one of those most famous at the time being an account (with J. L. Kingsley) of a remarkable meteor which fell at Weston in 1807. During his long career Silliman was an active participant in all the affairs of Yale College—the organization of the Medical School, the formation of a cabinet of minerals, the acquisition of Colonel Trumbull's paintings, and the purchase of the Clark telescope. He died Nov. 24, 1864. Consult the *Life* written by G. P. Fisher (2 vols., New York, 1866), largely from material left by Silliman and containing many entertaining reminiscences, and D. C. Gilman, in *Leading American Men of Science* (ed. by D. S. Jordan, New York, 1910).

**SILLIMAN, BENJAMIN** (1816-85). An American chemist and toxicologist, son of Benjamin Silliman. He was born in New Haven, Conn., and, after graduating at Yale College in 1837, became an assistant to his father. In 1842 he fitted up in one of the college buildings a chemical laboratory, out of which grew the foundation in 1847 of the Yale (now Sheffield) Scientific School. He was professor of medical chemistry and toxicology in the University of Louisville, Ky., from 1849 to 1854. In 1854 he succeeded to his father's chair at Yale. This he resigned in 1870, continuing, however, to lecture in the medical department until his death. He gave popular lectures on scientific topics throughout the country, examined mines, prepared reports on processes in chemical manufacture, conducted researches, and was one of the editors of the *American Journal of Science*. He was the author of *First Principles of Chemistry* (1846; 2d ed., 1856); *First Principles of Physics* (1858; rev. ed., 1868); *American Contributions to Chemistry* (1875). Consult A. W. Wright, in the *National Academy of Sciences, Biographical Memoirs*, vol. vii (Washington, 1911).

**SILLIMANITE** (named in honor of Benjamin Silliman). A silicate of aluminium chiefly occurring in long slender crystals, in parallel groups, and in fibrous masses, brown or gray in color and extremely tough in tenacity. It occurs in gneiss, mica schist, and other crystalline rocks. The fibrous varieties are commonly

called fibrolite (q.v.), while the name "silimanite" is given to those varieties that are found in the form of long slender crystals.

**SILLO.** An air-tight storage room, either above ground or below, in which green crops usually cut small are tightly packed for future use; also a stack in which the feed is preserved under pressure. The first silos made in the United States were of brick or stone, lined with a smooth coating of cement. Wooden silos were later found to be satisfactory and much less expensive. These are circular in form, built of staves held together by iron hoops, and rest upon a concrete foundation. A continuous opening down the side, closed by sections removable as needed, enables the silage to be taken out conveniently. The concrete form is more durable although more expensive than the wooden silo. Silos are commonly roofed over at the top. Where the climate is dry, pit silos have been used successfully. Consult: Rabild, Risser, and Parks, "Homemade Silos," in *United States Department of Agriculture, Farmers' Bulletin* 589 (Washington, 1914); *Concrete Silos*, published by Universal Portland Cement Company (Chicago, 1914); and files of *Experiment Station Record*. See **SILAGE**.

**SILLOAM** (Heb. *Shiloah, Shelah*, Gk. *Σιλωάμ*, modern *Birket Silwan*). A pool situated at the southern end of the eastern hill of Jerusalem, mentioned in Neh. iii. 15 and John ix. 7. Isaiah (viii. 6) speaks of the "waters of Shiloah that go softly." The water in this pool is supplied by the Virgin's Spring and is brought to the pool at the entrance to the Tyropoeon valley by a tunnel over 1700 feet in length. The tunnel is rather winding and about 19 feet from the Siloam end an important inscription was found in the wall in 1880. As translated by Driver, it reads: "(Behold) the piercing through— And this was the manner of the piercing through. Whilst yet (the miners were lifting up) the pick, each towards his fellow, and whilst yet there were three cubits to be cut (through, there was heard) the voice of each calling to his fellow, for there was a fissure in the rock on the right hand. . . . And on the day of the piercing through the miners smote each so as to meet his fellow, pick against pick; and there flowed the water from the source to the pool, 1200 cubits; and 100 cubits was the height of the rock over the head of the miners." Hence the cutting was evidently done simultaneously from both ends. In default of any date there has been much controversy as to the age of the inscription. It has generally been assigned to the time of Hezekiah, who is said to have "made the pool and the conduit, and brought water into the city" (2 Kings xx. 20). But it cannot be denied that the form of the letters resembles those of a later age more than those of our earliest inscriptions. Pilcher assigns the inscription, on paleogeographical grounds, to the time of Herod, Stanley A. Cooke to c.200 B.C. Their arguments are not conclusive, however, and Driver leaves the question open. The aim in conducting the waters through the tunnel into a pool of the Tyropoeon valley was to make it more accessible to the inhabitants of the lower part of Jerusalem. Consult: Tobler, *Die Siloahquelle und der Oelberg* (Saint-Gall, 1852); A. Socin, *Die Siloahinschrift* (Freiburg, 1899); *Proceedings of the Society of Biblical Archaeology* (London, 1897, 1909); S. R. Driver, *Notes*

*on the Hebrew Text and Topography of the Books of Samuel* (2d ed., Oxford, 1913).

**SILLOTI**, sē'lō-tō, ALEXANDER (1863– ). A famous Russian pianist, born near Kharkov, South Russia. He studied at the Moscow Conservatory under Tschaiakowsky, Nicholas Rubenstein (qq.v.), and Zveriev, making his début at Moscow in 1880. After a successful appearance at Leipzig (1883), his fame as a virtuoso became world-wide. Nevertheless, at various times till 1886, he studied with Liszt. He taught piano at the Moscow Conservatory from 1880 to 1890, after which he went abroad. His concert tours included one in the United States (1898). Returning to Russia, he became actively interested in orchestral and chamber music, conducting concerts in Moscow, St. Petersburg, and other cities.

**SILPHIUM** (Lat., from Gk. *σίλφιον*, a sort of umbelliferous plant, the juice of which was used in food and medicine). A genus of about a dozen tall, coarse, American perennial plants of the family Compositæ. They have a copious resinous juice and large corymbose-panicled yellow flowering heads. *Silphium laciniatum*, called rosinweed, is rough and bristly, grows from 3 to 6 and sometimes 10 feet high, and has pinnately parted leaves. It grows on the prairies of Michigan, Wisconsin, and southward and westward, and blossoms in July. It is called compass plant (q.v.), from the turning of its lower leaves so that their edges point north and south. Another species, *Silphium terebinthinaceum*, the prairie burdock, grows from 4 to 10 feet high and has many small heads in a panicle at the top.

**SILURIAN SYSTEM** (from Lat. *Silures*, a people of ancient Britain). A division of the Paleozoic group of rocks established by Murchison (q.v.) to include the strata between the Archean and Devonian systems. It was subsequently restricted to the two groups now known as the Ordovician or Lower Silurian and Upper Silurian or Silurian proper. These two extend from the upper limits of the Cambrian to the base of the Devonian. Silurian rocks, using the term in the narrower sense to embrace the upper of the two groups, are extensively developed in both the United States and Europe. The rocks, as illustrated by the classic New York section, are divided as follows:

Silurian system	{	Cayagan	Manlius limestone
			Rondout waterlime
	{	Niagaran	Cobleskill limestone
			Salina beds
			Guelph dolomite
	{	Oswegan	Lockport dolomite
			Clinton beds
			Medina sandstone
			Oswego sandstone

The rocks are largely limestones, but with beds of shales and some sandstones interstratified. While there was some disturbance at the end of the Ordovician era, it was not sufficiently extensive in America to change materially or increase the extent of the land surface existing in Ordovician times. Silurian rocks are present in great thickness in the Eastern States, especially along the Appalachian region. West of this region they appear in Ohio, Kentucky, Tennessee, Missouri, Illinois, and Wisconsin, though on the whole not so well developed. In the Rocky Mountain area they have limited distribution.

The lowest or Oswego stage is made up mostly of gray thin-bedded sandstone. The next mem-

ber is the Medina sandstone, which occupies a belt along the southern shore of Lake Ontario and attains a thickness of 1200 feet in western New York. It is characteristically a hard fine-grained sandstone, formed in shallow water. It shows many ripple marks. Overlying this is the Clinton shale, well known from New York down into Georgia and westward into Wisconsin, in which region it changes into limestone, indicating that the Silurian seas were deeper in that area than farther east. A subsequent deepening of the water over a still greater area is indicated by the formation of the limestones or dolomites, which are well developed in the gorge of Niagara River and whose resistance to erosion causes the abrupt descent of the Niagara River at the Falls. The Niagaran limestones range over a very large territory westward to Wisconsin and then southward through Illinois into Missouri and west Tennessee. Small areas are also found in Iowa, the Black Hills, and Nevada. Following this great limestone deposit comes a series of shallow-water deposits of salt, gypsum, and shale of the Salina stage, which are well developed in New York and Ohio, but thin out in Pennsylvania. In some localities an argillaceous limestone was deposited during the same period, to which has been given the name of water lime for its value in the manufacture of cement. On top of these beds lie great beds of limestones due to the deepening of the water in which the Silurian sediments were being deposited. The limestones of the Cayugan series are also known as the Lower Helderberg formations. It is probable the depression made at this time submerged some areas which had been dry land since Ordovician times, as in some cases we find the Cayugan rocks resting directly on Ordovician strata. The Lower Helderberg limestones are abundant in New York, where they form the bold escarpment of the Helderberg Mountains near Albany, but are also known to extend southward through Pennsylvania to Virginia, while additional deposits are known in west Tennessee and Maryland.

Silurian beds are well developed in Europe, China, northern Africa, South America, and Australia, as well as in North America. At the termination of the Silurian there was a gradual transition into the Devonian, so that it is often difficult to determine the boundary line between the rocks of the two systems.

The plant life of the Silurian, as revealed by the fossil remains, was scanty. Seaweeds were abundant, but land plants are rarely found. Among the animals there was a great development of invertebrates. Sponges, corals, crinoids and starfishes abounded in the seas, and trilobites also flourished, although not so numerous as in Ordovician time. Some insects have also been found, such as scorpions, proving that there must have been land vegetation. The brachiopods continued in countless numbers, and the genera were quite different on the whole from those of the Ordovician. The bivalve mollusks were similar to those of the Ordovician, but other orders showed more or less change. The only vertebrates known to have existed were fishes such as ostracoderms and sharks, but their remains are rather fragmentary.

The economic minerals of the Silurian are fairly diversified. In the rocks of the Clinton age we find a very persistent bed of the hematite iron ore of oolitic or fossiliferous character. Wherever the Clinton rocks are found this ore

is liable to occur and forms the basis of the iron industry at Birmingham, Ala., where a deposit several miles long and from 12 to 20 feet thick is worked. In the rocks of the Salina stage we find the deposits of gypsum and rock salt, the latter material being of great economic value in the State of New York. The limestones of the Cayugan series are quarried for building stone and cement manufacture and the Medina sandstone is used extensively as a structural material.

**SILURIDÆ.** A very large family of soft-rayed fishes. See CATFISH.

**SILVA, sêl'vâ, ANTONIO JOSÉ DA** (1705-39). A Portuguese playwright who became a victim of religious fanaticism and was burnt at the stake by the Obscurantists, Oct. 18, 1739. Silva was the son of a converted Jew. His *Operas* are often coarse and rough, but full of wit and humor of a popular kind. Consult: Ernest David, *Les opéras du Juif Antonio José da Silva* (Paris, 1880); "Portugiesische Litteratur," in Grüber, *Grundriss der romanischen Philologie* (Strassburg, 1897); G. A. Kohut, *Bibliography of Works Relative to Antonio José da Silva and Bibliography of Don Antonio's Compositions*, in *American Jewish Historical Society, Publications*, No. 4 (Baltimore, 1896).

**SILVA, JOÃO MANOEL PEREIRA DA.** See PEREIRA DA SILVA, JOÃO.

**SILVA LEITÃO, JOÃO BAPTISTA DA.** See ALMEIDA-GARRETT.

**SILVANUS.** In Latin mythology, a divinity of the fields and forests, the protector of fields and of cattle. He is by later writers identified with Pan, Faunus, and other divinities and is represented by the poets and in art as an old man in love with Pomona. He is especially associated with the cypress and the pine. Sacrifices to him consisted of grapes, grain, meat, milk, wine, and pigs.

**SILVANUS.** A leader of the primitive Christian Church in Jerusalem. See SILAS.

**SILVELA, sêl-vâ'la, FRANCISCO** (1843-1905). A Spanish statesman, orator, and Academician, born at Madrid. He studied law and in 1869 was elected to the Cortes as a Conservative. In 1879 he became Minister of the Interior (under Martínez Campos), and from 1883 to 1884 he was Minister of Justice. After the death of Cánovas, Silvela, as the head of the reorganized Conservative party, became Prime Minister in February, 1899. He resigned in October, 1900, but after the fall of Sagasta resumed office, in December, 1902. In 1903 he retired from politics. He was a member of the Royal Spanish Academy of the Language and of

the Royal Academies of History, Moral and Political Sciences, and Fine Arts.

**SILVER** (AS. *seolfor*, *seolubr*, Goth. *silubr*, OHG. *silabar*, *silbar*, Ger. *Silber*, silver). A metallic element, known to the ancients and when first mentioned referred to as a medium of exchange. It is described in early Hebrew writings under the name *Késeph*, the root of which signifies "to be pale," while among the Greeks it was known as *ἀργυρος*, *argyros*, signifying "shining." The alchemists called it *luna* or *Diana* and referred to it in their writings by the crescent symbol. It occurs native, and specimens weighing several hundred pounds have been found, although it usually occurs in combination, as given below in the table of ores. It also occurs in lead and copper ores, the former being an important source of its production. It is found in sea water, and small quantities in the form of chloride have been detected in volcanic dust. It has never been commercially extracted from these sources. The metal may be readily prepared by heating silver sulphide with litharge or lead sulphate, the lead being separated from the resulting alloy by cupellation. Metallic silver may be obtained by reducing silver chloride with zinc or by fusion with carbon and sodium carbonate.

Silver (symbol Ag.; atomic weight, 107.88) is a white lustrous metal, very malleable, with a specific gravity of 10.57 and a melting point of 961° C. (about 1761° F.). Of all metals it is the best conductor of electricity; it is also an excellent conductor of heat. It is ductile and capable of taking a high polish. It crystallizes in regular forms, such as the cube and octahedron. A thin film of silver transmits blue light. When in the molten state it possesses the power of absorbing 22 times its volume of oxygen from the air, giving this up on solidification. When a mass of the molten metal is rapidly cooled, the silver solidifies before the oxygen has escaped from the interior, and this gas then bursts through the crusts, driving out part of the fused silver in globular masses and excrescences—a phenomenon known as spitting. Silver finds extensive use in coinage and for tableware and decorative articles; for silver plating, silvering mirrors, and to a slight extent for laboratory purposes. A large amount finds use in photography. Silver forms alloys (q.v.) with many metals, and that consisting of 9 parts of silver to 1 part of copper is the standard alloy used for the United States coins, while 835 parts silver to 165 parts copper, called "standard" silver, is the standard employed in the countries included in the Latin Union.

With oxygen silver forms three oxides, an argenteous oxide or suboxide, a protoxide or normal oxide, and a peroxide or dioxide. Of these the protoxide is the most important. It is obtained as a brown, pulverulent precipitate when silver nitrate is treated with potassium or sodium hydroxide. This compound is used to give a yellow color to glass and finds some employment in medicine as a substitute for silver nitrate. Silver nitrate, or lunar caustic, is prepared by dissolving silver in nitric acid and evaporating to crystallization. The crystals are large, colorless, and transparent and blacken upon exposure to light or in contact with organic matter. Silver nitrate may be fused and is often cast into sticks, the usual form in which the compound is used as a caustic in

medicine, etc. The nitrate is also the basis of many indelible inks, and is the form in which some of the silver is used in photography. The haloid salts of silver include the chloride, iodide, and bromide. They occur in nature but rarely and are not usual in ores. They may be prepared by the action of soluble iodides, chlorides, or bromides upon a solution of silver nitrate. The haloid salts are sensitive to light action and for this reason are much used in photography. Silver sulphide is formed by the action of sulphur or sulphurous gases upon silver or its compounds. It is the black tarnish formed upon domestic silverware upon continued exposure and is the basis of the so-called "oxidized" finish upon articles of art. The tarnish may be removed by a weak solution of potassium cyanide.

**Silver Ores.** The following table gives the composition of the principal silver ores, grouped approximately in the order of their importance:

NAME	Combining element	Formula
Native silver . . . . .	Ag.	Often in alloys
Argentite . . . . .	Sulphur . . . . .	Ag <sub>2</sub> S Ag = 87.1%
Proustite (Light ruby silver) . . . . .	Arsenic and sulphur . . . . .	Ag <sub>2</sub> AsS <sub>3</sub> Ag = 65.4%
Pyrargyrite (Dark ruby silver) . . . . .	Antimony and sulphur . . . . .	Ag <sub>2</sub> SbS <sub>3</sub> Ag = 59.9%
Stephanite (Brittle silver) . . . . .	Antimony and sulphur . . . . .	Ag <sub>2</sub> SbS <sub>4</sub> Ag = 68.5%
Cerargyrite (Horn silver) . . . . .	Chlorine . . . . .	AgCl Ag = 75.3%
Hessite . . . . .	Tellurium . . . . .	Ag <sub>2</sub> Te or (AgAu):Te
Tetrahedrite (Fahl ore) . . . . .	Complex mixture of antimony or arsenic sul- phides with silver sul- phides and base metals	Very Complex
Dyscrasite . . . . .	Antimony . . . . .	Ag <sub>2</sub> Sb or AgSb

**Occurrence.** Most of these silver minerals occur in combinations and mixtures in natural deposits, and ores received at metallurgical works almost invariably consist of several different minerals. When found at all, native silver and the haloid compounds usually occur in the upper portions of the deposits, while the sulphides, arsenides, antimonides, and other complex minerals are found in the lower portions, usually below ground-water level. This is subject to some variation, since it is well known that native silver occurs with some of the most highly complex minerals near the surface in the Cobalt silver district of Canada. Dyscrasite, one of the usually uncommon minerals, is commonly found in the Cobalt ores. Tetrahedrite occurs in most cases alone. The minerals containing silver as a more or less accidental ingredient are galena, sphalerite, chalcocite, pyrrhotite, pyrite, bournonite, chalcocite, boronite, native arsenic, arsenopyrite and certain nickel, cobalt, and bismuth ores. Galena often contains silver up to 1 per cent, or 291 ounces to the ton, so that at times the value of the silver in ore is greater than that of the lead. Montana in 1920 was the leading silver producing State, most of the metal coming from copper ores mined around Butte or from smelting the residues of zinc ores. The Cœur d'Alene district of Idaho is also an important mining region where the silver output is a by-product of lead

and zinc. These deposits were primarily largely valued for their silver values, which formed a great portion of the surface ores, but are now principally worked for their lead and zinc content, although the silver is an additional asset that helps materially towards the total values recovered. In Europe the greater portion of the silver production is derived from galena ores, and in the United States a large percentage of the lead is obtained from argentiferous ores. Copper ores frequently contain considerable silver, notably in the Butte district of Montana. In one of the mines of this district, the Butte & Superior, silver occurs with a zinc mineral. The famous copper-bearing schist of Mansfeld, Germany, also carries silver.

Silver ores occur in the rocks of various geological ages—in gneiss and allied rocks, in porphyry, trap, sandstone, limestone, and shales. The veins often intersect eruptive rocks, as trachyte or porphyry, or the sedimentary formations in the vicinity of such rocks, and have often owed their existence to the dynamic processes and vapors from below attending eruptions. The usual gangues are calcite or quartz and frequently dolomite or barite.

**Production.** For many years the silver mines of Mexico have been by far the richest on record, and, in spite of the former imperfect methods of mining and transportation, and disturbed political conditions, Mexico has produced more than one-third of the total output of the world's silver, one-half of the production of the Republic having been derived from the central mining districts of Guanajuato, Zacatecas, and San Luis Potosí. Until 1860 Bolivia and Peru, followed by Chile, were next to Mexico in importance of silver production. Subsequent to 1895 the remarkable development of silver mining in the western part of the United States has increased the output so that it took rank second to that of Mexico, and at present these two countries supply over three-quarters of the world's total annual production of this metal. The Comstock lode in Nevada was the greatest silver-producing locality in the history of the United States, but its present output is insignificant. The principal silver camp in 1921 was Tonopah, Nev., possibly the most important of the world's natural silver centres. There are other smaller but important camps in Nevada, while there are several in Colorado, Idaho, and other of the Western States. In Europe Spain has been the most productive country. The richest mines are in the Province of Guadaluja. They were extensively operated as late as 1846, but recently the quality of production has decreased. Czecho-Slovakia, Saxony, and Harz Mountain district in Germany contributed largely to the total output of Europe, but war and after war conditions acted against the mining industry. The silver mines of Norway, at Kongsberg, have long been famous, although their present output is not important. The mines of Laurion in Attica, famous in antiquity for their large production of silver, have been worked mainly for lead.

The annual silver production of the United States increased steadily from an average of about 600 kilograms in 1834 to a maximum of 74,961,075 fine ounces (2,225 000 kilos approx.) in 1915, from which it fell off to 55,361,573 fine ounces in 1920 (1,720,000 kilos approx.). The total reported production during this period was approximately 2,559,401,596 fine ounces or ap-

proximately 80,000,000 kilograms. The value of the gold produced with the silver from mines in the United States had amounted to more than \$2,000,000,000 up to the end of 1920. The production of silver in the United States, classified, is shown in the following table.

REFINERY PRODUCTION OF SILVER  
IN THE UNITED STATES, 1921

STATE OR TERRITORY	Silver Ounces and value *
Alaska . . . . .	775,885
Alabama . . . . .	4
Arizona . . . . .	2,864,962
California . . . . .	3,460,219
Colorado . . . . .	5,408,273
Georgia . . . . .	3

\* Average price per ounce, 1.000 fine, of bar silver in New York.

It is not possible to forecast the silver production of the world with any degree of accuracy, as it responds so closely to financial and world economic conditions regulating its price, and to the activity of mining operations where it is obtained as a by-product. It is true that for several periods the price of silver has gone below 50 cents per ounce, a point that has

been considered about the profitable limit for many mines, but on the other hand there have been long periods through which the price has remained consistently above that point. In December of 1920 it attained an average value of 131,976 cents an ounce in New York to which point it had reached after being 53,796 in January, 1911. During the World War and afterwards silver appreciated in value and much was shipped from the United States to the Orient, and in its place under the terms of the Pitman Act silver was purchased by the American Treasury Department at 100 cents an ounce. For the production of silver and its use as money, see MONEY; PRECIOUS METALS.

**Metallurgy.** The variety of processes for the extraction of silver from its ores is so great that only a general review of the most important is possible here. In all cases the silver is at last obtained in union with lead, zinc, copper, or mercury, or in solution, from which it can be precipitated as metal or sulphide or chloride, or else it is separated by electrolysis from its combinations. The methods of extraction thus fall into three main groups—designated as dry processes, combined dry and wet processes, and electrolytic processes. Essentially the metallurgy of silver may be broadly classed under the two heads of fire metallurgy and wet metallurgy.

**Dry Process, or Fire Metallurgy.** The extraction of silver under this method is effected by converting the metal into a silver-lead alloy which is cupelled in a furnace, or by forming a silver-copper alloy in copper smelting, from which the silver is finally extracted by dissolution and electrolytic deposition. The production of the silver-lead alloy depends upon the power which molten lead possesses of dissolving silver from its ores or compounds. The lead readily alloys with the silver, and the process is carried out either by simple melting or by a combination of roasting and melting. The silver-lead alloy is called work lead. When the silver in the lead is not in great enough quantity to make direct cupellation profitable, an intermediate process of concentration is carried out. Different processes are required to produce work lead from ores and from matte, speiss, alloys, and other intermediate products.

The variations of the fire process are all modifications of two general systems—one in which the ore is introduced into a bath of molten lead in a reverberatory furnace, and the other the reduction of the ore, or other product, with materials rich in lead in a blast furnace. The processes are known as reverberatory and blast-furnace processes. The former is used to some extent abroad, but in the United States the blast-furnace system is almost universally followed. If the silver content of the work lead is less than about 0.12 per cent, the lead is preferably treated either by the Pattinson process or by zinc desilverization. In the Pattinson process the work lead, by slow cooling from the molten state, is separated into crystals poor in silver and a molten portion rich in silver. If the richer portion is separated it can again be divided into a poorer solid part and a richer liquid alloy. This operation can be repeated until the enriched lead contains 2.5 per cent of silver. The Pattinson process is conducted in pots of cast steel or cast iron. The crystals are separated from the mother liquor either

by ladling them out of the pot or else by tapping off the mother liquor and leaving the crystals behind. The formation and separation of the crystals are effected either by stirring the cooling mass or by blowing steam through it.

In zinc desilverization the silver is separated from the work lead in the form of a zinc-silver-lead alloy, the lead poor in silver remaining behind. The process is based upon the fact that, if argentiferous lead be melted, pieces of zinc forming altogether from  $1\frac{1}{2}$  to 2 per cent of the weight of the lead thrown upon the surface, the temperature of the bath raised to the melting point of the zinc, and the whole thoroughly stirred by mechanical devices or by the passage of dry steam and allowed to cool, a crust or scum forms upon the surface as the temperature is lowered, and this scum is a mixture of solidified lead alloys, zinc, and silver. The scum is lighter than the molten lead and, containing all the silver originally present in the lead, it can easily be separated from the rest of the metal forming the bath. After separation the excess of lead present is removed by liquation (see LIQUATION), a process based upon the fact that the alloy has a higher melting point than the lead itself. The scum is placed in pots or reverberatory furnaces and heated until the excess of lead melts and separates from the solid alloy. The latter, or rich scum, is next heated for the separation of zinc by the process of distillation, or oxidation, or treatment with fluxes, so that only the silver and lead remain. The cupeling process consists of an oxidizing melting of the lead in a reverberatory or cupel furnace. It may be performed in stages or continuously. The work lead is charged into the furnace with a quantity of litharge, and the mass is slowly melted by increasing heat. Successive scums are formed on the molten surface; these scums containing litharge mixed with other oxides of lead, together with impurities, are scraped off from time to time. The remaining product is silver containing about 10 per cent of impurities. This is then again refined, more litharge being added and the melting and skimming process repeated.

The dry or fire process is responsible for the greater part of the silver produced, but the wet processes are important in metallurgy, since they account for a production of the metal from ores too poor to be treated by the fire process. Wet metallurgy of silver is cheaper and simpler than the fire process and is among the most highly developed of metallurgical systems.

Argentiferous copper ores (see COPPER, METALLURGY) are treated in such manner that silver and gold, if the latter is present, follow the copper into the matte and crude metal. The usual practice in the United States is to separate the precious metal from copper by electrolytic refining. Crude copper is partially refined in reverberatory furnaces, thus removing the greater part of the base metal and impurities. From this furnace molten metal is cast into the form of anode plates, and these are suspended in multiple with cathode sheets of thin pure copper in a tank containing an electrolyte of copper sulphate and sulphuric acid. On passing a current of electricity, the copper is dissolved from the anode and deposited on the cathode in a pure state, leaving the base metal impurities and the precious metals in the form of a sludge, or mud, which is sub-

sequently treated by fire and reduced to metal bars. A further separation may be made if gold is present. The gold-silver separation is made before melting the sludge into bars.

**Wet Processes.** The amalgamation of silver, one of the earliest of the wet processes, is performed by grinding the ore and mixing it with mercury, either in the presence of chemical reagents or without them. The grinding is done in water, and during the process the silver unites with the mercury, forming an amalgam that is afterward distilled, the mercury being driven off as a vapor and the silver left behind in a spongy form, which is afterward melted into bars. Amalgamation with mercury alone is comparatively rare in the metallurgy of silver and can be applied only to those ores in which the silver occurs in a free metallic state. It is said to have been formerly used extensively in Peru, Chile, and Mexico and may yet be used to some extent in countries where ores of the requisite kind are to be found.

Amalgamation with the use of chemical reagents is employed where silver exists in the combined form, either with sulphur, arsenic, antimony, or combinations of two or more of them. Within the scope of this classification come the processes known as the Cazo, Kröhnke, Patio, and Washoe processes. Of these the first two have never become popular nor widely used, but both the Patio and Washoe processes, almost identical in chemistry but differing in mechanical application, have had an extremely wide application. The Patio process is of great antiquity and is said to have been first applied by one of the Spanish operators at Pachuca, Mexico, in the early part of the sixteenth century. Its name is derived from the Spanish word for a paved court, or floor, which is known as a patio. The process was extensively used in Mexico and the Central and South American countries. In its application the ore is first ground in edge runners, or Chilean mills. (See GRINDING, CRUSHING, AND PULVERIZING MACHINERY.) Then fine grinding is done in an arrastra. This machine consists of a circular depression in the ground having its sides and bottom lined with hard stone. In the centre of the pit floor is a pyramidal stone with a hole in the top, on which pivots a vertical post, supported at its upper end by a horizontal beam. This post carries two or four horizontal arms, to each of which is fixed, through chains or thongs, one or more blocks of hard rock. The blocks are so arranged that when grinding the front end is slightly lifted from the floor, the rear end dragging. By revolving the vertical shaft these blocks are dragged around in the pit, grinding the ore, which is deposited on the floor. The movement of the machine was originally provided by animals, but later applications used steam or water power. The ore is ground with sufficient water so that when it is removed from the arrastra it is in the form of a thin mud. This mud is then placed upon the amalgamation floor, or patio, in small heaps, or tortas. The patio is simply a spacious yard paved with flagstones or cement, preference given to material as impervious as possible to mercury. When first formed the tortas are about the consistency of thick mud. They are given a sprinkled layer of salt and turned with a shovel, after which a troop of horses or mules is driven around in the torta for a number of hours each day. Turning by shovels follows

the treading process, and then another period of treading follows. After a sufficient number of repetitions of these alternate processes sulphate of copper in one form or another is sprinkled over the torta and mixed by a similar procedure of shoveling and treading. Mercury is then added in a finely divided state and is in turn mixed in by turning and treading. Altogether this treatment of the torta lasts from three to six weeks and is considered complete when 75 per cent of the silver content has been amalgamated. The amalgam is separated from the other materials by agitating the torta slowly in tanks with water. The heavy amalgam settles to the bottom, while the water is agitated enough to carry off the lighter ore. The amalgam is collected and pressed into bags, molds, or bottles and is then ready for distillation. The Patio process is now seldom or never used, having been superseded in the last 10 years first by the Washoe process and then by cyaniding.

The Washoe process of amalgamation is the one developed and most frequently used in the United States to take the place of the Patio process. It was widely used before being replaced by still more economical forms of metallurgy. Its chemistry is identical with that of the Patio process. The ore is crushed in breakers, stamp mills and regrinding machines forming a finely ground pulp, just as in the Patio process. The pulp is then passed to pans with either wood or iron sides, but having cast-iron bottoms. They are from 2 to 2½ feet deep and from 4 to 5½ feet in diameter. A central revolving apparatus, equipped with grinding shoes, bears down upon the cast-iron bottom and performs a grinding service. When the ore, together with mercury and the necessary chemicals, is introduced into the pan, a period of grinding and amalgamation follows. This is analogous to the shoveling and treading of the tortas in the Patio process. By means of mechanical energy and steam heat, however, the time required for the fruition of the process is much reduced. When amalgamation has been completed the contents of the pan are emptied into a settler, in which the pulp is diluted with water and gentle agitation provided, allowing the amalgam to settle to the bottom while the ore pulp is washed away. This is the same as the washing process used in the Patio system. A later development of the Washoe process is known as the Boss process, or continuous system, identical theoretically with the systems described, but performed through a series of pans operated continuously, thus avoiding the necessity for stopping and emptying each pan. It is simply a mechanical improvement upon the Washoe process.

When the ore is so complicated as to require roasting, that process is applied for the purpose of removing volatile interfering elements such as sulphur, arsenic, antimony, etc. After being roasted the ore may be treated either by the Patio or Washoe process.

Distillation is the final operation through which the silver-mercury alloy, or amalgam, is separated. Cast-iron retorts are usually employed, the mercury vapor being cooled in a condenser.

Another class of wet processes is that in which the silver is dissolved in aqueous solutions and later recovered from them by precipitation. The silver is first converted into a compound soluble

in water or certain aqueous solutions, and suitable reagents used to precipitate it. The soluble silver compound may be the chloride, the sulphate, or the cyanide, i.e., the double cyanide of silver and an alkaline element. There are several processes by which silver is obtained as chloride. The Augustin process uses brine as a solvent and metallic copper as a precipitant. The Patera process uses sodium thiosulphate, and the Kiss process calcium thiosulphate as solvent. In the Russell process the silver as metal or metal sulphide is brought into solution by sodium-copper thiosulphate, and in the Ziervogel process the silver is converted into sulphate and dissolved in hot water. In the cyanide process the ore is treated with a solution of an alkaline cyanide, forming a double cyanide of the silver and alkaline metal. Precipitation from the solution is by means of zinc, aluminium, or electrolysis. The Augustin, Patera, Ziervogel, and Kiss processes are rarely practiced now. In the Russell process the silver present as metal or sulphide is dissolved by a solution of sodium-copper thiosulphate and precipitated by sodium sulphide. The Ziervogel process is used in treating copper ores containing silver. By careful roasting the silver in such ores is converted into sulphate, and this is dissolved by treating the roasted ore with hot water. The silver is precipitated by metallic copper. The Russell process is still in use in some cases, especially in treating accumulated tailings contaminated with organic matter and thus not amenable to cyanidation.

**Electrolytic Processes.** The electrolytic process has been used to separate the silver from the lead-silver produced at smelting works from argentiferous lead ores. The silver alloy is remelted and cast into plates as anodes, with plates of pure lead as cathodes. The electrolyte is a solution of lead fluosilicate. The separation of silver from the gold-silver alloy obtained in cupeling rich silver lead is successfully accomplished by electrolysis. The alloy is cast into anode bars and suspended with cathodes of pure silver in an acid electrolyte of silver nitrate, where the silver is deposited upon the cathode, leaving the gold in the form of a residual sludge. The cathode silver is melted in a small cupel furnace and refined until the quantity of impurities present has been reduced to 0.001 or 0.002 per cent.

**Cyanide Process.** From 1906 to 1916 the application of the cyanide process in silver recovery was so complete that it practically replaced all other wet systems. This process depends upon the solubility of the silver double cyanide in aqueous solutions. The cyanide systems now in use may be divided into three general classes. The first of these makes use only of percolation, in the practice of which the ore is ground so as to make a minimum of very fine or colloidal matter, as much as possible of the ore being put into finely granular form. This is put into a tank equipped with a filter bottom, and the cyanide solution allowed to percolate through it. In its passage the silver is dissolved.

Under the second system part of the ore is treated by percolation and part by agitation. The latter is applied to only the very finely divided ore that can be kept in suspension by economical mechanical means. The finely divided portion, known technically as slime, is separated by a classifying machine from the sand and is put into agitating tanks. The rea-

son for agitation is that slimes consist largely of colloidal matter which cannot be percolated, since it will not permit the passage of solutions through its impervious bed. Should this material be discarded, as was done in the early days of the process, it would entail a large loss, since the slime usually carries much silver. In the third method all of the ore is treated as slime by first grinding it to a state of extreme subdivision. This is usually referred to as the total-slime method. After the dissolution of the silver has been carried to the desired point the solutions are separated from the slimes by filtration or by settling and decantation.

The solutions from both sand and slime are carried to the precipitation department, where they are run through boxes containing zinc shavings, the result being the precipitation of silver and gold upon the zinc. The latter is consumed during the operation, the precious sludge settling to the bottom of the box, whence it is gathered, dried, fluxed, and melted in a crucible, usually of graphite. The resulting bars are usually shipped to a refinery for the final treatment. It has been found in some cases that aluminium becomes a more satisfactory precipitating agent than zinc, since it forms no cyanide compounds and results in less consumption of that material. Electrolysis has also been largely used for precipitation, iron anodes and sheet-lead cathodes being used. The silver is deposited upon the lead as a plating, the recovery being by cupellation. A modification of the electrolytic process is one in which the current density is so increased that the silver is deposited as a sludge instead of a plating, the sludge settling and being recovered as with zinc. Both zinc and aluminium are used at the present time in the form of dust or fume, since the finely divided form offers more surface to the action of solutions and is more efficient.

The flotation process is simply a modification of concentration, in which oiled sulphides are floated by attaching to them bubbles of air, a froth being formed on the surface of the mixture containing the valuable sulphides. A skimming process recovers the froth and sulphides.

**SILVER, MEDICAL USES OF.** Metallic silver is not used as a therapeutic agent, but is employed in surgery in the form of wire for suturing wounds and uniting bone fragments. The silver salts of the materia medica are the nitrate, the oxide, and the iodide. Silver nitrate has already been partly considered under the title LUNAR CAUSTIC. Externally the silver

preparations are astringent, stimulating, and hemostatic; in concentrated solution, caustic. Of late years a number of compounds of silver and albumen or nuclein have been made, with the object of eliminating the irritant properties of silver nitrate while preserving its alterative and tonic qualities. Argylol and protargol are representatives of this class and are largely replacing the nitrate. These are useful in catarrhal conditions or specific inflammations of the mucous membrane of the eye, nose, throat, middle ear, urethra, and vagina and are employed as topical applications in conjunctivitis, chronic pharyngitis, or laryngitis, in gleet (chronic urethritis), and inflammation of the vagina or cervix uteri. Internally silver salts, principally the nitrate, are useful in gastric ulcer, in combination with hyoscyamus, as a pill. Silver nitrate is a remedy of value in idiopathic or nonsyphilitic spinal sclerosis, but it is often ineffectual. When the silver salts are given for any length of time, they are deposited in the tissues, giving rise to a peculiar pale slate-blue color of the skin. Argyria, as this condition is called, is not very amenable to treatment, but potassium iodide may help to eliminate the substance from the tissues.

**SILVER AGE.** See GOLDEN AGE; LATIN LITERATURE.

**SILVER-BELL TREE.** See SNOWDROP TREE.

**SILVER CITY.** A city and the county seat of Grant Co., N. Mex., 175 miles northwest of El Paso, on the Atchison, Topeka, and Santa Fe Railroad (Map: New Mexico, A 6). It is the trade centre for a large mining and stock region. Gold, silver, copper, zinc, and lead are mined, and there are highly productive turquoise mines. The New Mexico Normal School is situated here. Silver City is known chiefly as a health resort for tuberculosis patients, there being here three large sanatoriums, besides the Fort Bayard government sanatorium for soldiers and sailors, 9 miles to the northwest. In the neighborhood are the interesting cliff dwellings of the Gila River. Pop., 1900, 2735; 1910, 3217.

**SILVER CREEK.** A town in Chautauqua Co., N. Y., on Lake Erie, at the mouth of Silver Creek, 9 miles east-northeast of Dunkirk, and on the Lake Shore and Michigan Southern and the New York, Chicago, and St. Louis railroads (Map: New York, A 5). It has extensive grain-cleansing-machinery plants, and manufactories of chairs, canning and other mill machinery, furniture, grape products, etc. Pop., 1900, 1944; 1910, 2512.

**SILVER EYE.** See WHITE EYE.

**SILVERFIN'.** A minnow (*Notropis whipplei*), common in clear streams of the northern interior of the United States. It is 4 inches long and leaden silvery in color. See Plate of DACE AND MINNONS.

**SIL'VERFISH',** or FISH MOTTH. See BRISTLETAIL; CUTLASS FISH.

**SILVER FULMINE.** See EXPLOSIVES, *Fulminates and Amides*.

**SILVER GLANCE.** See ARGENTITE.

**SILVER GRAYS.** In United States political history the conservative wing of the Whig party. It is said to have derived its name from the long gray hair of Francis Granger (q.v.). See PARTY NAMES.

**SILVER LACE.** See GOLD LACE.

**SILVERMAN, JOSEPH** (1860- ). An American rabbi, born at Cincinnati, Ohio. He graduated from the University of Cincinnati in

1883, studied at the Hebrew Union College, and was ordained rabbi in 1884. After 1888 he was minister of Temple Emanu-El, New York. In 1900-03 he served as president of the Central Conference of American Rabbis. He was a member of Mohonk Peace Conferences in 1911-13 and vice president of the International Peace Forum and associate editor of the *Peace Forum Magazine* in 1913. Besides pamphlets on various subjects, Dr. Silverman published *Catechism on Judaism* (1886).

**SILVER PARTY.** See PARTY NAMES.

**SILVER PHEASANT, CHINESE.** See KALEEGE.

**SIL'VERSIDE',** or SAND SMELT. A slender fish of the family Atherinidae, which seldom exceeds 6 inches in length. The silversides go in large schools in the tropical and temperate shore waters. A few are found in fresh waters. All have a silver band along the side, whence their name. When large enough they are esteemed as food. See Plate of MULLET and ALLIES.

**SIL'VERSPOT'.** See FRITILLARY.

**SILVER SPRING.** The most noted spring in Florida and one of the largest in the world. It is in Marion County, at the eastern edge of the lime-sink region, about 6 miles east-northeast of Ocala. It fills an approximately circular basin about 200 feet wide and 30 feet deep. It contains about 275 parts per million of dissolved minerals, chiefly calcium carbonate, and its temperature is about 72° F. The water, which is extremely transparent, issues from several irregular orifices in the bottom of the basin at a rate varying from about 400 to 800 cubic feet a second at different seasons, or several hundred million gallons a day. The stream issuing from it, Silver Spring Run, 9 miles long, is a tributary of the Oklawaha River (q.v.) and is navigated right up to the spring by passenger steamers from Palatka. It has a railroad station right on its edge as well as several boathouses. Consult: John LeConte, in *American Journal of Science*, vol. lxxxii (New Haven, 1861); C. L. Norton, *Handbook of Florida* (3d ed., New York, 1892); United States Geological Survey, *Water Supply and Irrigation Papers*, Nos. 102, 242, 319 (Washington, 1904-14); Florida Geological Survey, *7th Annual Report* (Tallahassee, 1915).

**SIL'VERTIPS'.** See BEAR, *Grizzly Bear*.

**SILVER WEDDING.** See WEDDING ANNIVERSARIES.

**SILVER WEED.** See POTENTILLA.

**SILVES, sêl'vêsh.** A southern seaport of Portugal, on the Silves River (Map: Portugal, A 4). Cork cutting and the exporting of fruits and vegetables form its main industries. In the eleventh century Silves was the capital of the Moorish Kingdom of Algarve and was captured by the Christians two centuries later. Pop., 1900, 9688.

**SILVESTRE, sêl'vês'tr', PAUL-ARMAND** (1837-1901). A French novelist, poet, playwright, and critic, born in Paris. He studied at the Ecole Polytechnique, entered the government service, and was finally employed in the Bureau of Libraries and Archives. His first verses, *Rimes neuves et vieilles*, appeared in 1866 with a preface by George Sand. Other books of his poetry are: *Renaissances* (1870); *Gloire du souvenir* (1872); *Chanson des heures* (1878); *Ailes d'or* (1880); *Chemin des étoiles* (1885); *Roses d'octobre* (1889); *L'Or des couchants* (1899). Silvestre composed many Rabelaisian tales for the journal *Gil Blas*. His prose con-

sists mainly of the short stories which he turned out with facility, finished in style, but nearly always sensual in tone and subject. He also wrote *La Russie, impressions, portraits, paysages* (1891), and several dramas, comedies, and libretti.

**SILVESTRE DE SACY, BARON.** See SACY, A. 1., BARON SILVESTRE DE.

**SILVICULTURE.** See FORESTRY.

**SILVIUS.** See SYLVIVS.

**SIMANCAS, sê-mân'kâs** (Lat. *Septimania*). A town of the Province of Valladolid, in Old Castile, Spain, 8 miles southwest of Valladolid, on the right bank of the Pisuerga River. The town is situated in the midst of a plain devoted to culture of cereals, fruits, and the vine. Here an old Roman bridge spans the river and remains of ancient fortifications exist. In Simancas are collected the richest archives of Spain. The Moorish alcazar was selected as the repository by Charles V and this received the support of Philip II. These historical treasures are largely unexplored. Pop., 1900, 1129; 1910, 1112. In 934 Simancas was the scene of a bloody battle between the Christians and the Moors.

**SIMBIRSK, sêm-bêrsk'.** A government of east Russia (Map: Russia, G 4). Area, about 19,110 square miles. It rises to an elevation of over 1000 feet above the sea in the range which covers the eastern part along the Volga. The western part is low and intersected by rivers. Simbirsk belongs to the basin of the Volga, that river forming its eastern boundary. The climate is continental and severe; a large part of the surface is covered with forests. Agriculture, the leading occupation, is favored by a fertile soil, and extensive crops of rye and oats are exported. Linseed and hemp are also grown, and stock raising is important, the government being noted for its breed of horses. The forests furnish the material for house industries, whose chief products are wagons, sledges, and wooden vessels. Felt hats and boots, bags, and small metal wares are also produced in the villages. The annual output of the manufacturing industries (principally military cloth, flour, and spirits) exceeds \$5,000,000. Pop., 1912, 1,997,400.

**SIMBIRSK.** The capital of the Government of Simbirsk in Russia, on the right bank of the Volga, about 580 miles east-southeast of Moscow (Map: Russia, G 4). It has a pleasant appearance on account of its numerous gardens and elevated positions above the river. The principal products are spirits; a considerable trade in horses is carried on. The annual fair is still of some importance. The town was founded in 1648. Pop., 1911, 64,072.

**SIMCOE, sîm'kô.** A town and the county seat of Norfolk County, Ontario, Canada, on the Grand Trunk and the Wabash railways (Map: Ontario, E 8). It has a Carnegie library and owns its water works. Pop., 1901, 2627; 1911, 3227.

**SIMCOE, JOHN GRAVES** (1752-1806). An English soldier, the first Governor of Upper Canada. He was born at Cotterstock, Northamptonshire. After education at Eton and at Merton College, Oxford, he entered the army in 1771 and went to New England during the Revolutionary War, raising and commanding the Queen's Rangers, as lieutenant colonel. He was wounded at Brandywine and at Monmouth and surrendered with Cornwallis at Yorktown in 1781. He was Governor of Upper Canada (1791-94), Governor of Santo Domingo (1796-97), became

lieutenant general in 1798, and in 1806 received the appointment of commander in chief in India, but was taken ill, and, returning, died in England. He founded London (q.v.), Ontario; and Lake Simcoe, a county, and a town in Ontario were named in his honor. Consult D. C. Scott, *John Graves Simcoe* (Toronto, 1905).

**SIMCOE, sîm'kô, LAKE.** A lake of Ontario, Canada, 30 miles long and 18 miles wide, with an area of 160 square miles (Map: Ontario, F 5). It is about 130 feet above Lake Huron, into which it discharges through the Severn, Lake Couchiching, and Georgian Bay. In the winter its frozen surface forms a serviceable highway. Barrie and Orillia (q.v.) are its chief towns. There are also numerous pleasant summer resorts, with good boating and fishing. The vicinity was the scene of the great war between the Iroquois and Hurons, in which the latter were almost exterminated.

**SIMEON** (Heb. *Shim'on*; of uncertain derivation). A very common Hebrew name (also Nabataean), appearing generally in English as Simon (also Symeon); also the name of a Hebrew tribe and of its traditional ancestor, the second son of Jacob. Of the patriarch little is told; he took part with Levi in the raid upon Shechem (Gen. xxxiv), was hostage for his brothers to Joseph (chap. xliii), and is cursed along with Levi by the father in Jacob's blessing (chap. xlix). These traditions doubtless represent tribal conditions in early Hebrew history. Upon the conquest of Canaan Simeon appears as accompanying Judah in the conquest of southern Canaan (Judges xi). This seems to indicate that Simeon, whose territory appears to have been north of Levi's, with its centre at Kadesh Barnea (q.v.), was crowded out by Judah. From this time Simeon almost disappears from history, except for a probably reliable record by the Chronicler (1 Chron. iv. 24 et seq.) of an expansion of the tribe in King Hezekiah's time, even as far as the land of Seir. It does not figure at the division of the Kingdom, nor is there any reference to Simeon upon the return. (An old tradition reads Simeon for Shimei in Zech. xii. 13.) With this disappearance of the tribe goes the testimony of its nonmention in Moses' blessing (Deut. xxxiii). The legends of patriarchal times therefore stand for the historic fact that Simeon, a border tribe, early lost its identity, partly through war, partly through amalgamation with Judah or with desert tribes, with which history may be compared the fate of Dan. Consult: Graf, *Der Stamm Simeon* (Meissen, 1866); Steuernagel, *Einwanderung der israelitischen Stämme* (Berlin, 1901); Eduard Meyer, *Die Israeliten* (Halle, 1906).

**SIMEON, or SYMEON** (?-c.927). A Bulgarian ruler, son of the Boris who introduced Christianity, which was established firmly by Simeon. The latter created a Bulgarian archbishop independent of Constantinople. He was the first Prince of Bulgaria to take the style of Czar or Emperor of all the Greeks and Bulgarians, upon coming to the throne in 890. His greatest fame was as a warrior. He thrice laid siege to Constantinople and in 893 concluded a treaty by which the city became tributary to him, as Servia also was during most of his reign.

**SIMEON, CHARLES** (1759-1836). An eminent evangelical preacher of the English church. He was born at Reading in Berkshire, educated at Eton and at King's College, Cambridge, and was ordained a priest in 1783. He was appointed

vicar of Trinity Church, Cambridge, in the year of his ordination and held this office to the close of his life. As a preacher Simeon was distinguished for an impassioned evangelicalism that at first roused against him a bitter and protracted opposition. His earnestness, however, brought friends and followers, and in course of time Simeon became a centre of evangelical influence that spread itself over the whole church. He was one of the founders of the Church Missionary Society, and his influence was large in the growth of the Low Church movement. His entire works, including a homiletical commentary on the Bible, have been published (21 vols., London, 1840); also selections (2 vols., 1854). Consult: W. Carus, *Memoirs of the Life of Charles Simeon* (London, 1847); A. W. Brown, *Recollections of Simeon's Conversation Parties* (ib., 1862); H. C. G. Moule, *Charles Simeon* (ib., 1895).

**SIMEON (STYLITES)**, *sím'fē-ūn stī-lī'tēz*. See **PILLAR SAINT**.

**SIMFEROPOL**, *sēm'fē-rō'pōl-y'*. The capital of the Government of Taurida, South Russia, in the southwestern part of the Crimean peninsula, about 200 miles southeast of Odessa (Map: Russia, D 5). It has a separate quarter for the Tatar inhabitants and a number of mosques. Fruit preserving is the chief industry. There are some manufactures of flour and tobacco and an export trade in fruits and wine. Pop., 1911, 69,666, including 7000 Tatars. Simferopol occupies the site of the Tatar settlement of Ak Metchet (white mosque).

**SIMIIDÆ**. The family of simian or anthropoid apes. See **APE**.

**SIMILARITY** (from *similar*, from Lat. *similis*, similar, like; connected with *simul*, together, Gk. *ἅμα*, *hama*, together, Skt. *sama*, like,

*ἴσος*, for similarity, is due to Leibnitz and is derived from the letter *S*).

When two similar figures are so placed that lines through their corresponding points form a pencil, they are said to be in perspective, and

ANY LINE SEGMENTS.

the vertex of the pencil is called their centre of similitude. The above figures are placed in perspective, and in each case *O* is the centre of similitude. In similar figures, if the ratio, *r*, known as the ratio of similitude, is 1, the figures

FOUR SIMILAR TRIANGLES.

are evidently symmetric with respect to a centre. Hence central symmetry is a special case of similar figures in perspective. The term "centre of similitude" is due to Euler. (See **SYMMETRY**.) Some of the principal propositions of similarity

THREE SIMILAR TETRAHEDRA.

are: Two triangles are similar if they have two angles of one equal to two angles of the other respectively. Mutually equiangular triangles are similar. If two triangles have the sides of the

THREE SIMILAR QUADRILATERALS.

equal, same, and ultimately with Eng. *same*). In geometry, the theory of similar systems and similar figures. Two systems of points,  $A_1, B_1, C_1, \dots, A_2, B_2, C_2, \dots$  are said to be similar when they can be so placed that all lines,  $A_1A_2, B_1B_2, C_1C_2, \dots$  joining corresponding points form a

ANY CIRCLES.

pencil whose vertex, *O*, divides each line into segments having a constant ratio *r*.

In the figures  $OA_1:OA_2=OB_1:OB_2=\dots=r$ . Two figures are said to be similar when their systems of points are similar. The symbol

one respectively parallel or perpendicular to the sides of the other, they are similar. If two triangles have one angle of the one equal to one

angle of the other and the including sides proportional, the triangles are similar. If two triangles have their sides proportional, they are similar. If two polygons are mutually equiangular and have their corresponding sides proportional, they are similar. Areas of similar polygons are proportional to the squares of the corresponding sides. Volumes of similar solids are proportional to the cubes of their like dimensions.

**SIMILE**, sim'ī-lē. See RHETORIC, FIGURES OF. **SIMKHOVITCH**, sim-kō'vich, VLADIMIR GREGORIEVITCH (1874- ). An American social economist, born in Russia. He studied at St. Petersburg, Berlin, and Halle, where he received the degree of Ph.D in 1898. As an advanced scholar he studied the literature of scientific Socialism and social economics, bringing to the notice of American students the significance of the Communist Manifesto (1847) as embodying the entire system of Marxian Socialism. In Columbia University he was associate professor of economic history from 1904 to 1915 and thereafter professor of economics. He was active and deeply interested in social-service work, particularly at Greenwich House. He wrote, besides many articles on Russian life and government and on social reform, *Marxism versus Socialism* (1913).

His wife, MARY MELINDA KINGSBURY SIMKHOVITCH (1867- ), was born at Chestnut Hill, Mass., graduated from Boston University in 1890, and studied at Radcliffe College, at the University of Berlin, and at Columbia. She was married to Professor Simkhovitch in 1899. She served as head worker at the College Settlement, New York City, in 1898, at Friendly Aid House from 1898 to 1902, and at Greenwich House thereafter. She was adjunct professor of social economy at Barnard College in 1907-10, and associate in social economy at Teachers College (Columbia) in 1910-13, and lectured at the New York School of Philanthropy after 1912.

**SIM'LA**. The capital of a district of the Punjab, British India, on a ridge of the Himalaya, 1000 feet above the sea, 170 miles north of Delhi (Map: India, C 2). It may be termed the official health resort of India, being the residence of the Viceroy of India and his staff during the hot season and the permanent headquarters of many departments of the Government of India. There are numerous fine public buildings and a commodious town hall. In the surrounding district European fruits and vegetables are cultivated, and there is an active export trade in fruit. Pop., 1911, (winter) 14,205, (summer) 35,432.

**SIM'MEL**, GEORG (1858- ). A German sociologist and philosopher. He was born in Berlin and became professor in the university there. His first book was *Ueber sociale Differenzierung* (1890; 4th ed., 1910), a suggestive study of the formation of social classes and groups. In his *Einleitung in die Moralwissenschaft* (1892; 3d ed., 1911) he makes an elaborate criticism of popular ethical notions. He also published *Philosophie des Geldes* (1900); *Philosophie der Mode* (1905); *Schopenhauer und Nietzsche* (1906); *Die Religion* (1906; 2d ed., 1912); *Die Probleme der Geschichtsphilosophie* (3d ed., 1907); *Soziologie* (1908); *Hauptprobleme der Philosophie* (2d ed., 1911); *Goethe* (1912); *Vorlesungen über Kant* (3d ed., 1913).

**SIMMERN**, HEINRICH, BARON LANGWERTH VON. See LANGWERTH VON SIMMERN, HEINRICH.

**SIMMONS**, DUANE (1834-89). An American physician and scholar, born at Glens Falls, N. Y. In 1859 he went to Japan as a medical missionary, but soon afterward entered the service of the Japanese government. In 1862-63 he continued medical study in Berlin. In 1869 he established the Juzen Hospital, instructing voluntary classes of Japanese doctors, and showing how cholera should be treated with the methods of modern sanitary science. In 1881, his health failing, he returned to the United States; but in 1887, settling again in Japan, he made a systematic study of Japanese feudal institutions. His studies of the Japanese village community are of the highest scientific value, and those on land tenure and social institutions have been published by Wigmore, in the *Transactions of the Asiatic Society of Japan*, vol. xix (Yokohama, 1892).

**SIMMONS**, EDWARD EMERSON (1852- ). An American decorative painter. He was born in Concord, Mass., graduated at Harvard in 1874, and studied under Lefebvre and Boulanger. After further study in Brittany and Cornwall, about 1893, he took up his residence in New York and became one of the leading American decorative painters. His work, which is free and sure in execution, and possesses much charm of color, includes mural paintings in the Massachusetts State House and in the Appellate and Criminal Courts, New York; nine panels in the Congressional Library, Washington; four pendentives in the Minnesota State Capitol; decorations in the Waldorf Astoria Hotel, New York City, and in the Court House at Mercer, Pa. Simmons received a gold medal at the Buffalo Exposition (1901).

**SIMMONS**, FRANKLIN (1839-1913). An American sculptor. He was born in Webster, Me., and was self-taught in art. In 1865 he went to Washington, where he made portrait busts of Grant, Sherman, Sheridan, and other celebrated men. After 1868 he lived chiefly at Rome, and he was knighted by King Humbert in 1898. He executed about 100 portrait busts in marble, and 15 public monuments, including those to General Grant, William King, and Roger Williams in the Capitol; the Naval Monument (1898) and the effective bronze equestrian statue of General Logan—both in Washington; the Longfellow and Soldiers monuments at Portland, Me. His ideal statues include "Medusa," "Angel of the Resurrection" and "The Promised Land" (Metropolitan Museum, New York). His work is dignified, conscientious, and not without imagination, but lacks emotion and the personal accent.

**SIMMONS**, FURNIFOLD McLENDEL (1854- ). An American lawyer and statesman, born in Jones Co., N. C. He attended Wake Forest College and Trinity College (North Carolina), graduating from the latter in 1873. Admitted to the bar in 1875, he settled finally at Newbern as the partner of ex-Chief Justice Faircloth. In 1887-89 he was a Democratic member of Congress and in 1893-97 collector of internal revenue for North Carolina. As chairman of the State executive committee of his party (1892-1906) he was a controlling factor in the struggle for white supremacy and for the partial disfranchisement of the negro. He was elected United States Senator in 1900 and was reelected in 1906 and in 1912. Not an orator and rarely speaking in the Senate, Senator Simmons was a tireless worker in the committees and a master of the subjects to which he gave his attention.

He was chiefly interested in the improvement of inland waterways and harbors and in bringing about industrial prosperity. Regarded as a conservative and reactionary in politics, Simmons was frequently charged with being the head of a machine. During the administration of President Wilson, whom he supported, he was chairman of the powerful Finance Committee and was one of the framers and most prominent defenders of the Underwood-Simmons Tariff Act.

**SIMMONS COLLEGE.** An institution for the higher education of women, incorporated in Boston in 1899 and opened in 1902. It was established in accordance with the provision of the will of John Simmons, a Boston merchant who died in 1870, to afford women a college education together with such a course in art, science, and industry as would best enable them to earn a livelihood. In 1915-16 the students in the college numbered 1083 and the faculty 118. The courses of instruction comprise household economics, secretarial studies, library studies, general science, philanthropic work, industrial teaching, salesmanship, and the special preparation for student and public-health nurses. The college offers a complete course of four years, short technical courses for students having adequate preliminary training, and partial courses. Graduation from an approved high school is a prerequisite for admission. The college graduate may ordinarily complete the technical work in one or two years. The college buildings are the main instruction building erected in 1904 on the Fenway, the School for Social Workers on Somerset Street, and eight dormitories. The value of the college property in 1915 was \$3,097,454, of which \$2,192,139 is a permanent endowment fund. The library contains about 22,000 volumes. The president in 1914 was H. Lefavour, Ph.D., LL.D.

**SIMMONS COLLEGE.** A coeducational institution for higher education, founded at Abilene, Tex., in 1891. It is under Baptist control. The college confines its courses to those leading to the degree of A.B., and it has become its pronounced policy to advance and expand along the line of vocational education. It includes industrial arts and sciences, manual arts and sciences, agriculture and stock raising. The total enrollment of students in 1914-15 was 512, and the instructors numbered 26. The college has an endowment of about \$100,000, the value of the grounds and buildings is about \$200,000, and the annual income is about \$40,000. The president in 1915 was Jefferson D. Sandefer.

**SIMMS, WILLIAM GILMORE** (1806-70). An American novelist, born April 17, 1806, at Charleston, S. C. He was admitted to the bar in 1827 and in the same year published *Lyrical and Other Poems*. In 1828 he became editor of the Charleston *City Gazette*, the Union proclivities of which lost him money and almost brought him physical ill treatment during the Nullification excitement. Having left Charleston temporarily in 1832, Simms resided for some months at Hingham, Mass. But the year 1833 saw him enter upon his true vocation. His *Martin Faber*, although in some respects a crude sensational novel, had genuine narrative power. In 1834 he published *Guy Rivers*, a tale of the gold fever in Georgia, the first of a series of border romances, including *Richard Hurd* (1838), *Border Beagles* (1840), *Beauchampe* (1842), etc., full of the crime and excitement that filled the South in those years and valuable as pictures of local

conditions. *Guy Rivers* was followed, however, by a story which showed Simms more profitable lines along which to walk as a disciple of Cooper. This was his *Yemassee* (1835), a tale of Indian warfare in Colonial Carolina. This is by many regarded as his best work, though perhaps equaled by some of the Revolutionary romances which began the same year with *The Parisian* and were continued with *Mellichampe* (1836); *The Kinsmen* (1841), afterward (1854) published as *The Scout*; *Katherine Walton* (1851); *Woodcraft* (1854); *The Forayers* (1855); *Eutaw* (1856). These romances dealing with the partisan warfare of Marion and other trackers of the Carolina swamps, in a manner almost worthy of Cooper, display a fund of historical knowledge, of vigorous description, and of narrative interest. Simms was the most representative man of letters save Poe produced by the South before the Civil War. His best short stories were collected in two volumes entitled *The Wigwam and the Cabin* (1845-46). He compiled a history of his native State and several historical monographs and wrote biographies of the Chevalier Bayard, Capt. John Smith, General Marion, and Gen. Nathanael Greene. Of the *Southern Quarterly Review* he was for a time editor, and he made a collection of the war poetry of the South. Supporting the Secession movement heartily, he lost heavily during the war. At its close he set to work to repair his fortunes by his pen, but with little success. Simms died at Charleston, June 11, 1870. Consult W. P. Trent, *William Gilmore Simms*, in the "American Men of Letters Series" (Boston, 1892), and O. Wegelin, *List of the Separate Writings of W. G. Simms* (New York, 1906). A bibliography by A. S. Sally, Jr., is one of the publications of the Southern Historical Association.

**SIM'NEL, LAMBERT** (fl. 1477-1525). An English impostor, probably born at Oxford. With the connivance of Yorkist leaders he was taken to Ireland in 1487 by one Richard Simon, a priest, and passed off as the young Earl of Warwick, who, some reports said, had died in the Tower of London. Officially recognized by Irish dignitaries, young Simnel was crowned as King Edward VI in Dublin despite the fact that the true Earl of Warwick had been exhibited in London. Later in 1487, to support his claims, a force of Irish and German levies under Sir Thomas Fitzgerald was landed in Lancashire, but they were defeated by the army of Henry VII (q.v.). Simon was thrown in prison, but the boy was pardoned and eventually became royal falconer.

**SIMOIS**, sim'ô-is. A stream of the ancient Troad, flowing into the Scamander (q.v.).

**SIMON, s'im'on, SIR JOHN** (1816-1904). An English hygienist. Born and educated in London, he practiced there and was connected with St. Thomas's Hospital. As medical officer of health to the city of London (from 1848) and to the government, he did much for the sanitary condition of the capital. In 1878 he became president of the Royal College of Surgeons, and in 1887 he was knighted. Among his writings are: *General Pathology* (1852); *Reports Relating to the Sanitary Condition of the City of London* (1854); *Report on the Last Two Cholera-Epidemics of London, as Affected by the Consumption of Impure Water* (1856); *Filth Diseases and their Prevention* (1876); *Public Health Report* (1887), a very important work; *English Sanitary Institutions* (1890).

**SIMON, SIR JOHN ALLSEBROOK** (1873- ). An English lawyer and cabinet minister. He was educated at Fettes College, Edinburgh, and Wadham College, Oxford. Called to the bar in 1899, he practiced his profession with much success and was made king's counsel in 1908. He was one of the counsel for the British government in the Alaska Boundary Arbitration in 1903. Entering politics as a Liberal, Simon was elected member of the House of Commons for Walthamstow Division, Essex County, in 1906. He was chairman of the Departmental Committee on Street Trading (1909), and a member of the Royal Commission on Justices of the Peace (1910). In the latter year he was knighted and was made Solicitor-General in the Liberal cabinet of Premier Asquith; in 1913 he became Attorney-General, with a seat in the cabinet; and in 1915 he was appointed Home Secretary in Asquith's coalition ministry, but he resigned early the next year because of his scruples against compulsory military service. Consult A. G. Gardiner, *Pillars of Society* (London, 1913).

**SIMON, JOHN SMITH** (1843- ). A British Wesleyan Methodist clergyman, born at Glasgow, Scotland. He was educated at Elizabeth College, Guernsey, and Victoria College, Jersey, and entered the ministry in 1863. He was elected to the Legal Hundred in 1895, was president of the Wesleyan Conference in 1907, and was a member of other important conferences. He published: *Methodism in Dorset* (1870); *A Manual of Instruction for Class Leaders* (1892); *A Summary of Methodist Law and Discipline* (1897; new ed., 1907); *The Revival of Religion in England in the Eighteenth Century*, the Fernley lecture for 1907.

**SIMON, sé'môn', JULES** (JULES FRANÇOIS SIMON SUISSE) (1814-96). A French statesman and philosopher, born at Lorient and educated at Lorient and Vannes. He occupied positions in the lyceums at Rennes, Caen, and Versailles and in 1839 through the influence of Victor Cousin became a professor of the history of philosophy at the Sorbonne. The popularity of his lectures and the publication of two notable works, *Etudes sur la théodicée de Platon et d'Aristote* (1840) and *Histoire de l'école d'Alexandrie* (2 vols., 1844-45), led after the revolution of 1848 to his election to the Constituent Assembly as a Conservative Republican. Within a year he became a member of the Council of State. He soon resigned his seat in the Assembly, and after the coup d'état of December, 1851, his refusal to take the oath of allegiance to Napoleon's government resulted in his losing his chair in the Sorbonne also. In the period of retirement which followed, lasting for more than a decade, Simon lived quietly at Nantes and wrote: *Le devoir* (1854); *La religion naturelle* (1856); *La liberté de conscience* (1857); *La liberté politique* (1859); *La liberté civile* (1859); *L'Ouvrière* (1861). Entering the Corps Législatif in 1863, he remained until the fall of Napoleon one of the leaders of the Republican opposition. He strongly opposed the war with Germany, and after the fall of the Empire he became one of the Committee of National Defense. In February, 1871, he became Minister of Public Instruction in Thiers's cabinet, retaining his office until May, 1873. On leaving the cabinet he resumed his position as leader of the Republican Left in the National Assembly until in 1875 he was elected a life Senator. In the same year he was elected to the French Academy. In December, 1876, he

was called upon by President MacMahon to form a cabinet in which he himself was Premier and Minister of the Interior. In May following, however, Simon resigned. In addition to the works already mentioned, his works include: *L'Ecole* (1864); *Le travail* (1866); *La peine de mort* (1869); *Le gouvernement de Thiers* (1871); *Victor Cousin* (1887); *La femme des XX<sup>ème</sup> siècle* (1891); *Le soir de ma journée* (1901).

**SIMON, RICHARD** (1338-1712). A French theologian. He was born at Dieppe, studied at Dieppe, Rouen, and Paris, and entered the Congregation of the Oratory in 1662. His early publications involved him in controversy with the Jansenists and Benedictines of Saint-Maur and made the great Arnauld (see ARNAULD, ANTOINE) his enemy. In 1678 Simon published the *Histoire critique du Vieux Testament*. At the instigation of Bossuet the greater part of the edition was burned. The book is a critical history of the text, translations, and expounders of the Old Testament and anticipates many of the conclusions and methods of modern scholars, particularly regarding the authorship of the Pentateuch. Simon published also: *Histoire critique du texte du Nouveau Testament* (1689; Eng. trans., 1689); *Histoire critique des versions du Nouveau Testament* (1690); *Histoire critique des principaux commentateurs du Nouveau Testament* (1693; Eng. trans., 1692), which called forth Bossuet's *Défense de la tradition et des saints pères*; and a French translation of the New Testament (1702). Consult: Bernus, *Richard Simon et son histoire critique du Vieux Testament* (Lausanne, 1869); id., *Notice bibliographique sur R. Simon* (Basel, 1882); T. K. Cheyne, *Founders of Old Testament Criticism* (New York, 1893); Archibald Duff, *History of Old Testament Criticism* (ib., 1910).

**SIMON BAR COCHBA**, or KOZEBA. See MESSIAH.

**SIMONDS, sí'mondz, FRANK H(ERBERT)** (1878- ). An American newspaper editor. He was born at Concord, Mass., and graduated from Harvard in 1900. During the Spanish-American War he served in Porto Rico, in 1901 he was resident at the University Settlement, New York City, and then entered journalism. He served as Albany (N. Y.) correspondent for the *New York Tribune* in 1903-05 and for the *New York Evening Post* in 1903-08. Joining the editorial staff of the *New York Sun* in the latter year, he wrote on local and foreign politics, particularly on the Moroccan crisis and the Balkan War, until 1913, when he became editor of the *New York Evening Sun*. Early in 1915 he took charge of the editorial page of the *New York Tribune*, as associate editor, and for it did much notable writing. He also contributed monthly special articles on the European War to the *American Review of Reviews*. He published *The Great War—The First Phase* (1914) and *The Great War—The Second Phase* (1915).

**SIMONE, sé'môn', MADAME** (?- ). The stage name of a French emotional actress. In private life she was Madame Simone Le Bargy for a time, but was divorced and in 1909 married Claude Casimir-Périer, son of the sometime President of France. She made her first appearance in Brussels, and her Paris début occurred in 1902. She achieved her greatest successes in the plays of Henry Bernstein (q.v.), *The Thief*, *Samson*, etc. In Rostand's *Chantecler* she created the rôle of the pheasant. During

visit to the United States in 1911-12 Madame Simone played in English.

**SIMONIDES**, sî-môn'î-dêz (Lat., from Gk. Σιμωνίδης) (556-468 B.C.). A Greek lyric poet, born on the island of Ceos. He was a finished literary craftsman in many forms of verse rather than a sublime or original poet. His life almost bridged the century from Pisistratus to Pericles, and in his multifarious activities he represents the transition from the earlier parochial isolation of the Greek cantons to the cosmopolitan culture of the Sophistic enlightenment. His poetic career began with the guidance of Apolline choruses in Ceos. Thence he was called to the court of Hipparchus at Athens, where he met Anacreon and competed with Lasus of Hermione, the teacher of Pindar. After the assassination of Hipparchus he attached himself to the ruling families of Thessaly, the Scopadæ and the Alcuadæ. His dirge in memory of Antiochus of Larissa was greatly admired. He displayed his detachment of mind by composing an epigram for the statue of Harmodius in which the assassination of Hipparchus is greeted as "a great light rising upon Athens."

Returning to Athens, now a democracy, he bore away the prize from Æschylus with an elegy on the warriors who fell at Marathon. Two epigrams dating from 476 B.C. inform us that he won the prize for the dithyramb in that year, and that no man could vie in powers of memory with Simonides at the age of 80. A year later we meet him in Sicily in the rôle of a mediator between Hiero and Theron. The remainder of his life was probably spent chiefly at the court of Hiero.

Simonides wrote for many clients in a great variety of forms—epigrams, hymns, pæans, skolia, epinikia, dithyrambs, hyporchemes (dance songs), threnoi (dirges). Though an Ionian, he used the modified Doric traditional in these forms of the Dorian choral lyric. To him, perhaps, after the initiative of Ibycus, may be attributed the full development of the encomian and epinician hymn in praise of living men.

His main opportunity came with the Persian wars. He understood as no one else did how to crystallize the sentiment of the national crisis into flawless gems of epigram, fitting memorials for the glorious dead of Thermopylæ, Salamis, and Platæa. The "tears of Simonides," the pathos of his dirges, were proverbial. The English reader may form some notion of that pathos from Milman's translation of the beautiful lament of Danaë exposed to the waves in a chest with her infant Perseus.

The vicissitudes of human destiny so amply exemplified in the century of history which he witnessed evoke from Simonides a noble but somewhat conventional strain of melancholy moralizing. For this "criticism of life" Matthew Arnold ranks him with Æschylus, Pindar, and Sophocles as a prophet of the "imaginative reason." His style is chaste, polished, and unobtrusively rhetorical rather than profoundly imaginative. The extant remains of his works are given in Bergk's *Poetæ Lyrici Græci* (Leipzig, 1843; 4th ed., 1882; reprinted, 1914). Consult E. Cesati, *Simonide di Ceo* (Casale, 1882); H. W. Smyth, *Greek Melic Poets* (London, 1900); A. and M. Croiset, *An Abridged History of Greek Literature* (Eng. trans., New York, 1904); W. Schröter, *De Simonidis Cei Melici Sermone* (Leipzig, 1906); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-

Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

**SIMONIDES** (or **SEMONIDES**) OF **AMORGOS**. A Greek poet who lived about 660 B.C. He ranked as second, both in time and reputation, of the three principal iambic poets of the early period of Greek literature, viz., Archilochus, Simonides, and Hipponax. He was born in Samos, whence he led a colony to the island of Amorgos. His writings are distinguished from those of his contemporary, Archilochus, by the fact that they attacked entire classes rather than single persons and contained more general reflections on the constant characteristics of human nature. Of the extant fragments of his writing the most important is *Περὶ Γυναικῶν*, *Peri Gynaikōn*, a satire on women, in which he gives a general description of female characters, deriving their various, though generally bad, qualities from the characteristic qualities of the animals from which he represented them to be descended. Consult Bergk, *Poetæ Lyrici Græci* (4th ed., Leipzig, 1882; reprinted, 1914); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

**SIMONIS**, sê-mô'nê, EUGÈNE (1810-82). A Belgian sculptor. He was born at Liège and studied at the academy there. He continued his studies in Rome under Matthias Kessels and Carlo Finelli. On his return he was appointed professor at the academy of Liège, but soon removed to Brussels, where he became director of the academy in 1863. Simonis is the most gifted Belgian sculptor of a period of "modified realism." His equestrian statue of Godfrey de Bouillon (1848, Place Royale, Brussels) is superior, in boldness, power, movement, and decorative qualities, to many other contemporary productions, but his work as a whole has no definite tendency. Among his other well-known sculptures in Brussels are the monument of Canon Triest (Cathedral), "Innocence" (Museum); the statue of Pepin of Heristal and the bas-reliefs for the Théâtre de la Monnaie (1854), the Northern Railway Station, and the Colonne du Congrès, for which he also modeled a statue of "Religious Freedom" and two "Lions."

**SIMON MACCABÆUS**, sî'mon mǎc'cā-bē'ūs. One of the five famous brothers who led the Jews in their war for independence against Syria, 167-142 B.C. (See **MACCABEES**.) Simon succeeded his brother Jonathan in 143 B.C. and soon gained the end that Jonathan had all but realized—the recognition of Jewish independence on the part of the Syrian government. The following year (141 B.C.) the "Congregation," or popular assembly of the Jews, elected Simon high priest and civil ruler (ethnarch), the formal title of the latter position being probably "head of the Congregation." Both offices were made hereditary in Simon's family. His reign of six years was very prosperous. Syria was too weak to regain control, and Simon's right to his position was approved by Rome. The union of the religious and civil headship in one person was not in strict accord with the law, although favored by the spirit of the priestly code. Scruples as to the status of the Maccabæan prince-priesthood were set at rest by the character and ability of Simon's administration. Ancient prophecies of the Messianic era and of a Messiah from Judah were viewed as finding their fulfillment in the priestly headship (of the tribe of Levi) over Judah. Simon was assassinated in 135 B.C. by a son-in-law, Pompey, Governor of Jericho

(I Macc. xiii-xvi). Consult Emil Schürer, *History of the Jewish People in the Times of Jesus Christ* (Eng. trans., Edinburgh, 1886-90; 4th Ger. ed., Leipzig, 1901-11); A. W. Strean, *The Age of the Maccabees* (London, 1898); R. H. Charles, *The Testament of the XII Patriarchs* (ib., 1908).

**SIMON MAGUS.** A religious pretender, first mentioned in Acts viii. 9 ff. and considered by the early Church historians as the originator of the various heresies which flourished during the first three centuries A.D.

**Account in Acts** (viii. 9-24). Here, while Simon appears mainly in the rôle of a magician or sorcerer, he is also represented as claiming to possess divinity. For his low-minded views of the Holy Spirit he was forcibly rebuked by Peter, possibly with good results. In Acts Simon is not viewed as a heretic or founder of a school of thought, although an earlier career of some note is implied by what is said in verses 9-11.

**Early Fathers.** Justin Martyr, writing about 150 A.D., says (*Apol.*, i, 26) that Simon was from the Samaritan village Gitton and practiced magic or sorcery. He was worshiped by nearly all the Samaritans as a god. He had with him a woman named Helen, formerly a Tyrian prostitute, whom he declared was an emanation (*ἐννοια*, thought) from himself. He practiced in Rome in the days of Claudius and with such success (aided by demons) that he was honored with a statue inscribed *Simoni Deo Sancto* (To Simon the holy God). Other heretics, such as Menander, were disciples of Simon, according to Justin. It is evident that Justin's account is quite independent of that in Acts and yet confirmatory of it in part, and, as Justin was himself of Samaritan origin, his testimony is weighty. (Cf. further *Apol.*, i, 56; ii, 15; *Dial.*, 120.) Hegesippus, another early Palestinian writer (c.170 A.D.), also mentions Simon as the father of numerous schools of heresy (Eusebius, *H. E.*, iv, 22). Later writers, such as Irenæus (c.180 A.D.) and Hippolytus (c.225), practically repeat Justin's account, but enlarge greatly on the details of Simon's heresy, which is represented as a quite fully developed form of Gnosticism. In Hippolytus we have the first notice of Simon as the opponent of Peter in Rome.

**Clementine Literature** (*Homilies, Recognitions*, and related *Acts*). In this extensive theological romance of the second and third centuries Peter, the exponent of Christianity, is represented as combating Simon, the sorcerer and teacher of error, mainly in towns in or near Palestine. In the *Acts* the contest ends in Rome, where Simon's attempt to fly is ignominiously defeated through Peter's prayers. Here and there in this literature Simon is made to champion Pauline views, and thereby an anti-Pauline propaganda was carried on, but this may not be an original feature of this literature. Consult: A. C. Headlam in Hastings, *Dictionary of the Bible* (New York, 1902); P. W. Schmiedel, in *Encyclopædia Biblica* (ib., 1903); H. Waitz, in *Realencyklopædia für Theologie und Kirche*, vol. xviii (Leipzig, 1906).

**SIMONOSEKI**, sēmō-nō-sā'kē. A town of Japan. See SHIMONOSEKI.

**SIMON PETER.** See PETER.

**SIMON PURE.** A Pennsylvania Quaker in Mrs. Centlivre's comedy *A Bold Stroke for a Wife*, who has a letter of introduction to the guardian of an heiress. This is taken by Colonel Feignwell, who impersonates the Quaker and

marries the girl. Simon afterward proves his identity; hence we have the phrase "the real Simon Pure."

**SIMONS, MENNO.** See MENNO SIMONS.

**SIMONSTOWN.** The capital of a district of Cape Colony, South Africa, on Simon's Bay, a western inlet of False Bay, 20 miles south by rail of Cape Town (Map: Cape of Good Hope, D 10). It is a naval station with fortifications of considerable strength; the docks, constructed between 1900 and 1910 at a cost of over \$12,000,000, cover an area of 35 acres or, including the tidal basin, 63 acres. The town is under the headland which forms the Cape of Good Hope. Pop., 1911, 7246.

**SIM'ONY** (ML. *simonia*, from *Simon* Magus, who attempted to buy the power of conferring the Holy Spirit). In English law, the giving or receiving of holy orders or ecclesiastical preferment for a valuable consideration, or an attempt or agreement to do so. It was condemned by the canon law from the earliest ages, as akin to heresy. Canon 40 of 1603 required every person appointed to ecclesiastical preferment to take oath that he had not obtained it simoniacally. In addition to penalties prescribed by the ecclesiastical law, the Statute of 31 Eliz., c. 6 (1589), imposed fines upon one guilty of the offense. The statute also provided that a simoniacal presentation should be void and that the corrupt presentee should thereafter be disqualified to hold the same benefice, however appointed. It is not now simony for either a layman or an ecclesiastic to purchase a right to an advowson (q.v.) or to make presentation to a benefice, provided he is not buying for himself and the church be full. This is true even if there is an immediate prospect of a vacancy, provided it will not be caused as a result of a contract or arrangement between the parties.

As there is no Established church in the United States, simony is not recognized as a civil offense and probably not as an ecclesiastical wrong. Consult: C. A. Cripps, *Law Relating to the Church and Clergy* (6th ed., London, 1886); Sir Walter Phillimore, *Law of the Church of England* (2d ed., ib., 1895); Sir William Blackstone, *Commentaries* (4th Am. ed., 2 vols., Chicago, 1899). See ADVOWSON; BENEFICE.

**SIMOOM**, sī-mōōm' (Ar. *samūm*, hot pestilential wind, from *samma*, to poison). A hot suffocating wind, carrying clouds of dust. These winds occur in greatest intensity in the deserts of northern Africa and western Asia, but similar winds are found in India, North America, and Australia. Simooms may be either local and like the hot winds, sand storms, and tornadoes, or more general, like the blizzards of North America. Owing to the clear sky over desert regions in the tropics, the soil and adjacent air may become intensely heated, causing local ascending currents and whirlwinds. Air temperatures of 120° F. and 140° F. have been observed in the Sahara and are not infrequent in Arizona, New Mexico, and Australia. Descriptions of the simoom indicate that, as it approaches the observer, its front extends at least from 5 to 20 miles, much like the advancing front of a series of thunder storms. The clouds of fine sand and dust that are carried up by the wind extend as a haze over the sky; the heavier sands are also transported in large quantities, and as they fall are collected in mounds around every obstacle like snowdrifts in winter. In the great storm of March 10-12, 1901, red and yellow sand and

dust from the Sahara fell in nearly every portion of Germany, France, Austria, and Turkey.

The simoom is not to be confounded with the khamsin, which usually blows for about 50 days from the northeast over Egypt. The sirocco (q.v.) is a hot moist southerly wind, in Sicily and Italy; the samiel is the similar hot southerly wind of Turkey; the solano is the hot south-east wind of Spain: these may all exist without any connection with the simoom, but on some occasions dry simoom winds have advanced northward from the desert and merged into the hot moist southerly winds, the sirocco, of the northern shores of the Mediterranean.

**SIMPLE HARMONIC MOTION.** See MECHANICS; WAVES.

**SIM'PLICIDENTA'TA.** See RODENTIA.

**SIM'PLICIS/SIMUS.** The first modern German novel—*Der abenteuerliche Simplicissimus Teutsch, das ist: Die Beschreibung des Lebens eines seltzamen Vaganten, genant Melchior Sternfels von Fuchshaim* (The Venturesome German Simplicissimus, that is: Description of the Life of a Remarkable Vagabond named Melchior Sternfels, of Fuchshaim) (1669). Its author was Hans Jakob Christoffel von Grimmelhausen (q.v.). The book treats of the Thirty Years' War in a most vivid and realistic way.

**SIMPLICIUS**, sim-plish'i-us. A Neoplatonic philosopher of the sixth century, who was a native of Cilicia. He was teaching at Athens when the schools of philosophy were closed by the edict of Justinian and was one of those philosophers who found a temporary asylum at the court of the Persian King Khosru I. Subsequently he lived at Alexandria. He was chiefly famous as a commentator on Aristotle. His complete works were edited by Schweighäuser (Leipzig, 1800). His commentaries on Aristotle's *Categories*, *Physics*, *De Cælo*, and *De Anima* were edited by Karsten (1865), and that on the *Enchiridion of Epictetus* by Enk (Vienna, 1866).

**SIMPLIFICATION.** See ETYMOLOGY, FIGURES OF.

**SIM'PLON**, Fr. pron. sän'plôn'. A famous Alpine mountain pass of Switzerland, 6592 feet above the sea, in the eastern part of the Canton of Valais, near the Piedmontese frontier (Map: Switzerland, C 2). The Simplon road, one of the greatest engineering achievements of modern times, leads over a shoulder of the mountain from Brig in Valais to Domodossola in the north of Piedmont. The road was commenced in 1800 under the direction of Napoleon and was completed in 1805. It is from 25 to 30 feet broad and 42 miles long. It is carried across 611 bridges, over numerous galleries cut out of the natural rock or built of solid masonry, and through great tunnels. The construction of a railway tunnel between Brig and Isella, begun in 1898, was completed in 1906. It has a length of about 12¼ miles and is the longest railway tunnel in the world. Its highest point is only about 2300 feet above sea level. Consult *La ferrovia del Sempione* (Rome, 1900).

**SIMPSON**, sim'son, EDWARD (1824-88). An American naval officer, born in New York City. He was appointed a midshipman in the navy in 1840, in 1845 entered the new Naval Academy at Annapolis, and in the following year graduated in the first class that ever went out from that institution. In the Mexican War he served on board the *Vixen* and took part in the bombardment of Vera Cruz. In 1855 he was commis-

sioned lieutenant and in the following year assisted in capturing the Barrier Forts near Canton, China. After some years as instructor at Annapolis he was in July, 1862, commissioned lieutenant commander, and in command of the monitor *Passaic* he participated in attacks on Fort Wagner, Fort Sumter, and Fort Moultrie. Later he was fleet captain of the blockading squadron before Mobile. He had risen to the rank of rear admiral when he was retired in 1886. His publications include: *Ordnance and Naval Gunnery* (1862); *Report on a Naval Mission to Europe* (2 vols., 1873); *Modern Ships of War* (1887).

**SIMPSON**, ELSPETH. See BUCHANITES.

**SIMPSON**, SIR GEORGE (1792-1860). A Canadian statesman and explorer, born in Ross-shire, Scotland. In 1820 he was sent to British America by the Earl of Selkirk, the leading spirit of the Hudson's Bay Company. In 1821, when the Hudson's Bay Company and its rival, the Northwest Company, coalesced, he was appointed governor of the northern department and subsequently general superintendent of the company's affairs in America, holding this position 35 years. In 1828 he crossed the continent to the Pacific and sent out several notable exploring expeditions. In 1841 Simpson was knighted, and in the same year he started on an "overland" journey around the world. He published an account of this as *A Narrative of a Journey round the World During the Years 1841 and 1842*. Consult A. Macdonald, *Peace River: A Canoe Voyage from Hudson's Bay to the Pacific by Sir George Simpson* (Ottawa, 1872), and J. C. Hopkins, *Canada: An Encyclopædia* (Toronto, 1898-1900).

**SIMPSON**, SIR JAMES YOUNG (1811-70). A Scottish obstetrician, born at Bathgate, Linlithgowshire. He was graduated in medicine in 1832 from the University of Edinburgh. He was elected president of the Royal Medical Society in 1835, lectured on pathology in the university, and in 1840 succeeded to the chair of midwifery. He became one of the physicians to the Queen in 1847. In 1846 he introduced ether as an anæsthetic into England, and in March, 1847, he first employed chloroform for the same purpose, being the pioneer in this method. In 1856 the Montyon prize of the French Académie des Sciences (2000 francs) was awarded to him in recognition of his services in the discovery of chloroform anæsthesia and its introduction into childbirth practice. Simpson invented acupressure in hemorrhage in 1859. In 1866 he was invested by Oxford with the degree of D.C.L. and was created Baronet the following year. Sir James was noted as an antiquary of eminence as well as a most skillful medical practitioner. His bust is in Westminster Abbey. His principal works are: *Essays on Anæsthesia* (1849); *Obstetric Memoirs* (1856); *Acupressure* (1864); *Selected Obstetrical Works* (1871); *Clinical Essays* (1871); *Clinical Lectures on the Diseases of Women* (1871). Consult the *Memoir* by Duns (1873).

**SIMPSON**, MATTHEW (1810-84). An American Methodist Episcopal bishop and educator, born at Cadiz, Ohio. He graduated at Allegheny College, Meadville, Pa., in 1832, and practiced medicine for a brief time, but entered the ministry in 1833. He became professor of natural sciences at Allegheny College in 1837, was president of Indiana Asbury (now De Pauw) University (1839-41), was editor of the *Western Chris-*

*tian Advocate* in 1848, was elected Bishop in 1852, and in 1859 accepted the presidency of Garrett Biblical Institute. He visited the Methodist missions in Syria and the East in 1863 and the Mexican missions in 1874 and was a delegate to the European Missionary Conferences in 1875. An intimate personal friend of President Lincoln, he was employed by the government in several important confidential commissions. He published: *A Hundred Years of Methodism* (1876); *Cyclopaedia of Methodism* (1878); *Yale Lectures on Preaching* (1879); *Sermons* (1885). Consult his *Biography* by G. R. Crooks (New York, 1890) and E. M. Wood, *The Peerless Orator* (Pittsburgh, 1908).

**SIMPSON, THOMAS** (1710-61). An English mathematician, born at Market Bosworth, Leicestershire. His interest in celestial phenomena seems to have been awakened by the solar eclipse of May 11, 1724. In 1735 he moved to London, devoting his spare time to the teaching of mathematics. In 1740 he was chosen a member of the Royal Academy of Stockholm and in 1745 a fellow of the Royal Society. In 1743 he was appointed professor of mathematics in the Royal Academy at Woolwich. In 1737 he published *A New Treatise on Fluxions*, which, although it contained some obscurities and defects, showed mathematical ability and gave him reputation.

**SIMPSON COLLEGE.** A coeducational institution for higher education, founded in 1867 at Indianola, Iowa. It is under the control of the Des Moines conference of the Methodist Episcopal church. The college includes departments of liberal arts, music, business, and an academy. The total value of the buildings and grounds in 1916 was \$271,000. The total enrollment in all departments in the autumn of 1915 was 616, and the faculty numbered 28. The permanent endowments of the college amounted, at the end of the fiscal year ending 1915, to \$261,340, and the income amounted to about \$47,000. In 1915-16 a campaign was carried on to raise \$400,000 for additional equipment and endowment. The library contains 10,550 bound volumes. The president in 1916 was Francis L. Strickland, D.D.

**SIMROCK, zím'rók, KARL JOSEPH** (1802-76). A German poet and scholar. He was born at Bonn, studied law there and at Berlin law and philology, entered the civil service in 1826, and in 1827 published a translation of the *Nibelungenlied*, which has become classic in more than 50 editions. He followed this with metrical renderings of Hartmann von Aue's *Der arme Heinrich* (1830), was expelled from the Prussian service for a political poem, and gave himself wholly to literature, translating the poems of Walther von der Vogelweide (1833), the *Parzival* of Wolfram von Eschenbach (1842), *Reineke Fuchs* (1845), the *Edda* (1851), Gottfried von Strassburg's *Tristan und Isolde* (1855), the Old Saxon *Heliand* (1856), the Anglo-Saxon *Beowulf* (1859), *Der Wartburgkrieg* (1858), Brant's *Narrenschiff* (1872), some of Shakespeare's dramas, and other less important works. From 1850 till his death he was professor of the Old German language and literature at Bonn. Consult Hocker, *Karl Simrock* (Leipzig, 1877).

**SIMS, simz, GEORGE ROBERT** (1847-1922). An English journalist and playwright. He was born in London and made his home there, becoming almost as familiar with the darker sides of London life as was Dickens. He was educated at Hanwell College and at Bonn. On the death

of Thomas Hood the Younger, in 1874, he joined the staff of *Fun*, and in the same year he began writing for the *Dispatch*, in which first appeared his sketches under the title of *Social Kaleidoscope*, the *Three Brass Balls*, and *The Theatre of Life*. These were popular and were translated into French and German. From the feuilleton he drifted into light verse, contributing to the *Referee* the *Dagonet Ballads* (collected in 1882). Among other volumes of his verse are *Ballads and Poems* (1879), *The Land of Gold* (1883), and *Dagonet Ditties* (1893). Turning to the drama, Sims wrote many plays—farces like the *Crutch and Toothpick* (1879), followed by *Mother-in-Law* and *The Member for Slocum*. His greatest success awaited him in melodrama. *The Lights of London*, first produced at the Princess's Theatre in 1881, had an extraordinary run in London and afterward in the colonies and in the United States. Almost equally popular was *In the Ranks*, first performed at the Adelphi in 1883. Among Sims's other plays are: *The Romany Rye*; *The Golden Ring*; *Harbour Lights*; *In Gay Piccadilly*; *A Scarlet Sin*. His plays presented striking phases of contemporary London life. His *How the Poor Live* (1883) and his various contributions to the London *Daily News* on the housing of the poor awakened much attention and led to reforms. Throughout a long career he continued active in the fields indicated by the works already named. For Sims as a dramatist, consult William Archer, *English Dramatists of To-Day* (London, 1882), which considers his earlier work.

**SIMS, JAMES MARION** (1813-83). An American gynæcologist, born in South Carolina. He was graduated in medicine by Jefferson Medical College, Philadelphia, in 1835 and entered upon the practice of his profession at Montgomery, Ala., in 1836. About 1845 he became interested in vesico-vaginal fistula, hitherto incurable, and established a private hospital for women, supporting this several years at his own expense. The success of his operations at closing these fistulae was due, he stated, to the substitution of silver wire for silk and other sutures. He afterward extended the use of metallic sutures to general surgery. He published a full account of his operation in the *American Journal of Medical Sciences* in 1852. He settled in New York City in 1853 and was instrumental in establishing the Woman's Hospital. In 1861 Dr. Sims went to Europe, living mostly in Paris and returning to New York in 1868. While on a visit to Paris in 1870 he organized the Anglo-American ambulance corps, of which he took charge and which he accompanied to Sedan. In 1876 he was president of the American Medical Association. The so-called "Sims's position," "Sims's speculum," and "Sims's operation" have been of incalculable benefit; he deserves a place as an inventive genius among the great surgeons of the world. There is a monument to him in Bryant Park, New York. He published *Trismus Nascentium* (1846); *Silver Sutures in Surgery* (1858); *On Intra-Uterine Fibroid Tumors* (1874); *Clinical Notes on Uterine Surgery* (1866; Ger. trans.); *Anglo-American Ambulance* (1870); *The Discovery of Anæsthesia* (1877). Consult his *Story of my Life*, edited by H. M. Sims (New York, 1884); also Austin Flint, *In Memoriam James Marion Sims* (ib., 1886).

**SIMS, THOMAS M.** A fugitive slave, returned to slavery from Boston, Mass., in 1851. He had escaped from slavery at Savannah, Ga., in 1851

and reached Boston in February on a trading vessel, but on April 3 was arrested in pursuance of the Fugitive Slave Law (q.v.) and confined in the Boston courthouse. His arrest caused great excitement in Boston, and vigorous but unavailing efforts were made by Abolitionists to secure his release, public meetings being held at which such men as Phillips, Parker, Garrison, Horace Mann, Henry Wilson, and T. W. Higginson delivered addresses. Sims was tried before United States Commissioner George T. Curtis (q.v.), was surrendered to the representative of his master, one James Potter, and returned to Savannah. Unsuccessful attempts were made by Northern people, especially by Charles Devens (q.v.), the marshal who caused his arrest, to buy and emancipate him. In 1863 he escaped to Grant's army at Vicksburg and after 1877 was a messenger in the Department of Justice in Washington. Consult C. F. Adams, *Richard Henry Dana: A Biography* (Boston, 1891); also the *New England Magazine*, vol. ii (N. S., Boston, 1890).

**SIMS, WILLIAM SOWDEN** (1858– ). An American naval officer, born at Port Hope, Canada. After graduating from the United States Naval Academy in 1880, he was promoted through the various grades to commander in 1907 and captain in 1911. He served on the North Atlantic, Pacific, and China stations, from 1897 to 1900 was naval attaché to the American embassies at Paris and St. Petersburg, and then served with the Asiatic fleet. In 1902–09 he was inspector of target practice at the Bureau of Navigation and in 1907–09 was also naval aid to the President. He then commanded the *Minnesota* in 1909–11, was a member of the Naval War College in 1911–13, and after 1913 commanded the Atlantic torpedo flotilla.

**SIMS, WINFIELD SCOTT** (1844– ). An American inventor, born in New York City. He served in the Civil War in a New Jersey regiment. He experimented with electromagnets and electromotors and was the first to apply electricity to the propulsion and guidance of torpedoes. (See **TORPEDO**.) He invented the Sims-Dudley dynamite gun, a wireless dirigible torpedo, and a dynamite gun for aeroplanes.

**SIMSBURY**, simz'bēr-ī. A town in Hartford Co., Conn., 14 miles northwest of Hartford, on the Farmington River, and on the Central New England and the New York, New Haven, and Hartford railroads (Map: Connecticut, D 2). It has a public library and a high school. The manufacture of safety fuse constitutes the chief industry. Pop., 1900, 2094; 1910, 2537. Consult Noah A. Phelps, *History of Simsbury* (1845).

**SIMSON, simz'son, MARTIN EDUARD VON** (1810–99). A German jurist and parliamentarian, born at Königsberg. After studying there, in Berlin, Bonn, and Paris, he began to lecture in his native city in 1831 and became professor there in 1836 and a judge of the higher court in 1846. Elected to the National Assembly at Frankfurt in 1848, he was successively its Secretary, Vice President, and President, and in 1849 headed the delegation which announced to the King of Prussia his election as German Emperor. In the same year he represented Königsberg in the Prussian Second Chamber with rare oratorical skill and in 1850 presided over the Erfurt Parliament. Having confined himself to his juridical and academic duties from 1852 to 1858, he was again returned to the House of Representatives in 1859, was its president in 1860–

61, and of the North German Reichstag from 1867 on, in which capacity he headed the deputation which petitioned King William I at Versailles, December, 1870, to accept the Imperial crown offered him by the German princes. In 1869 he became presiding judge of the Court of Appeals at Frankfurt-on-the-Oder. Subsequently also President of the German Reichstag, he declined a reelection in 1874, owing to impaired health, was appointed president of the Supreme Court at Leipzig in 1879, and retired in 1892, settling in Berlin.

His son, **BERNHARD** (1840– ), born at Königsberg, professor of history at Freiburg from 1877 to 1905, is known as the author of *Jahrbücher des frankischen Reichs unter Ludwig dem Frommen* (1874–76) and *unter Karl dem Grossen* (1883) of the sixth volume of Giesebrecht's *Geschichte der deutschen Kaiserzeit* (1895) and of a biography of his father (Leipzig, 1900). He wrote also *Die Entstehungen der Pseudo-Isidorischen Fälschungen* (1886) and a number of historical essays.

**SIMSON, ROBERT** (1687–1768). A Scottish mathematician, born at West Kilbride, Ayrshire. He was educated at Glasgow University and in London. At the age of 24 he was elected professor of mathematics in Glasgow University. Directed by Halley to the study of Greek mathematics, he devoted much of his life in making the early classics in geometry known in England. In 1761 he retired from his active work in the university and devoted the remaining years of his life to revising his works. Besides numerous memoirs, Simson published the following works: *Sectionum Conicarum Libri V* (1735; 2d ed., 1750; Eng. trans., 1804); *Apollonii Pergæi Locorum Planorum Libri II* (1749; Ger. trans., 1822); *Elements of Euclid* (1756, and many subsequent editions). His collected works were published at Glasgow in 1776.

**SIN** (AS. *synn*; probably connected with Lat. *sons*, guilty). Voluntary transgression of a moral law believed to possess divine sanction. In primitive life there is no sharp distinction between human and divine law; all social customs and traditions are under the sanction of whatever divine power the tribe may recognize. In such cases the elements of a conception of sin are present, but the acts of conduct to which it is applied will vary according to the advance of civilization. In the more developed religions the conception of sin is determined by the place given to human responsibility. Where the freedom of will is emphasized, as in Zoroastrianism, there is a clear sense of sin. Where man comes to be considered as not a free personality, but determined in his action by destiny, karma, or any force outside his own control, as in Hinduism, there is no sin, in the Christian sense of the word.

Among the Greeks and Romans the idea of sin takes on the more positive character of their life and temperament. The essential excellence of human nature and the power of the human will, unaided, to attain a high standard of virtue, was part of the genius of the Græco-Roman civilization. If men did not rise to the moral heights open to them, the lack constituted sin.

With Christianity there came a change, the chief causes of which were the emphasis on the ethical code as a divine command and the teach-

ing of the doctrine of a future life, especially the doctrine of penalty for sin. This acted as a strong deterring influence, which showed itself still further in the practice of self-accusation and in the habit of affixing personal responsibility for the smallest departures from the divine law. In their conflict with paganism and Greek philosophy the early fathers were led to define the nature of sin more fully and precisely. We find two broadly divided schools. One regarded sin as an individual affair, as a voluntary act. The other regarded it as a matter of the race, as a taint of hereditary depravity and corruption. The former school held that moral responsibility was confined to the individual's own acts; the latter, that this responsibility is shared and conditioned by the race as such. Out of these opposing views arose the distinction between actual and original (q.v.) sin. See AUGUSTINIANS; PELAGIANISM; SEMI-PELAGIANISM.

In modern thought sin is studied for the most part in connection with theodicy, psychological ethics, and sociology. The study assumes three forms: (1) the inquiry into the origin of evil; (2) the question of freedom and necessity; and (3) the relation of sin to final causes. Descartes and Spinoza practically denied the positive character of sin, as did Malebranche, who, however, maintained that sin is a phenomenon through which God occasionally acts, as He might through any other act of a human being. For Leibnitz, the author of the most original system of theodicy, evil is the contrast to the good. The origin of evil therefore is not to be found in the divine will, nor entirely in the action of man, but rather in the essential limitations of matter, which is the condition of realizing the good. Thus, evil is merely privation and has no true cause. In regard to the question of freedom Spinoza's theory of universal determinism led him to attribute freedom to God alone, and, of course, this caused him to deny the reality of free agency. Descartes' view that God creates the distinction between truth and falsehood, right and wrong, tended in the same direction. Leibnitz, on the other hand, while admitting that God is the only complete and perfect cause, nevertheless contended that He has, in creating man, conferred upon him the prerogative of freedom.

After Leibnitz we find no original systems of theodicy, and the problem of sin tends to be considered in connection with psychological ethics and sociology. Its subjective character and its reflex action on social life are the chief matters of interest to the more modern mind. Physical conditions are now admittedly agreed to be important predisposing factors of sin. The part played by choice, by feelings of fear, and by the primitive passions in perverting human nature is also fully acknowledged, especially in determining the intention of the act of sin and its relation to the universal disapproval that accompanies wrongdoing (guilt). Evolution exhibits sin as the constant struggle of the inherited lower nature against the steadily rising ideals of humanity in its progress. The vast social significance of the fact of sin has been fully recognized, as appears in all modern systems of penology in which remedial measures are applied to the correction of the habitual criminal. It is also seen in the importance now attached to the moral education of the young as a means of combating the liability to wrongdoing in the human race.

See also DEVIL; EVIL; ORIGINAL SIN; VENIAL SIN.

**SINAI**, sī'nī or sī'nā-i (Heb., probably "belonging to Sin," the moon god). The name of a mountain in Arabia (Gal. iv. 25) before which Israel encamped and on the top of which Moses received the Law, according to Ex. xix. ff. and whence Yahwe was regarded as coming to the help of his people (Deut. ii. 2; Judg. xxxiii. 2; Hab. iii. 3; Ps. lxxviii. 9). The location is uncertain. In Christian times it has been identified with various peaks on the so-called Sinaitic Peninsula (q.v.). Hermits retreated to these mountains at least as early as in the time of Emperor Julian (361-363). Some of them looked upon Jebel Serbal as Sinai, or Horeb. This was evidently the view of Cosmas Indicopleustes (c.536), who regarded the inscriptions, which are especially numerous here, as coming from the Israelites. (See SINAITIC INSCRIPTIONS.) Others thought of Jebel Musa. It is possible that this mountain was originally named after the famous saint, Bishop Moses (c.375), whose story is told by Socrates (iv, 36) and Theodoret (iv, 23). Silvia of Aquitaine (c.390) apparently visited this place and called it Syna. Here Justinian built in 530 on the northern slope a fortress, to which the monks of Jebel Serbal gradually went for protection and which afterward became a monastery dedicated to St. Catharine of Alexandria, as well as a church of the Virgin somewhat higher up. In modern times Ras al Safsaf (Robinson) and Jebel Katherin (Rüppell) have been suggested. On the other hand Grätz considered Jebel Araf immediately south of Kadesh Barnea (q.v.) as Sinai and the views of Haynes and Cheyne are essentially in harmony with this. But more importance attaches to the opinion of Beke, who already in 1834 maintained that it should be sought east of the Gulf of Akabah. After a visit to the place in 1873, he concluded that Jebel al Nur was Sinai, though disappointed in not finding it a volcano. Musil in 1911 identified Sinai with the extinct volcano al Badr, "the moon" (lat. 37° 10' E., long. 27° 10' N.), near which is a wide, fruitful, and fairly well watered plain. This may be too far south; but the biblical references connecting Sinai with Mount Seir, Edom, and the land of Midian seem clearly to indicate this region east of the Ælantic Gulf, as has been pointed out by Wellhausen (1886), Sayce (1894), Moore (1895), Stade (1897), Gall (1898), Gunkel (1903), Eduard Meyer (1906), Schmidt (1908), Gressmann (1913), Haupt (1914), and others. "The Mount of God, Horeb" (Ex. iii. 1 et al.; 1 Kings xix. 8) has generally been regarded as only another name for Sinai. According to the current system of Pentateuchal analysis Horeb is used by E. and D., Sinai by J. and P. There may, however, have been two distinct

mountains in the original narrative, afterward confused. Robinson thought of Jebel Musa and Ras al Safsaf, Cheyne of a Horeb west and a Sinai east of the Gulf of Akabah, and Winckler of two neighboring mountains, like Ebal and Gerizim, in the region of Edom—one dedicated to the moon, the other to the sun (the "glowing heat"). In the present state of our knowledge this question, like that of the exact location, admits of no decisive answer.

**SINAITIC** (sī'nā-īt'ik) **INSCRIPTIONS.** The designation of a large number of brief inscriptions found on the Sinaitic Peninsula (q.v.), chiefly in the Wadi al Mukattib, near Feran, at Jebel Serbal, and near Jebel Musa, formerly imagined to be the work of Israelites during their sojourn at Sinai, but now known to be Nabatean and coming from the first centuries of our era, for the most part being the graffiti of pagan pilgrims or merchants. Of the nearly 2000 inscriptions known the vast majority seem to come from the period between 189 and 250 A.D. Their true origin was first recognized by E. F. E. Beer (*Studia Asiatica* (Leipzig, 1840). Six hundred were copied by J. Euting and published by him under the title *Sinaitische Inschriften* (Berlin, 1891); the most complete collection is that of M. de Vogüé, in *Corpus Inscriptionum Semiticarum*, ii, 1 (Paris, 1902), from the copies of E. Bénédict, provided with an excellent introduction.

**SINAITIC MANUSCRIPT.** See BIBLE.

**SINAITIC PENINSULA.** A common designation of the territory projecting into the Red Sea between the Gulf of Suez and the Gulf of Akabah. Politically, in 1915, it belonged to the British Protectorate of Egypt. The northern part, al Tih, is an arid desert; the southern, al Tur, a mountainous region. The latter consists of three groups: a northwestern, reaching in Jebel Serbal a height of 6759 feet; a central, including Jebel Musa (7519 feet), Ras al Safsaf (6541 feet), Jebel Zebir (8531 feet) and, the highest of all, Jebel Katherin (8551 feet); and a southeastern, whose highest peak is Jebel Umm Shomer (8449). In Wadi Maghara, at Sarbut al Khadim, and in Wadi Nasb there are numerous Egyptian inscriptions, mentioning not less than 39 kings from the 1st to the XIIth dynasty. Struggles with the natives, the Menziu, are represented, and references are made to the copper and malachite (Egyptian, *mafkat*) secured in these places. At Sarbut al Khadim

there are the ruins of a Hathor temple and some evidences of a still earlier Astarte temple. In the early centuries of our era especially the neighborhood of Jebel Serbal was visited by pilgrims and merchants on their way to Aila. (See SINAITIC INSCRIPTIONS.) From the fourth century the peninsula was peopled by anchorites who suffered much from the attacks of Saracens and Blemmyans. Against these Justinian's castle on Jebel Musa gave them some protection. After the Moslem invasion the convent of St. Catharine was the chief centre of Christian monastic life. In 1398 there were still six other convents, but these seem to have been abandoned soon after this time. Among the literary treasures of the convent of St. Catharine may be mentioned *Codex Sinaiticus* discovered by Tischendorf in 1844 and 1859, now in Leipzig and Petrograd, and *Codex Sinaiticus Syriacus* discovered by Mrs. Margaret Dunlop Gibson and Mrs. Agnes Smith Lewis in 1892. (See BIBLE.) There are at present about 6000 Tawarah Bedouins of five tribes and a few hundred Jebeliyeh, or vassals of the monastery, descendants of 200 Wallachians and 200 Egyptians given to the convent by Justinian. There is no reason to think that in historic times the peninsula has been able to support a much larger population. Consult: Edward Robinson, *Biblical Researches in Palestine* (2d ed., New York, 1856); Edward Hull, *Mount Seir, Sinai, and West Palestine* (London, 1885); A. P. Stanley, *Sinai and Palestine* (2d ed., ib., 1905); W. M. Flinders Petrie, *Researches in Sinai* (ib., 1906); M. J. Rendall, *Sinai in Spring* (ib., 1911).

**SINALOA**, sē'nā-lō'ā. A Pacific state of Mexico (Map: Mexico, E 5). Area, 27,553 square miles. The coast is low and lined with numerous lagoons. The interior rises gradually from the coast, and the eastern part is occupied by the Sierra Madre Mountains. The state is well watered, and some of the rivers are partly navigable. The climate is hot and unhealthy on the coast, but more moderate in the highlands. Rains are abundant in the mountains, and the mountain slopes are well wooded. Mining is the chief industry; the principal metals are gold, silver, copper, iron, and lead. Agriculture and stock raising are also carried on. The chief manufactured product is cotton cloth. Pop., 1910, 323,642, including many Indians. Capital, Culiacán (q.v.).

**SINCERE BRETHREN** (Ar. *Ikhwān al Safā wa Khullān al Wafā*, the Sincere Brethren and True Friends). A transcendental and scientific order of esoteric nature in Islam, existing at Basra on the lower Euphrates about 1000. (See SHIITES.) Little is known of the personality of the members, the leader of whom may have been one Zayd ibn Rifaa. It was a constituent part of their philosophy that perfection could be reached only through the coöperation of souls, each contributing its share to the common treasury of goodness and knowledge; hence logically their association took the form of an esoteric society with a simple organization into which any sincere and helpful-spirited man could enter. The order was divided into four ideal grades: the first for the younger members and for those of practical ability; the second for those over 30 years who could fulfill the office of teachers; the third for those over 40 who could rule in the society, their authority being one of mildness and admonition; the fourth for those who were fit to attain the vision of

God. The *Epistles of the Sincere Brethren* (*Rasā'il Ikhuḍn al-Safā*) consists of 51 treatises and is an encyclopedia of the Arabic philosophy of the age. This is based upon Neoplatonic and other late Greek philosophies, with evident contributions from Oriental mysticism, the authors being Shiite. The doctrine is that of an All-Soul, which first projects matter from itself and continuously spiritualizes it by emanations: on the other hand these soul parts naturally yearn for return to their origin. But this redemption is hampered by the opposition of spirit and matter. The ethics of the encyclopedia therefore inculcates the gradual self-purification of those who recognize their spiritual birthright to develop away from sense to God. But while ethically dualistic, the encyclopedia has a pantheistic metaphysics and is interested in all created things as being immediately derived from God. The Sincere Brethren, among whom were such eminent men as Mukaddasi (q.v.), also seem to have accepted from Greek sources many advanced ideas of a scientific nature, such as the belief in the spherical character of the earth and its rotation around the sun. The work has been made known to modern Europe through the labors of Dieterici in a series of translations published between 1861 and 1872 (Berlin and Leipzig), concluding with a general survey in *Die Philosophie der Araber* (Leipzig, 1876-79). He has also published as a translation one of the episodes, *Der Streit zwischen Mensch und Thier* (Berlin, 1858), and its original (ib., 1879); also a selection of the original texts in *Abhandlungen der Ichwān es-Safā* (ib., 1883-86). Consult Flügel, in *Zeitschrift der deutschen morgenländischen Gesellschaft*, vol. xiii (Leipzig, 1859), and Stanley Lane-Poole, *Studies in a Mosque* (London, 1883).

**SINCLAIR**, sin'klār, ALEXANDER MACLEAN (1840- ). A Canadian Gaelic scholar. He was born at Glen Bard, Antigonish County, Nova Scotia, studied for the ministry at the Presbyterian College, Halifax, and was ordained in 1866. He held pastorates at Springville, Nova Scotia, Belfast, Prince Edward Island, and Hopewell, Nova Scotia. In 1907 he was appointed lecturer in the Gaelic language and literature at Dalhousie University. His publications include: *A Collection of Gaelic Poetry* (1881); *Gaelic Hymns* (1881); *The Gaelic Bards from 1411 to 1715* (1890); *The Gaelic Bards from 1775 to 1825* (1896); *The Clan Gillean, or History of the Macleans* (1899); *Maectalla nan Tur* (1901).

**SINCLAIR**, SIR JOHN (1754-1835). A Scottish politician and author. He was born at Thurso Castle, Caithness, studied at Edinburgh, Glasgow, and Oxford, and was admitted to the English bar (1782). With slight interruptions he sat in Parliament from 1780 to 1811. In 1793 he established the Board of Agriculture, of which he was for 13 years president. In 1786 he was created Baronet. He published his *History of the Public Revenue of the British Empire* (2 vols., 1784; 3d ed., 1803-04); but his chief work is the *Statistical Account of Scotland* (21 vols., 1791-99). Consult his *Correspondence* (2 vols., 1831).

**SINCLAIR**, MAY (?- ). An English author, born at Rock Ferry, Cheshire, and educated at the Ladies' College, Cheltenham. Criticism, verse, short stories, and novels came from her pen before she made a substantial success—a success greater in America than in

England—with her *The Divine Fire* (1904). Other publications of hers are: *Audrey Craven* (1906); *The Tysons* (Mr. and Mrs. Nevill Tyson) (1906); *The Helpmate* (1907); *The Judgment of Eve* (1908); *Kitty Tailleure* (1908); *The Three Brontes* (1912); *Feminism* (1912); *The Combined Maze* (1913); *The Return of the Prodigal* (1914); *The Three Sisters* (1914); *A Journal of Impressions in Belgium* (1915)—Miss Sinclair served as a nurse after the invasion of Belgium; *The Belfry* (1916).

**SINCLAIR**, UPTON (BEALL) (1878- ). An American author and Socialist, born in Baltimore. He graduated at the College of the City of New York in 1897 and studied also at Columbia. His novel, *The Jungle* (1906), led President Roosevelt to order an investigation of the Chicago stockyards, which brought to light serious abuses. In October, 1906, Sinclair organized the New York Home Colony, in which several families agreed to try coöperative living in a building known as Helicon Hall, near Englewood, N. J. The building was destroyed by fire in 1907. He was one of the founders of the Intercollegiate Socialist Society. Among his publications are: *Springtime and Harvest* (1901); *The Journal of Arthur Stirring* (1903); *Manassas* (1904); *The Industrial Republic* (1907); *The Money-Changers* (1908); *Samuel, the Seeker* (1909); *The Fasting Cure* (1911); *Sylvia* (1913); *Sylvia's Marriage* (1914); *The Cry for Justice: An Anthology* (1915).

**SIND**, **SINDH**, or **SCINDE**, sind. A region in the northwestern part of British India, now forming a division of the Bombay Presidency. It lies around the lower course of the Indus (Map: India, A 3). The area under British administration covers 46,086 square miles, and the total area, including the native State of Khairpur, is 53,036 square miles. Sind is a great silt-formed area of very low, flat doabs, or interfluvial regions, lying between the branches of the great Indus delta. These doabs consist mostly of alluvial clay baked hard in the sun. In the west Sind is like the Punjab and in the east much like Rajputana, more inhospitable and waste than anything in the Punjab, subject to scorching winds little relieved by rainfall. The arable soil consists of the rich alluvium deposited in the periodic river floods.

Agriculture is much dependent on irrigation, secured through a system of canals leading from the Indus River and from the annual overflow of that river. The extension of these canals by the government in recent years has increased cultivated areas. In 1912-13 the net area cropped was 3,990,570 acres. There are generally two harvests per annum: the first, or rabi (spring), harvest consists of wheat, barley, oil seeds, millet, durra, opium, hemp, and tobacco; the second, or kharif (autumn), harvest consists of those crops whose ripening requires much heat, as rice, sugar cane, cotton, indigo, and maize. The Northwest Railroad extends from Karachi northward through the region. Karachi (q.v.) is the principal port for the Punjab and northwest India. Pop., 1901, 3,210,910; 1911, 3,513,435. In 1911 Mohammedans numbered 2,639,929; Hindus, 837,887; Sikhs, 11,166; Christians, 10,911; Parsis, 2411; Jains, 1949; animists, 8869. The principal language is Sindhi (q.v.); in 1911 this was the language of 3,669,935 persons in India. The capital of Sind is Karachi.

From the early part of the eleventh century Sind was generally under Mohammedan domination. Among the mediæval ruling powers were the dynasties of Ghazni and Ghuri (q.v.). Towards the close of the sixteenth century it passed under the sway of the Great Mogul. (See *MOGUL, GREAT*.) In 1748 it became a feudatory dependency of the Durani dynasty of Kandahar. A little more than a generation later the Talpur Baluchis, who had immigrated into Sind, raised their leader, Mir Fath Ali, to supreme power. This chief made large grants of territory to various relatives, reserving most of Lower Sind for himself and his three brothers, so that there were four ameers at Hyderabad, three at Khairpur, and one at Mirpur. On the outbreak of the Afghan War in 1838, the British government intimated its intention to take temporary possession of Shikarpur and forced the ameers of Hyderabad and Mirpur to agree to a treaty which virtually destroyed their independence. War with Great Britain broke out in 1843, following an attack on the British Residency, and an expedition under Sir Charles James Napier, the British envoy, routed the native forces at Miani and soon completed the subjugation of Sind. The conquered territory was divided into three collectorates, now the districts of Hyderabad, Karachi, and Shikarpur; the Ameer of Khairpur, by continuing faithful to the British, retained his dominions. Consult Hughes, *A Gazetteer of the Province of Scinde* (2d ed., London, 1876), and Sir R. F. Burton, *Sind Revisited* (ib., 1896).

**SINDBAD** (or **SINBAD**) **THE SAILOR.** The hero of one of the tales of the *Arabian Nights*.

**SINDER.** See **ZINDER**.

**SINDHI** (sin'dê or sin'd'hê) **LANGUAGE AND LITERATURE.** The modern Indian language and literature of Sind (q.v.). Sindhi is derived from Apabhraṃśa Prakrit (see **PRAKRIT**), spoken in mediæval times about the mouth of the Indus. Of all the Indian group of languages Sindhi is in many respects the most interesting linguistically. Its nearest relative is Lahnda, the language of western Punjab. While it is, generally speaking, an analytic language of the same type as English, it retains a number of Prakrit elements, which have been discarded elsewhere. There are, as in Sanskrit (q.v.), eight cases, formed chiefly by postpositions, and the verb has three simple tenses, potential, aorist, and future, from which the various periphrastic tenses are formed (e.g., *āmūṃ halām*, I may go; *halandō huām*, I may be going; *halīō huām*, I may have gone; *halām thō*, I go; *halandō āmhiyām*, I am going; *halandō hōse*, I was going; *haliuse*, I went; *haliuse thē*, I used to go; *halīō āmhiyām*, I have gone; *halīō hōse*, I had gone; *halanduse*, I shall go; *halandō hunduse*, I shall be going; *halīō hunduse*, I shall have gone). The past tenses of the transitive verb are lacking, and their place is supplied by the passive with the agent in the instrumental case. In its vocabulary Sindhi, being the first language of India to come under Mohammedan influence, has incorporated many Persian and Arabic loan words. On the other hand it has borrowed a smaller number of Sanskrit words than any of the other modern Indian languages. Sindhi is divided into a number of dialects which shade imperceptibly one into another. The most important are Lari, in the Indus delta; Thareli, in the Sind

desert; and the one which may be called the standard, Kachhi, in Cutch. Among the other dialects are Jathki, Vicholi, Sirai, and Jadgali. The alphabets were formerly numerous, but fell into two classes, the Arabic and those derived from the Sanskrit Devanagari (q.v.), and uniformity in this regard has not yet been attained. The distinction in usage was primarily religious, Arabic letters being used by the Mohammedans, while the Hindus clung to the Indian characters. Sindhi literature is scanty, but there is a rich store of popular poetry, tales, and the like which are being reduced to writing. According to the census of 1901 there were 3,494,971 persons speaking Sindhi and 3,337,917 speaking Lahnda.

Temple, *Legends of the Panjab* (3 vols., Bombay, 1884-1900).

**SINDIA**, sin'di-ā. The name of a Mahratta house which played an important part in the history of India during the eighteenth and nineteenth centuries. The Sindia arose in Gwalior, of which the rulers still bear this name, and was of low caste. Its founder was Ranoji Sindia, who had risen to be commander of the Peshwa's bodyguard, and after 1743 received an hereditary fief. His natural son Madhava Rao (or Mahadji) Sindia (1750-84) became chief of the Mahratta princes in 1767. Four years later, with the coöperation of the Peshwa, Madhu Rao, he assisted the Mogul Emperor of Delhi, Shah Alam, to expel the Sikhs from his territories. As a reward for his services Madhava Rao was given control of these lands. He fought against the English in the first Mahratta War (1779-82), which terminated in the Treaty of Salbai, according to the terms of which he received the districts won in Gujarat. Later (1784) he captured Gwalior, after which he seized Delhi and almost the entire Doab (q.v.) and subjugated three of the Rajput states. Madhava Rao died in 1794 and was succeeded by his grandnephew Daulat Rao (1794-1827), who played a prominent part in the Second Mahratta War, which broke out in 1803. During the same year his forces were defeated at Assaye and Argaum by Sir Arthur Wellesley, afterward Duke of Wellington, and he renounced all his claims to territory between the Jumna and the Ganges as well as his provinces in Gujarat. After this Daulat coöperated with the English, helping them in 1804 against Jaswant Rao Holkar, for which he was given Gwalior in 1805 as his capital. In 1817 he was suspected of treasonable negotiations with Nepal and during the following year was compelled to sign a treaty by which he lost Ajmere and other states. He died in 1827 without issue, and his widow, Baiza Bai, adopted Janokji (or Mugat) Rao

Sindia (1827-43). His rule was weak, and in 1843 he died, leaving no heirs. His girl widow, Tara Bai, adopted a boy of eight years, Jayaji Rao Sindia (1843-86). The dominions of Gwalior were in such a state of anarchy that the British were forced to intervene, and a war followed, in which the Mahrattas were routed (Dec. 29, 1843) by Sir Hugh Gough at Maharajpur and on the same day by General Grey at Panniar. The British then seized Gwalior and obliged the Sindia to maintain thereafter a Sepoy contingent in that place. In 1858 this contingent joined the Sepoy mutiny and forced the Sindia, who remained loyal to the British, to flee to Agra. On June 19, 1858, he was reinstated by Sir Hugh Rose and received various tokens of appreciation of his loyalty. On his death, in 1886, Jayaji Rao was succeeded by his adopted son, Madhava Rao Sindia, an enlightened prince who was active in reform and good government. His loyalty to the British was shown in 1901, when he equipped at his own expense and accompanied a hospital ship for the China War. Consult H. G. Keene, *Madhava Rao Sindia* (Oxford, 1891), and James Burgess, *The Chronology of Modern India, 1494-1894* (Edinburgh, 1913).

**SIN'DING, CHRISTIAN** (1856- ). A Norwegian composer, born at Kongsberg, Norway. In 1874 he became one of Reinecke's pupils at the Leipzig Conservatory and studied with him for three years. In 1880, with the Royal scholarship, he studied at Dresden, Munich, and Berlin. He finally settled as organist and teacher at Christiania. His compositions, the most notable of which are for the piano, are remarkable for their brilliancy and Norwegian characteristics. Among his works are a pianoforte quartet; a pianoforte quintet; a string quartet; two symphonies (D minor and D major); three violin sonatas; romanze for the violin with the piano; a concerto for violin, op. 45; a concerto for viola; a suite for flute and orchestra; variations for two pianos; songs and piano pieces. An opera *Der heilige Berg*, was produced in Dessau (1914).

**SINDING, OTTO LUDWIG** (1842-1911). A Norwegian landscape and genre painter, born at Kongsberg. He studied under Eckersberg in Christiania, under Gude and Riefstahl at Karlsruhe, and under Piloty at Munich. His art is less characteristically northern than that of most Scandinavian painters, although in his coast scenes of the Lofoten, such as "From Reine" (Christiania Gallery) and "Laplanders Greeting the Return of the Sun," he proved himself a gifted interpreter of his own rugged land. He also essayed religious paintings; genre scenes, notably "Struggle at a Peasant's Wedding"; fantastic compositions in the manner of Böcklin and Thoma; and marines, such as "The Surf."

**SINDING, STEFAN** (1846-1922). A Norwegian sculptor. He was born at Trondhjem and after taking the degree of Ph.D. at Christiania University he turned to sculpture, which he studied in Christiania and in Berlin (1871-74) under Albert Wolff. He afterward lived and worked in Paris, Christiania, Rome (1877-84), and Copenhagen, where his early patron, Dr. Jacobsen, collected his finest statues in the Ny-Carlsberg Glyptothek. Sinding became known as the foremost Norwegian sculptor. In his first important work, the group "A Barbarian Mother" (1882), he broke away from the classic

traditions of Thorvaldsen, until then supreme in Scandinavia. This was followed by the "Captive Mother" (Medal of honor, Paris, 1889) and "Man and Woman," the first examples of a subject frequently treated by him but without sentimentality or sensualism. Among other celebrated works are the wooden statue "Eldest of her Kin" (1897); "Mother Earth" (1900); "The Valkyrie" (wood, 1902; bronze, 1908); "Adoration" (1903); "May" (1910) and the "Valhalla" frieze (1887-1904), all in the Ny-Carlsberg Glyptothek; and the monuments to Ole Bull at Bergen, to Ibsen and Björnson in Christiania. Sinding's chief characteristics are absolute truthfulness, energy, artistic imagination, creative power, and love of beautiful contours. Consult M. Rapsilber, *Stephan Sinding* (Berlin, 1911).

**SINE**. See CURVE OF SINES; TRIGONOMETRY. **SINGAKADEMIE**, zing'á-ká-dá-mé'. See CITORAL SOCIETIES.

**SINGANFU**, sŭng'án'fŭ, **SIGANFU**, or **SIANFU** (Chin., west tranquil city), also sometimes spelled HSIANFU. Residence of the Shen-Kan, or Governor-General of the United Provinces of Shensi and Shansi. A departmental city of China, capital of the Province of Shensi (q.v.), and noted for its antiquity as well as its importance as a commercial centre (Map: China, K 5). It is finely situated near the Wei River, the principal affluent of the Hoang-ho in the midst of a great loess plateau sloping southward from the high table-lands of Mongolia to the Tsing-ling Range, and eastward from Kansu to the Hoang-ho. Its walls are not so high as those of Peking, but the four great gates with their lofty towers surpass those of Peking in magnificence. They are well built and in 1869-71 successfully withstood the attacks of the Mohammedan hosts then in rebellion. They have a circuit of 24 miles and are built in the form of a square, with each side about 6 miles in length. The streets are wide, well paved, and clean and lined with fine shops and warehouses. An immense trade is carried on here, for here the great trade routes from the northeast, east, and south through Kansu to Ili (2773 miles), Yarkand (3198), Kashgar (3361), and other Central Asian points converge. Pop. (est.), around 1,000,000, including 50,000 Mohammedans, and many Tibetans, Mongols, etc.

On this spot or in its vicinity several dynasties established their capital, beginning with the Chow in 1122 B.C. Under the name of Kwanchang it was the capital of the Emperor Shi-Huang-ti (246-210 B.C.), the famous "burner of the books." The neighborhood of Singanfu is rich in objects of great antiquarian interest. Among them is the oldest mosque in China, built over 1100 years ago, a very old temple dedicated to Lao-tse; the Pei-lin, or "Forest of Tablets," belonging to different dynasties from 100 B.C., and collected from many quarters, consisting of some 1300 incised specimens of calligraphy, emblematic animals, historic scenes, etc., and the "Thirteen Classics" cut in stone in the T'ang dynasty (618-960); and in the Manchu City in the northwest quarter of the city is an old palace of the same period. Here in 1625 was discovered a large stone tablet (erected in 781 and still preserved), carved with Chinese and Syriac writing recording the establishment of Christianity in this neighborhood in the seventh century by the Nestorians and eulogizing it as the King-Kiao or "Luminous

Religion." (See NESTORIAN MONUMENT.) Singanfu suffered much during the Mohammedan rebellion of 1865-78, but has now almost recovered. During the advance of the allied troops for the relief of the beleaguered foreigners in Peking in 1900 the Emperor and Empress Dowager fled hither and kept their court here until November, 1901. On October, 1911, Singanfu joined the revolt against the Manchu monarchy. The position of Singanfu is of great strategic advantage, which makes it the most important city in northwest China. It has hardly yet been modernized, although a cotton mill was established in 1899.

**SINGAPORE**, sin'gà-pōr'. An island, the most important of the constituent parts of the British colony of the Straits Settlements. It lies off the southern point of the Malay Peninsula (Map: French Indo-China, D 6). The island is 27 miles long and 14 wide; area, 217 square miles. It passed to the East India Company in 1819, and in 1824 the possession was ratified by the payment to the Sultan of Johore of \$60,000 and a life annuity of \$24,000. The island is well watered and has a hot damp climate, the range of temperature being less than 20 degrees. The surface of the island is broken by small hills, varying in altitude from 300 to 400 feet. Vegetation is luxuriant. There is no regular rainy season, but showers are scattered throughout the year; average rainfall (1904-13), 104 inches. The principal products, raised chiefly by the Chinese, are coconuts, gambier, tapioca, cacao, aloes, nutmegs, and a great variety of fruits and vegetables. The flora and fauna resemble those of the Malay Peninsula. The population, consisting largely of Chinese, Malays, and Hindus, in 1901, excluding the military and floating, was 228,555; in 1911, 311,985. These figures include the inhabitants of Singapore's dependencies, Christmas Island, the Keeling Islands, and Labuan Island. Estimated population in 1913, 330,042 (233,674 males, 96,368 females); whites numbered 6138, Eurasians 4985, Asiatics (largely Chinese) 318,919. There is no important town besides the city of Singapore, which includes most of the population.

**SINGAPORE** (from Skt. *Sinhapura*, lion city). The capital of the British colony of the Straits Settlements and the most important commercial emporium of southeastern Asia, situated at the southern end of the island of Singapore (Map: French-Indo China, D 6). The town is well built. Its harbor is commodious and easy of access. For 6 miles along its water front the city is lined with quays and shipyards. In the rear of the city still stands Fort Canning, erected on a hill just outside the original settlement, but now supplemented by modern batteries, which command the harbor. The Governor's palace is an impressive structure in a beautiful park at the top of one of the three hills just outside the city. A most charming spot is the turfed and shaded esplanade, fronting on the outer harbor. In it is erected a monument to Sir Stamford Raffles, the founder of the modern city. The botanical gardens rank among the best in the world. The city hall, the Gothic cathedral of St. Andrew, the Roman Catholic cathedral, and the Raffles Museum and Library are all notable buildings. The greater portion of the trade is in the hands of the Chinese.

Its geographical position at the eastern en-

trance to the Strait of Malacca, about midway between Hongkong and Calcutta, its proximity to the Malay Archipelago, and the policy of absolute free trade have made Singapore the centre of a transshipping trade surpassed in the East only by that of the Chinese ports. The list of imports and exports comprises cotton piece goods, copra, rice, tin, silks, tobacco, spices, petroleum, sugar, coffee, pepper, opium, gambier, coal, fish, rattans, skins, and rubber. The manufactures are not extensive, but include white pepper, tapioca, sago, gambier, vehicles, tools, and furniture, and there are shipbuilding establishments, pineapple canneries, and biscuit factories. The net tonnage entered at the port in 1913 was 8,636,467 and cleared 8,618,486. The resident population of the municipality of Singapore in 1891 was 155,683; in 1900, 193,089. Of the latter number 141,865 were Chinese, 26,230 Malays, 15,646 natives of India, 2748 Europeans and Americans, and 3982 Eurasians. The increase of population is due to immigration; the death rate is greatly in excess of the birth rate, as by far the larger part of the Chinese population is male.

Singapore has its own municipal organization under the supervision of the colonial government. The founding of the city in 1819 was due to the desire of Sir Stamford Raffles, an employee of the East India Company, to establish an outpost to counteract the growth of Dutch influence in this quarter of the globe. Despite opposition on the part of the Dutch and only half-hearted support from the home government, he succeeded in gaining the island for Great Britain, and the continuously rapid growth of the city of Singapore has fully demonstrated his wisdom. After the formal cession of the island to Great Britain in 1824, it was the capital of the consolidated governments of Penang, Singapore, and Malacca, which in 1867 became a crown colony as the Straits Settlements.

**SINGER**, FREDERIC (1847-1923). An American naval officer, born at Karlsruhe, Baden, Germany. His parents brought him to the United States in 1848, and in 1868 he graduated from the United States Naval Academy. Besides serving in other capacities he was a member of the Naval Intelligence Office in 1888-90 and 1893-94 and chief intelligence officer in 1895-96. As executive officer of the cruiser *Raleigh* he participated in the battle of Manila Bay in 1898 and later commanded the captured transport *Manila*. He was promoted to commander in 1899, captain in 1904, and rear admiral in 1906. In 1904-09 Singer was commandant of the United States Naval Station at New Orleans, La. By operation of law he was retired in 1906, but continued in service for some time.

**SINGER**, ISAAC MERRITT (1811-75). An American inventor, born at Oswego, N. Y. He became a mechanic and after a time interested himself in the sewing machine. He constructed an improved machine with a rigid overhanging arm to guide a vertical needle in combination with a shuttle and what was called a wheel feed. With the aid of Edward Clark he established a factory in New York and subsequently became very wealthy. The "Singer Tower" in New York was for some time the highest skyscraper office building.

**SINGER**, ISIDORE (1859- ). An American Jewish editor and author, born at Weisskirchen, Moravia (Austria), and educated at

the universities of Vienna and Berlin. He founded and published the *Allgemeine Oesterreichische Literaturzeitung* (Vienna) in 1884-85, and was founder and editor in chief of *La Parole* (Paris), having gone to France in 1887. He went to Italy in 1891 and to New York in 1895. His most important work was as managing editor of the *Jewish Encyclopedia* (12 vols., 1901-05). He edited also *The World's Debt to the Jew* (15 vols.), *German Classics of the Nineteenth and Twentieth Centuries* (20 vols.), and *International Insurance Encyclopedia* (1910 et seq.). His writings include: *Berlin, Wien, und der Antisemitismus* (1882); *Sollen die Juden Christen werden?* (1884); *Auf dem Grabe meiner Mutter* (1888); *Le prestige de la France en Europe* (1889); *La question juive* (1893); *Anarchie et antisémitisme* (1894); *Der Judenkampf ums Recht* (1902); *Russia at the Bar of the American People* (1904); *Christ or God?* (1908).

**SINGER**, zing'ér, PAUL (1844-1911). A German political agitator, born in Berlin of Jewish parents. Engaged in business from 1858, he established a cloak manufactory in Berlin in 1860, joined the Social Democrats in 1870, and was elected to the Reichstag in 1884. He became, next to Bebel, the principal leader of the party.

**SINGER**, SIMEON (1846-1906). An English rabbi, born in London and educated at the Jews' College, of which he was later headmaster for a brief period. In 1867 he became minister of the Borough Synagogue and in 1878 of the New West End Synagogue. In religious matters Dr. Singer aimed to reconcile the views of the Conservative and Liberal Jews and was instrumental in introducing a few moderate reforms in the Hebrew service. In 1892 he organized the first conference of Jewish preachers in England. He was also actively interested in the welfare of Jews on the Continent, especially in Russia. A preacher of ability, he was one of the first to introduce regular sermons for children. He was joint editor of *Talmudic Fragments in the Bodleian Library* (1896) and edited a widely used edition of the *Authorized Daily Prayer Book*, with English translation. Consult I. Abraham, *Literary Remains of the Rev. Simeon Singer* (3 vols., London, 1908), with memoir.

**SINGH**, SIR PERTAB. See PERTAB SINGH.

**SINGHARA** (sing-há'rā) **NUT**. See TRAPA.

**SINGING** (from *sing*, AS. *singan*, to sing, Goth. *siggan*, to sing, read). The production of sustained musical tones by the voice. The physical apparatus consists of the larynx (containing the vocal cords), the lungs, and the muscles of the chest and diaphragm; also, as accessories, the cavity of the mouth, the hard palate, and the nasal chambers, all of which aid in modifying the character of the tones produced, and serve as sounding boards to increase their power. The tones of the human voice, either in speaking or singing, are formed by the vibration of the vocal cords. These are two parallel elastic membranous bands situated in the larynx, which thus resembles a reed instrument, like an oboe. The blast of the air column driven from the lungs sets these bands vibrating. By the act of volition they are set

to receive the impact of the column of air in such a way as to produce tone. By closing or opening so as to vibrate at different portions of their length, they give tones of different pitch.

The lungs supply the air and are operated by the muscles before mentioned. The diaphragm, the use of which is often neglected by singers, is of great service in giving power and control to the breathing, which is of the first importance in singing. Clavicular or upper-chest breathing is regarded as the least satisfactory method and is not employed by any great singer. The abdominal method, advocated by Mandl in 1855 and introduced into the Paris Conservatory and among Italian teachers, consists in keeping the chest as quiet as possible and forcing the diaphragm down and the anterior wall of the abdomen out in inspiration. The leading singers of to-day advocate the use of all the external intercostal muscles and the drawing in of the anterior wall of the abdomen in inspiration. They hold that this method sets the diaphragm firmly, gives greater mastery, and enables the singer better to graduate the power of the air column.

The compass of the human voice extends from C to C<sup>2</sup>. Some exceptional voices have exceeded this range. No one voice has this compass, of course, for the average human voice has an extent of about 12 tones, while trained singers usually have two octaves. Some have had more than three. Five general divisions of singing voices are recognized: two women's, soprano and contralto, and three men's, tenor, barytone, and bass. These are here named in the order of their pitch from the highest to the lowest. Music for sopranos, contraltos, and tenors is written on the treble clef, for the other voices on the bass clef. The tenor voice, however, produces tones an octave lower than those written.

The pitch of voices is the result of the length of the vocal cords. These cords are shorter in women than in men; hence the former have higher voices. The longest vocal cords are those of a deep bass. Pitch, however, is not the only trait which determines the title of a voice, for tone quality must be considered. Tenor and barytone voices of exactly the same range exist, but the character of the tones is different, voice quality being modified by resonance and muscle action.

Each voice is divided into several "registers," a term borrowed from the organ. It means a succession of sounds having similar character or produced by the same mechanism. Authorities differ as to the number of registers which exist in the human voice, but the majority follow Manuel García, inventor of the laryngoscope and a famous singing teacher. He holds that there are three registers, which he calls chest, falsetto, and head. Some writers have named as many as five registers, and others find that the voices of men and women differ in their divisions of this kind. The mechanical action of the larynx and certain of the resonating apparatus changes as the singer ascends the scale, and the tendency is towards modifications in the quality of the tones, so that the different registers are dissimilar in character. Between the registers, especially between the highest and the next lower, there are audible breaks, and usually the tones on either side of this are weak and uncertain. One of the most important labors of the teacher is the equalization of the registers,

so that the quality of tone may be homogeneous throughout the scale. This is accomplished by cultivated methods of tone formation, in which the air column is voluntarily directed towards certain resonators.

The training of the voice for singing is a slow and painstaking process. Most of the training is directed towards securing correct tone formation (or tone placing, as it is usually called). Upon the correctness of the placing depend the strength, carrying power, smoothness, and beauty of the tone. The acquirement of a perfect method of tone formation is the only road to the strengthening of comparatively weak vocal organs. No teacher can make a big voice out of a little one. Nevertheless it is undeniable that the lungs can be developed by the practice of deep breathing exercises, and the diaphragm and other expulsive muscles developed by systematic use. So, too, the vocal cords and the muscles and ligaments of the larynx can be made stronger by training, but the limit of development is not large. The principal efforts of wise teachers, therefore, are directed to giving their pupils a firm, round, pure tone, which will carry well; the general management of the breath is quite important. Proper employment of the resonating chambers is also necessary.

Every tone ought to sound to the hearer as if it were sung just behind the teeth of the singer. By keeping the tongue depressed, by allowing a part of the air-blast free passage through the nasal chambers, and by bringing the main body of it to bear upon the roof of the mouth at the proper point, tones may be made to sound as if formed well forward and may be actually projected into the auditorium more sonorously than when improperly made. The requirements of good tone are that it shall be pure, i.e., that all the breath must be turned into tone and none allowed to escape in a hissing sound; that it shall be clear, i.e., shall never sound as if there were some obstacle in the singer's mouth; and that it shall be free, i.e., not muffled or squeezed down in the throat. A correct "attack" is the most important essential of good tone production. The breath must strike the vocal cords at precisely the instant when they form the tone, neither before nor after. Weak voices are made stronger and good voices better by the mastery of the art of tone formation.

To this must be added the requisites of expression. These are a perfect legato, command of the *messa di voce*, perfect vocalization of the vowels, and perfect articulation of the consonants. *Legato* means "bound," and in singing it is the passage of the voice smoothly and connectedly from one note to the next in succession. Without a command of the legato no flowing melody can be sung properly. Variety is sometimes added to a melody by the use of the portamento, a sliding or carrying of the voice through the infinitesimal degrees of pitch lying between two notes. This is opposed to the legato and is often so much abused as to preclude all possibility of singing in tune. The legato is the foundation of all good vocal style, and it was in this that the famous singers of the eighteenth century surpassed their successors. The *messa di voce* is the swelling of a tone from pianissimo to its full power and then diminishing it to the starting point. This is accomplished entirely by control of the breath, though some mistaken singers try to reach the result by straining the muscles of their throats. The *messa di voce* is

of the greatest importance in expression, as it enables the singer to vitalize his song with minute dynamic gradations of tone, similar to those employed in speech.

The vowels present many difficulties to the singer, as the position of the throat and tongue in sounding some of them, especially at full voice, is inimical to good tone production. Much practice is necessary to give the effect of the vowel sounds to an audience while preserving the essentials of good tone. The articulation of the consonants, which is greatly neglected by English singers and greatly exaggerated by the Wagnerian school of German declaimers, is absolutely necessary to intelligible delivery of the text. The problem to be solved is how to enunciate clearly consonants which naturally cut off the flow of vowel sounds, on which alone tones can be made, and yet not interrupt the fluency of a pure legato style. The problem is solved by learning how to separate the articulative apparatus from the sound-producing mechanism and to operate the two independently without letting them disturb each other. This, like all the rest of singing, requires long and patient self-study under the guidance of a skilled teacher.

**SINGLE CARRICK BEND.** See KNOTTING AND SPLICING.

**SINGLE TAX.** A tax designed to meet all or the principal needs of government, levied upon a single object of taxation. The single tax on the rent of land was introduced into general economic discussion about the middle of the eighteenth century by the Physiocrats (q.v.) and was popularized by Henry George (q.v.), particularly in his *Progress and Poverty* (1879) and his speeches in the New York mayoralty campaigns of 1886 and 1897. George advocated the abolition of all taxes upon industry and the products of industry, and the

taking, by taxation upon land values, irrespective of improvements, of the annual rental value of all those various forms of natural opportunities embraced under the general term "land."

Three classes of arguments are adduced in support of the appropriation by the state of economic rent: 1. The ethical argument rests upon the theory of natural rights. Man, it is asserted, has an absolute, inalienable right to life, to equality of opportunity, and to private property. By virtue of the right to live he may claim access to those natural opportunities—land—which are necessary for the maintenance of life. This is an individual right. But land differs in fertility and value. By virtue of the right of equality, then, men have a joint claim to the difference between the annual values of the worst and the better lands in cultivation; this differential value is economic rent, and it belongs to the community. Finally, man has an absolute and inalienable right to the property created by his own exertions, and this property cannot be rightfully taken from him for any cause whatsoever. Other forms of taxation than land taxes are therefore inequitable. Single taxers of course made frequent use of the familiar argument that economic rent is created by the community, not by the labor of the individual owner, and that in consequence it cannot in justice be appropriated by the owner.

2. The second general argument rests upon the economic theory of distribution. With some modifications George followed the Ricardian theory of economic progress. (See *POLITICAL ECONOMY, Classical School*.) With the increase of population, George held, mankind is forced to resort to poorer and poorer lands in order to produce the necessary food supply. But as the margin of cultivation is thus forced down, economic rent—which is the difference between the productivity of the worst and the better lands in cultivation—increases and wages decrease, because wages in general are fixed by the income which can be earned by the occupiers and tillers of the free land which pays no rent. The share of capital in the product of industry, George also maintained, would follow the same course as wages, capital being in all essential respects simply labor impressed or congealed into matter. Wages and interest therefore rise and fall together, varying inversely as rent. Not only does rent increase with the increase in population, but every invention involves a further demand upon the soil for raw produce and thus increases rent. Everything that lowers interest depresses wages and exalts rent; every new increment of capital, being a demand for land, has the same effect; the accession of every new laborer acts similarly; time that increases the population, science that stimulates invention, frugality that multiplies capital, in short material *Progress* itself, under the régime of the private ownership of land, is synonymous with *Poverty*. Hence the title of George's principal work.

3. The third class George designated as the arguments from expediency. Some of the most important may be briefly summarized as follows: First, the appropriation of economic rent would yield sufficient revenue to defray all the legitimate expenditures of government. On the other hand the abolition of all other taxes would dispose of a large army of tax gatherers, make the government simpler, and hence purer and less expensive. Secondly, it would enormously in-

crease the productivity of wealth by removing the taxes upon capital, production, and consumption which now repress or discourage industry and by forcing into use and cultivation the lands now held idle for speculative purposes. There could be no speculative holding of land for a rise in value if this value, when it accrued, would be appropriated by the state. Finally, the tax on rent could not be shifted, while it would preserve private property in everything except land and prevent Socialism or the public management and operation of land. It is important to note that single taxers in the United States are in general vigorously opposed both to Socialism and land nationalization.

Economists have opposed with practical unanimity the extreme theory upon which the single-tax reform is based, involving, as is admitted, the confiscation of economic rent without compensation, and the dual proposition that the failure to appropriate all land values and any taxation of other values are both species of robbery. Some of the objections most frequently urged against the single tax may be summarized as follows: 1. That land is similar to all other forms of wealth in respect to the fact that it consists of indestructible matter adapted by human exertions to satisfy human wants, and that in consequence George's distinction between property in land and other forms of property is invalid. 2. That private property in land is permitted and encouraged because it conduces to the greatest good of the greatest number and supplies a fund of wealth from which the state can easily derive all necessary revenues by the ordinary methods of taxation; that, acting in this belief, the United States has encouraged innocent parties to invest in lands, or to settle the public domain, clear it, till it, and by their labor and residence invest it with a value; that under such circumstances arbitrarily to confiscate the values so created would be fundamentally inexpedient and intolerably unjust. 3. That the single tax would be inelastic, yielding too much revenue in some districts and too little in others—a dangerous surplus in times of peace, perhaps, and an equally dangerous deficit in times of war and public emergency. 4. That the error of George's theory of distribution is shown by the facts, *inter alia*, that in many communities during the last 50 years rents have fallen, not risen, while in the same period wages have risen with practical universality. 5. That the single tax would prevent the utilization of the taxing power for sumptuary purposes (e.g., taxation of intoxicating liquors), for the protection of home industry, and for the improvement of the present distribution of wealth (e.g., a progressive income tax). 6. That it is difficult theoretically to determine the value of land irrespective of the improvements upon it, that in practice the assessment of land is notoriously inexact, and that the single tax would intensify the injustice from this unequal assessment. 7. Finally, it is denied that the single tax would appreciably facilitate the accessibility to the soil, help the farmer, reduce overcrowding in cities, for the reasons among others that the tenant class would be in no better position than at present, merely paying rent to the state instead of the private landlord, while the large number of small landowners would not only be expropriated, but would in the future have to pay large rentals to the state.

While economists have with practical unanimity rejected the proposition to tax all economic rent and abolish all other taxes, a large number have advocated measures looking to the gradual appropriation by the state either of all the future unearned increment of land or of a larger share of this future unearned increment than is taken at the present time in taxes. This idea has met with particular favor in regard to urban land. John Stuart Mill advocated the appropriation of the future unearned increment of land. Prof. Adolph Wagner, the distinguished German economist, advocates private ownership of agricultural land, but favors public ownership of urban land, which would, of course, bring into the public treasury all future increment in land values. The exemption of improvements for a period of years, especially buildings, has met with favor and, indeed, has been adopted in many European countries. This, so far as it goes, is in harmony with the idea of the single tax. In his famous budget of 1909 Mr. Lloyd-George, Chancellor of the English Exchequer, provided a tax of 20 per cent on the unearned increment in land values. Improvements of every sort were exempted. There were included additional taxes of  $\frac{1}{2}$ d. per pound on the value of wholly undeveloped land; and of 5 per cent on the rental value of mineral rights. Quite in harmony with single-tax aims also was Lloyd-George's land-reform scheme put forth in October, 1913. This aimed greatly to reduce the power of land monopoly by bringing all questions of the control and use of land under a proposed Ministry of Lands. The war prevented the development of this proposal. See LLOYD-GEORGE.

The single taxers are now endeavoring to secure, first, a separation in the assessments of property, of land values, and the value of improvements on land; and, second, what they call home rule in taxation, or the authorization of local political units to place a tax upon land values and to free personal property from taxation, in case they desire to do so.

**SIN'GLETON, ESTHER** (?- ). An American author, born in Baltimore, Md. After 1887 she lived in New York City. For six

years she was employed on the editorial staffs of various encyclopædias. Among her many publications are: *Turrets, Towers, and Temples* (1898); *The Furniture of our Forefathers* (2 vols., 1900); *Famous Paintings* (1902); *Social New York under the Georges* (1902); *Historic Buildings of America* (1906); *Dutch and Flemish Furniture* (1907); *A Guide to the Modern Operas* (1909); *Dutch New York* (1909); *Modern Pictures* (1911); *Furniture* (1911); *How to Visit the English Cathedrals* (1912); *A Daughter of the Revolution* (1915), a novel.

**SINGPHOS**, sing'fōz. A people of northern Burma of doubtful racial affinities. They were formerly called Cacoebes and, by the Burmese, Kakhyens. Consult Dalton, *Ethnology of Bengal* (Calcutta, 1872).

**SING SING**. The former name of Ossining (q.v.).

**SINGSING**, sing'sing' (African name). An antelope (*Cobus defassa*) of western and Central Africa, which differs from the waterbuck (q.v.) in its smaller size, the fineness and softness of its hair, a continuous whitish patch on the buttocks, but none on the throat. See authorities cited under ANTELOPE, and Plate of ANTELOPES.

**SINGSPIEL**, zing'shpēl (Ger., song play). See MUSIC, HISTORY OF, XVII.

**SINGULARITIES**. See CURVE.

**SINGUL'TUS**. See HICCUGH.

**SINIBALDI**, sē'nē-bāl'dē, GUITTONCINO. See CINO DA PISTOJA.

**SINIGAGLIA**, sē nē-gū'lyā. A city of Italy. See SENIGALLIA.

**SINIGAGLIA**, LEONE (1868- ). An Italian composer, born at Turin. He received his first musical instruction from Bolzoni in his native town. Then he went to Vienna, where he studied systematically under Eusebius Mandyczewsky and profited greatly from his association with Dvořák and Goldmark. He is one of the few modern Italian composers to win fame in the field of instrumental music. In several of his works he employs Piedmontese folk melodies. His talent was first recognized in Germany, where his beautiful concerto for violin in A, performed by Arrigo Serato during his tour of 1901, attracted much attention. His compositions include an overture, *Le Baruffe Chiozzotte*; *Danze Piemontesi*; *Rapsodia Piemontese*; variations on a theme of Brahms; a *Romanza* for violin and orchestra; a string quartet; numerous pieces for violin, cello, and horn; choruses; songs.

**SI'NIM**. A land mentioned in Isa. xlix. 12. The oldest Greek version rendered "the land of the Persians"; Jerome and the Aramaic Targum translated "the South Land." Arias Montanus was the first to suggest China and has had many followers, but it has been shown, particularly by Terrien de Lacouperie, that this is impossible. As the territories of Tsin and Thien on the Hoang-ho in the north cannot have been intended, the name Tsin for China can only be the designation derived from the Tsin dynasty, which came upon the throne in 255 B.C. This was indeed rendered Sin by Ptolemy (vii, 3), but Syrians and Arabs always transcribe it as Zin, and that would have been the probable pronunciation among the Hebrews. Nor is Shina at the foot of Hindu Kush, proposed by De Lacouperie, more probable. Duhm has suggested the Phœnician Sinim (Gen. x. 17), but the connection is more favorable to a location in the south. Saadia thought of Sin (Pelusium

in Egypt), and he has been followed by Bochart and Ewald. Dillmann thought of the wilderness of Sin (Ex. xvi. 1) and the mountain of Sinai. J. D. Michaelis and Doederlein first proposed, and Klostermann, Cheyne, and Marti have adopted, the explanation of "the land of Sinim" as southern Egypt from Syene (Assuan; q.v.). Cheyne reads Sewanim. The recent discovery of Aramaic papyri from Elephantine has rendered it practically certain that there were Jewish colonies at the southern end of Egypt when this passage was written. See ELEPHANTINE PAPYRI. Consult Terrien de Lacouperie, *Babylonian and Oriental Record* (London, 1886), and the commentaries on Isaiah by Dillmann (Leipzig, 1890), Duhm (Göttingen, 1892), Cheyne (New York, 1898), Marti (Tübingen, 1900).

**SINISTRALITY.** The condition of being left-handed. Right-handedness is the general condition of about 91-98 per cent of humans, the preference for the right side extending to the foot, and persons walking blindfold show an inclination some to turn to the right, but not all. Ambidexterity is the state of having equal abilities with both hands. Many ambidextrous persons were born left-handed, having trained their right hands to be as skillful as the left. Right-handedness seems to be correlative with a greater development of the left hemisphere of the brain. See HAND.

Consult: Daniel Wilson, *The Right Hand: Left-Handedness* (London, 1891); J. M. Baldwin, *Mental Development in the Child and the Race* (3d rev. ed., New York, 1906); for symbolism of right and left, Silberer, *Probleme der Mystik und ihrer Symbolik* (Vienna, 1914).

**SINITIC.** A term used by certain ethnologists to designate the group of peoples made up of the Chinese proper, the Tibetans, and the Indo-Chinese, all of whose languages have peculiar features and such affinities that they all point to one ancestral stock.

**SINK HOLES.** See CAVE.

**SINKING FUND.** See FINANCE.

**SINKIUSE**, sîn'kî-ûs'. See COLUMBIA INDIANS.

**SIN'NETT**, ALFRED PERCY (1840- ). An English journalist and theosophist, born in London. He was educated at the London University School. In 1859 he became assistant subeditor of the *Globe* and subsequently leader writer on other London newspapers. In 1865 he went out to Hongkong as editor of the *Daily Press*. Returning to England in 1868, he served on the staff of the *Standard* till 1872, when he became editor of the *Pioneer* of Allahabad in India. In 1879 he joined the Theosophical Society of London, of which he afterward became vice president. His occult works have had extensive circulation. They include: *The Occult World* (1881); *Esoteric Buddhism* (1883); *Life of Madame Blavatsky* (1886); *The Growth of the Soul* (1896); two occult romances, *Karma* (1885) and *United* (1886). He made numerous contributions to the published transactions of the London Lodge of the Theosophical Society. In 1904 he fathered a new monthly, *Broad Views*, discontinued in 1907.

**SINN FEIN.** See IRELAND.

**SINN FEIN**, shîn-fân. See UNITED KINGDOM.

**SINOPE**, sî-nô'pê. A town in the Vilayet of Kastamuni, Asiatic Turkey, on the south shore of the Black Sea, 185 miles northeast of Angora

(Map: Turkey in Asia, C 2). The Bay of Sinope affords the finest anchorage for ships along the north coast of Asiatic Turkey. The town exports timber, dried fruits, skins, and silk. Pop., 7000. The ancient city of Sinope was founded by a colony of Milesian Greeks in the eighth century B.C. For 200 years after the Peloponnesian War it was almost the mistress of the Euxine. Of its former splendor there remain only the castle of Mithridates and a few Roman substructures. The Bay of Sinope was the scene of a naval engagement Nov. 30, 1853, in which a Turkish squadron was destroyed by the Russian fleet. (See CRIMEAN WAR.) Consult D. M. Robinson, *Ancient Sinope* (Baltimore, 1906).

**SINTRAM** (zîn'trâm) AND HIS COMPANIONS. A German romance by Fouqué, published in 1814 as the fourth part of the *Jahreszeiten*, of which *Undine* formed the first.

**SINUBE**, sê-nôob'. See SINOPE.

**SINUS** (Lat., bend, hollow). The cells or cavities contained in certain bones, as the frontal, ethmoid, sphenoid, and superior maxillary, are called sinuses. The frontal sinuses are two irregular cavities extending upward and outward, from their openings on each side of the nasal spine, between the inner and outer layers of the skull, and separated from one another by a thin bony septum. They give rise to the prominences above the root of the nose called the nasal eminences. They are not fully developed till after puberty and vary considerably in size, being usually larger in men than in women and young persons, in consequence of the greater prominence of the superciliary ridges in the former. They communicate on each side with the upper part of the nostril by a funnel-shaped opening, which transmits a prolongation of mucous membrane to line their interior. The sphenoidal sinuses are two irregular cavities, formed, after the period of childhood, in the body of the sphenoid bone. They communicate with the upper and posterior part of the nose, from which they receive a layer of mucous membrane. Like the frontal sinuses, they serve to lessen the weight of the skull and to add to the resonance of the voice. The ethmoid sinuses or cells lie in the lateral masses of the ethmoid bone. They open into the cavities of the nose. The superior maxillary sinus, commonly known as the antrum of Highmore (after the anatomist who first accurately described it), is the largest of the facial sinuses. Its uses are the same as those of the others, and like them it communicates with the nasal cavities. The sinuses of the dura mater are quite distinct from the above-described bony sinuses; they are irregular channels for the transmission of venous blood. In surgery the term "sinus" is nearly equivalent to fistula (q.v.).

**SION**, sê'ôn' (Ger. *Sitten*). The capital of the Canton of Valais, Switzerland, situated on the Sionne, which flows through the town in an artificial channel, not far from its junction with the Rhone and 17 miles east of Saint-Maurice (Map: Switzerland, B 2). Ruins of the thirteenth-century castle of Tourbillon are to the north and the castle of Valeria, the former residence of the canons, to the south. The town proper contains the fifteenth-century cathedral, the thirteenth-century church of St. Catharine, and the Gothic town hall. Pop., 1900, 6095; 1910, 6251.

**SIOUAN** (sîo'ân) STOCK. One of the most

widely extended and important linguistic groups of North America, occupying within the recent historic period the greater portion of the Plains area, but in earlier times holding also the coast and midland region of Virginia and the Carolinas, with outlying tribes upon the Gulf coast. According to language the tribes of this stock fall into the following subdivisions: 1. Sioux (Dakota)—Assiniboin group. (For minor divisions, see SIoux.) 2. Dhegiha group: the Omaha, Ponca, Quapaw, Osage, and Kansa. 3. Chiwere group: the Iowa, Oto, and Missouri. 4. Hidatsa—Crow group: the Hidatsa (Minutari) and Crow (Absaroka). 5. Mandan. 6. Winnebago. 7. Biloxi group: the Biloxi and Ofo. 8. Eastern Sioux: the Monacan, Catawba, Tutelo, Saponi, Occaneechi, Manahoac, and numerous extinct divisions.

The first six of the above occupied various parts of the Missouri and upper Mississippi river basins, the seventh the Gulf coast of the State of Mississippi, and the last parts of Virginia, North and South Carolina. These geographical divisions differed greatly in culture, as did also the first six tribal groups enumerated above; hence, for a cultural characterization the reader must turn to the special articles on the various tribes. The time and manner of the distribution of these tribes cannot be determined for want of positive data, but McGee believed the assumption of an Atlantic coast origin was justified by indirect and inferential evidence. Consult: Riggs, *Grammar and Dictionary of the Dakota Language* (Washington, 1852); J. C. Pilling, "Bibliography of the Siouan Languages," in *Bureau of American Ethnology, Bulletin No. 5* (ib., 1887); J. O. Dorsey, *The Cegiha Language* (ib., 1890); James Mooney, "The Siouan Tribes of the East," in *Bureau of American Ethnology, Bulletin No. 22* (ib., 1895); McGee, *The Siouan Indians* (ib., 1897); Franz Boas, *Handbook of American Indian Languages* (ib., 1911).

**SIoux**, **soo**, or **DAKOTA**. One of the most important Indian tribes north of Mexico, being the largest in the United States with the possible exception of the Ojibwa. Their popular name is supposed to be an abbreviation from Nadowesiwug (corrupted by the French to Nadaouesioux), "little snakes," i.e., "enemies," their ancient name among the Ojibwa, as distinguished from the Nadowe or Iroquois, the "snakes" proper. They are now more usually called Buanag, "enemies," by the Ojibwa, whence Asini-buanag, "Stone Sioux" of Assiniboin. The Sioux call themselves Lakota, Nakota, or Dakota, according to the respective dialect, the word meaning "allies."

Their historic habitat was in northwestern Wisconsin and eastern Minnesota around the end of Lake Superior and the headwaters of the Mississippi; thence southwestward through North and South Dakota, with the Assiniboin to the north and westward through Manitoba and Saskatchewan. In the early part of the French occupation of Canada the eastern wing of the Dakota was forced back from the lakes by the Ojibwa, but aside from this movement the various divisions of the Dakota occupied the same territory from the time of their discovery until placed upon reservations by the United States government. In 1815 the eastern bands made their first treaties of friendship with the government after having sided with the English in the War of 1812. By the general

treaty made at Prairie du Chien in 1825 the hereditary war between the Sioux and the Ojibwa was ended by the adjustment of tribal boundaries and the Sioux confirmed in possession of an immense territory from the east bank of the Mississippi almost to the Rocky Mountains and from near Devils Lake southward to about the present Sioux City, including nearly half of Minnesota, two-thirds of the Dakotas, and large portions of Wisconsin, Iowa, Missouri, and Wyoming. The headwaters of the Mississippi were left to the Ojibwa by right of former conquest and existing occupancy. In 1835 missions were established among the eastern (Santee) bands by the American Board, which started schools and printed books in the language. In 1837 the Sioux sold all their claims east of the Mississippi. In 1851 they sold the greater part of Minnesota, but dissatisfaction at the delay of the government in fulfilling the terms of the treaty led to a massacre of settlers at Spirit Lake on the Minnesota-Iowa border in 1857, followed a few years later by a second rising inaugurated by the terrible Minnesota Massacre in 1862, in which nearly 1000 settlers lost their lives. The outbreak was put down by General Sibley, who crushed the Indians and hung 39 of the leaders from the same scaffold. The result was the expulsion of the Sioux from Minnesota. From this time until 1868 the western bands, together with other Plains tribes and under the leadership of Red Cloud and others, were almost constantly at war with the whites. A principal event of this was the massacre of Fetterman's entire command of about 100 men near Fort Kearney, Neb., in 1866. In 1868 a treaty of peace was made which remained unbroken until the invasion of the Black Hills by the miners, consequent upon the discovery of gold, led to another war in 1876-77, the principal event of which was the massacre of General Custer's entire command of nearly 300 regular troops, June 25, 1876. (See CUSTER, GEORGE ARMSTRONG.) Sitting Bull (q.v.), the leader of the irreconcilables, escaped to Canada with several thousand followers, but returned in 1881 on promise of amnesty. After being held two years as a prisoner of war Sitting Bull again took up his residence at Standing Rock Agency, where he remained until his death. In 1889 another treaty was made by which the Great Sioux Reservation, embracing all of South Dakota west of the Missouri, was reduced by about one-half and the remainder cut up into five distinct smaller reservations. The opposition of a powerful minority to this sale, coupled with dissatisfaction at treaty grievances and the excitement aroused by the reported advent of an Indian messiah in the West, led to another outbreak in the winter of 1890-91. Leading events were the killing of Sitting Bull, Dec. 15, 1890, and the Wounded Knee Massacre, Dec. 29, 1890, by which about 300 Indians lost their lives. The outbreak was soon afterward successfully brought to a close by General Miles.

These struggles brought to notice more distinguished chiefs than any other Indian nation. The best known in addition to the above are Tohami, Short Bull, Kicking Bear, American Horse, Crow King, Spotted Tail, Crazy Horse, Gall, Young Man Afraid of his Horses, Rain in the Face, Waneta, Little Crow, Wapasha, and Wamditanka. The Dakota have seven principal divisions or council fires, viz., Mde-wakanton-

wan, "spirit lake village" (Mde-wakanton); Waqpekuté, "leaf shooters"; Waqpetonwan, "leaf village" (Wahpeton); Sisitonwan, "swamp village" (Sisseton); Ihanktonwan, "end village" (Yankton); Ihanktonwanna, "upper end village" (Yanktonais); Titonwan, "prairie village" (Teton). The first four are known collectively as Isanati or Santee. The Yankton and Yanktonais resided in that part of Dakota east of the Missouri. The Teton, constituting two-thirds of the whole nation, lived west of the Missouri upon the buffalo plains. The Teton are further subdivided into Ogalala (at Pine Ridge), Brulé (at Rosebud and Lower Brulé agencies), Hunkpapa (at Standing Rock Agency), Two Kettle, Sans Arc, Miniconjou, and Sihasapa (Blackfoot Sioux). There are three principal dialects, Teton, Yankton, and Santee, distinguished chiefly by differences in the use of *l*, *n*, and *d*, as exemplified in the various forms of the tribal name. (See above.) The languages have been much cultivated, an alphabet having been adapted to it by the missionaries, so that it now has a considerable literature, including newspapers, while nearly all the men can read and write it. It is vocalic, euphonious, but strongly nasal.

The sedentary and agricultural eastern Santee-Dakota were commonly rated as inferior to their western brethren, who were typical nomad warriors and hunters, the lords of the Plains, before whom no other tribe could stand. A great ceremony was their annual sun dance (q.v.), held under the direction of the warrior societies and usually accompanied by voluntary self-torture. The Santee have been civilized and Christianized for a generation. The western bands are only now beginning to accept the white man's road, but their high character and intelligence are bringing them rapidly to the front. According to the census of 1910 the total for all divisions of the Dakota is 22,780, not including some 600 refugees in Canada. See SIOUAN STOCK, and Colored Plate of AMERICAN INDIANS under INDIANS.

**SIOUX CITY.** A city and the county seat of Woodbury Co., Iowa, 100 miles north by west of Omaha, Neb., on the Missouri River, at the junction of the Big Sioux and the Floyd (Map: Iowa, A 2). The railroads that enter the city are the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Chicago, St. Paul, Minneapolis, and Omaha, the Sioux City Terminal, the Illinois Central, the Great Northern, and the Chicago, Burlington, and Quincy. It is the seat of Morningside College (Methodist Episcopal), opened in 1890, and of Trinity College (Roman Catholic), founded in 1912. Other noteworthy features include the public library, containing 48,000 volumes, the high-school building, costing \$500,000, the new courthouse, costing \$700,000, St. Joseph's, Samaritan, German Lutheran, and St. Vincent hospitals, the tuberculosis sanitarium, auditorium, and the Wall Street and Helping Hand missions. The 1914 government census of manufactures showed an invested capital of \$22,610,000 and a production valued at \$49,452,000. The volume of its jobbing business in 1915 amounted to about \$60,000,000. There are large packing houses, flour mills, sash and door factories, brick and tile works, and manufactories of gas engines, metal tanks, candy, crackers, saddlery and harness, etc.; and the Chicago, Milwaukee, and St. Paul and the Chicago, St.

Paul, Minneapolis, and Omaha railways have extensive machine and repair shops. The city spent, in the fiscal year 1914-15, \$89,000 for fire department, \$55,000 for police department, \$157,000 for water works, \$96,000 for streets, \$34,000 for municipal lighting, and \$300,000 for schools. The water works are owned by the municipality. The city has adopted the commission form of government. Settled as a trading station in 1849, Sioux City was chartered as a city in 1857. During its early years it was an important military post and was the place where the various Black Hills expeditions were fitted out. Pop., 1900, 33,111; 1910, 47,828; 1915 (State census), 61,787; 1920, 71,227.

**SIOUX FALLS.** A city and the county seat of Minnehaha Co., S. Dak., about 186 miles (direct) southeast of Pierre, the State capital, on the big Sioux River, here spanned by four bridges, and on the Chicago, Milwaukee, and St. Paul, the Great Northern, the Illinois Central, the Chicago and Northwestern, the Chicago, Rock Island, and Pacific, and the South Dakota Central railroads (Map: South Dakota, H 4). It is the business centre of the State. Here are the Sioux Falls College (Baptist), a Lutheran Normal School, All Saints School, and the State School for Deaf Mutes. Other prominent features are the State Penitentiary, Children's Home, the United States government building, the courthouse, and the public library. Sioux Falls is chiefly important as the centre of extensive stone-quarrying, manufacturing, and jobbing interests. The leading manufactures are biscuits and crackers, beer, boilers, brick, brooms, candy, cigars, foundry products, mattresses, paper boxes, barrows, soap, metal culverts, creamery products, flour, grain bins, etc. Job printing and meat packing are also important. It has adopted the commission form of government. Pop., 1900, 10,266; 1910, 14,094; 1915 (State census), 21,160; 1920, 25,176.

**SIPEIRA**, sê-pâ'râ, or SÍPIRI. See GREEN-HEART.

**SIPHON** (Lat. *sipho*, from Gk. σίφη, *síphē*, pipe, tube; perhaps connected with Lat. *tibia*, pipe, shin bone). A tube in the form of an inverted U, used to convey a liquid from a higher to a lower level over an intermediate point higher than either. One arm of the tube, *A*, is placed in the liquid, while the other, *B*, which must extend below the level of the liquid, is outside and forms the outlet. If now the air is exhausted from the tube, the liquid will rise from the pressure of the atmosphere and will fill the tube and flow through the lower end, unless the bend of the tube is more than 33 feet above the surface of water or a liquid of equal density. The reason can readily be seen, since a column of water 33 feet in height weighs as much as a column of atmosphere of equal cross section, and consequently the effective pressure would be downward instead of up, that of the liquid being greater than that of the atmosphere. The lower the outside tube below the surface of the liquid the more rapid will be the flow, which will continue until the level of the liquid either sinks below that of the outlet or air finds its way into the tube. In large

siphons, such as are sometimes used in connection with municipal water supplies, it is customary to install at the highest point a device for removing the air which, if allowed to accumulate, will stop the flow.

Inverted siphons are occasionally used in place of an aqueduct to carry water across a valley.

**SIPHONALES.** See ALGÆ; CHLOROPHYCEÆ.

**SIPHONOPHORA** (Neo-Lat. nom. pl., from Gk. σιφωνοφόρος, *siphonophoros*, carrying tubes, from σίφων, *siphōn*, pipe, tube + φέρειν, *pherein*, to carry). An order of the coelenterate class Hydrozoa. They are the so-called compound hydroids, living in free-swimming colonies, consisting of polymorphic individuals or zooids, i.e., organs with a strongly marked individuality, but all more or less dependent on one another and originating from a common cœnosarcial tube. In *Physalia* there are four kinds of zooids, i.e., (1) locomotive and (2) reproductive, with (3) barren medusa buds (in which the proboscis is wanting) which, by their contractions and dilatations, impel the free-swimming animal through the water; in addition there are (4) the feeders, a set of digestive tubes which nourish the entire colony. The upper end of the cœnosarcial tube is usually closed by a float, very large in *Physalia*. This float is filled with air, acts as a hydrostatic apparatus, and enables the colony to maintain a vertical position in the water. See PORTUGUESE MAN-OF-WAR; also Colored Plate of MEDUSÆ AND SIPHONOPHORA.

**SIPHONOSTELE** (from Gk. σίπων, *siphōn*, tube + στήλη, *stēlē*, post). The central woody cylinder of stems which includes the pith region. It is in contrast with protostele, in which the woody cylinder is solid, including no pith.

**SIPO**, sĕ'pō. See WOOD SNAKE.

**SIPONTUM.** See MANFREDONIA.

**SIPPAR**, sĭp'pär'. An ancient city in Babylonia. It is already mentioned in the time of Lugalzaggisi of Uruk and Sargon II of Agade and was the first residence of the dynasty to which Hammurapi belonged. As a centre of the worship of Babbar or Shamash, the sun god, it enjoyed a high reputation and continued to flourish, not only in the days of the Chaldean kings and Nabunaid, but also during the Achæmenian rulers. The ruins were discovered in 1881 by Hormuzd Rassam, who conducted excavations there for more than a year. Of the 300 rooms on the temple hill, 130 were excavated by Rassam, and almost 60,000 inscribed tablets were found. Among them the so-called cult tablet of Sippar possesses peculiar interest. It was here that Nabunaid, after prolonged labors, found the foundation stone of Naram Sin, the son of Sargon II, who is said to have reigned 3200 years before his time. Victor Scheil conducted excavations in 1893. There was a twin city, probably on the eastern bank of the Euphrates, called Sippar of Anunit, or Agade (see ACCAD), which has not yet been identified, and it still remains most probable that the double city was referred to by the Jews as Sepharvaim (q.v.). In the time of Nebuchadnezzar and Nabunaid another city grew up on the Palakattu Canal. Sippar is not likely to have had more than 15,000 inhabitants at any time. Consult: Hormuzd Rassam, *Asshur and the Land of Nimrod* (New York, 1897); V. Scheil, in *Mémoires Français d'Archéologie Orientale de l'Institut de Caïre* (Cairo, 1902);

Rudolph Zehnfund, *Babylonien in seinen wichtigsten Ruinenstätten* (Leipzig, 1910).

**SIR-DARYA**, sĕr'dür'yā. A river and territory of Russian Turkestan. See SYR-DARYA.

**SIREN** (Lat. *siren*, from Gk. σειρήν, *seirēn*, siren). In Greek legend, one of several sea maidens with voices of such sweetness that all who heard their songs were drawn to them, only to meet death, so that the shores of their lovely island were covered with bones and corpses. In the *Odyssey*, xii, Circe gives Ulysses advice by which alone the hero passes in safety. He stopped the ears of his companions with wax, that they might not be turned from their rowing, while he caused himself to be bound firmly to the mast so that he might hear the songs without danger. The sirens figure also in the voyage of the Argonauts (q.v.), who escaped only because of the superior charms of the song of Orpheus. Later legend represented that, once successfully resisted, the Sirens were doomed. Another legend connected them with the rape of Persephone. Here they were said to have grieved excessively at the loss of their friend and to have sought for her over land and sea. They are represented in art at first as birds with female heads, but more and more the human element predominates, until little of the bird is left but wings and legs. The type seems connected with the representations of the souls of the dead in the form of birds. Consult: Weicker, *Der Seelenvogel in der alten Litteratur und Kunst* (Leipzig, 1903); Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906); C. M. Gayley, *Classic Myth in English Literature and in Art* (2d ed., Boston, 1911); the article "Seirenes," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

**SIREN.** An instrument or device for the production of sounds. In the simplest form of siren there is a revolving disk pierced with a series of holes arranged in a circle. If air from a source of pressure strikes the disk at a point which is passed by the holes in their revolution, a series of sounds will be produced by the successive puffs of air escaping through these openings. While the disk revolves slowly, the ear

CROSS SECTION OF SIREN.

distinguishes these successive puffs; but when the revolutions are more numerous than about 10 per second, the successive puffs cannot be distinguished, and the recurrent sounds are merged into a uniform note, whose pitch rises the faster the disk revolves. This device shows that musical sounds consist of the repetition, at equal and very small intervals of time, of

some definite noise. By turning the disk by means of a train of wheels, so as to give it a definite rate of rotation, the number of such repetitions per second necessary for the production of a given musical note may be determined.

The siren invented by Caignard de la Tour in 1819 registers the number of revolutions per second. In principle it is identical with the simpler instrument just described, but in construction it consists essentially of two circular disks, the upper of which is free to revolve upon the lower, being pivoted at *A* and *b*. In each a series of holes is cut, arranged at equal distances in a circle about its axis. Through the holes in the lower (fixed) plate streams of air are admitted from a reservoir, *B*, connected with a bellows, and pass through the corresponding holes in the upper (movable) plate, when the pair of holes are superposed, but are checked when the upper plate is turned a little, readmitted when the plate turns a little farther, and so on. The holes are pierced *obliquely* through the upper plate, so that the issuing stream makes it turn about its axis. The sounds given by this instrument are exceedingly pure (see *ACOUSTICS*), like those of the flute or tuning fork. The axis of the upper plate carries an endless screw, *S*, which turns a light train of wheels, *G* and *H*, with hands and dials resembling those of a gas meter, so that when, by proper adjustment of the pressure of the bellows, the instrument gives steadily some definite note, corresponding with that of an organ pipe or tuning fork whose pitch we desire to ascertain, we may observe the number of turns in any number of seconds by a stop watch. The number of puffs is obviously to be found from this by multiplying the number of holes in the plate.

Large instruments operated by steam are used as fog signals. Complex forms, such as Helmholtz's double siren and the apparatus of Moray, have been devised for investigations in the more advanced fields of acoustics. Consult: Tyndall, *Sound* (3d ed., New York, 1908); H. L. F. von Helmholtz, *Die Lehre von den Tonempfindungen* (6th ed., Brunswick, 1913; Eng. trans. of earlier ed., New York, 1895); Mühler-Pouillet, *Lehrbuch der Physik* (Brunswick, 1897). See FOG SIGNALS.

**SIREN.** An eel-like batrachian of the degraded family Sirenidae. See MUD PUPPY.

**SIRENIA** (Neo-Lat. nom. pl., from Lat. *siren*, siren). An order of large aquatic herbivorous mammals, of doubtful affinity, including the sea cows, manatees, and dugongs (qq.v.). The early fossil members of this group, found in the Eocene deposits, differ from the modern forms in showing a slightly less marked degeneration from the normal mammalian type. They have more primitive dentition and better developed hind limbs. Their origin is unknown, for they appeared suddenly with their peculiar characters fully evolved in the Eocene. The principal fossil genera are *Prorastomus* and *Haliitherium*.

**SIRIUS** (Lat., from Gk. *Σείριος*, *Seirios*, scorching). The brightest star in the heavens, its magnitude being 1.4. It is situated in the constellation Canis Major (q.v.), or the Great Dog. For this reason it is also called the Dog Star. It has long been known to possess a proper motion, i.e., an independent progressive motion, which was once believed to be uniform. The nonuniformity of the motion was first sus-

pected by Bessel, who in 1844 announced that Sirius possessed an obscure companion and that the irregularity was due to the revolution of the pair about their common centre of gravity in about 50 years. Safford predicted the position of this companion, supposing it to be too minute to be seen, but it was actually discovered in the predicted place in January, 1862, by Alvan Clark while observing Sirius through a new and powerful telescope which he had just made. Gill found the parallax of Sirius to be 0.37", corresponding to a distance of 8.8 light years.

The Egyptians called Sirius "Sothis," and at one time its heliacal rising (q.v.) was a sure forerunner of the rising of the Nile, while among the Romans it was considered as a star of evil omen. The term Dog Star was also applied to Procyon, a bright double star in Canis Minor, the small companion of which was found by Schaeberle at the Lick Observatory in 1896.

**SIR JOHN OLD-CAS'TLE.** A play by Drayton, Munday, Wilson, and Hathaway, printed in 1600 with Shakespeare's name on the title-page, afterward withdrawn. It is founded on the story of Lord Cobham, whose name was first used by Shakespeare for Sir John Falstaff.

**SIR LAUNCELOT** (lân'se-lôt) **GREAVES,** *THE ADVENTURES OF.* A romance by Smollett (1761) in imitation of *Don Quixote*.

**SIROC'CO** (It., from Ar. *sharg*, east, from *sharaga*, to rise [of the sun]). A hot wind. In the desert of Sahara, a hot, dry wind with clouds of dust, not so violent as a simoom (q.v.). On the northern Mediterranean two classes of warm winds—the moist, sultry wind followed by rain, and the hot dry wind from the south that brings a dusty haze.

**SIR ROGER DE COVERLEY.** See COVERLEY, SIR ROGER DE.

**SIRVENTES**, sêr'vânt', or **SIRVENTE** (Fr. *servente*, Prov. *sirventes*, *serventes*, a song, from *servir*, serve). A name applied to a class of poems important in Provençal literature of the twelfth and thirteenth centuries, usually, in contradistinction from the love songs, dealing with contemporary social or political conditions and frequently of a satiric nature. See *PROVENÇAL LITERATURE*.

**SISAL**, sê-sâl', sîs'al, or sî'sal. A fibre obtained from an American agave, which is cultivated in tropical America and elsewhere. See HEMP, SISAL. For Mexican sisal, see HENEQUEN.

**SIS'CO.** A whitefish. See CISCO.

**SIS'COWET.** A salmon (*Salmo siscowet*) of the deeper waters of Lake Superior, where it is numerous. It differs so little from the land-locked salmon of other northern lakes, called namaycush in Canada, that some ichthyologists regard it as a mere variety of that widespread form.

**SISEN'NA**, LUCIUS CORNELIUS (c.119–67 B.C.). A Roman annalist (see *ANNALS*), considered by Cicero (*Brutus*, 288) superior as an historian to any of his predecessors. He was prætor in 78 B.C. and during the war against the pirates (67 B.C.) was appointed by Pompey commander of the army in Crete. He was a friend and defender of Verres. (Cicero, *Verres*, ii, 100.) Sisen'na's works included his *Historiæ*, in more than 12 books, which embraced the history of his own time, and a Latin translation of the Milesian tales (*Μιλησιακά*) of Aristides. (See *MILESIAN TALES*.) The commentaries on Plautus which were formerly ascribed

to him were probably written by another person of the same name. The few extant fragments of the *Historiæ* are published in Peter's *Historiæ Romanorum Fragmenta* (Leipzig, 1883). Consult Schneider, *De Sisennæ Historiæ Reliquiis* (Jena, 1882), and Martin Schanz, *Geschichte der römischen Litteratur*, vol. i, part ii (3d ed., Munich, 1909).

**SIS'KIN** (from Slov. *chizhek*, Russ. *chizhū*, siskin; connected with OPers. *czila*, siskin). A small finch of the Old World (*Spinus*, or *Carduelis*, *spinus*), allied to the goldfinch, 4½ inches long and greenish gray, yellow, and black. It is found in the temperate parts of Europe and Asia and is often kept and bred in cages and called by dealers aberdevine. The siskin of America is the pine finch (q.v.).

**SISLEY**, se'slā', ALFRED (1830-09). A French landscape painter. He was born in Paris, of English parentage, and studied under Gleyre, but was little known until after the first Impressionist exhibition of 1874. His early work was influenced by Corot, but this influence was afterward modified by the color theories of the Impressionists, particularly as practiced by Monet. His subjects are confined almost entirely to landscape and generally to calm, smiling country scenes or gliding rivers. He was one of the most remarkable landscape painters of his day, and one whose bold, honest, and withal delicately charming and poetic view was combined with high qualities as a colorist and uncommon facility in rendering the luminous quality of atmosphere. His numerous works include "Inundation, Marly," "Bridge at Moret-sur-Loing," and eight paintings in the Luxembourg. Sisley was not appreciated and struggled with poverty during his lifetime, but his pictures brought high prices after his death. Consult George Moore, *Modern Painting* (London, 1893).

**SISMON'DI**, Fr. pron. sēs'mōn'dē', JEAN CHARLES LÉONARD SIMONDE DE (1773-1842). A French historian and economist, born at Geneva. The French Revolution forced his family to leave Geneva and take refuge in England. In 1795 they went to Italy, to a small farm near Pescia in Tuscany, where circumstances rendered it necessary for Sismondi to engage in farm work. In 1798 he began to collect materials for a history of the Italian republics. In 1803 appeared a work on political economy, *De la richesse commerciale*, in which he seems a follower of Adam Smith, though later, in his *Nouveaux principes d'économie politique* (2 vols., 1819), he abandoned those views and opposed the ideas of the English economists. In history, however, his best work was done. The *Histoire des républiques italiennes* (16 vols., 1807-18) placed him in the first rank among contemporary historians and brought him great praise. In 1813 appeared his *Littérature du midi de l'Europe*, since translated into English and frequently reprinted. In 1819 he began his best work, the *Histoire des Français* (31 vols., 1821-44), of which he published an abstract later: *Précis de l'histoire des Français* (2 vols., 1839). Besides the works mentioned above, Sismondi wrote: *Histoire de la renaissance de la liberté en Italie* (2 vols., 1832); *Histoire de la chute de l'empire romain* (2 vols., 1835); *Etudes sur les sciences sociales* (Paris, 1836-38). His letters have been published in various editions as: *Fragmenta du journal et de la correspondance de S. de Sismondi* (Geneva, 1857);

Taillaudier, *Lettres inédites de Sismondi* (Paris, 1863); Villari and Monod, *Lettres inédites de Sismondi* (ib., 1878). Consult Aftalion, *L'Œuvre économique de Sismondi* (Paris, 1889).

**SIS'SOO**. See DALBERGIA.

**SISTAN**. See SEISTAN.

**SISTER DORA**. See PATTISON, DOROTHY.

**SISTERHOODS**. Communities of women in the Roman Catholic and Anglican churches, organized for religious and charitable purposes. The earlier communities for women were nearly always outgrowths of an earlier institute for men, after which their organization was closely modeled; these second orders for women exist, e.g., under the rules of the Benedictine, Cistercian, Dominican, and Franciscan orders. They were, until the seventeenth century, nearly always cloistered communities.

With the increase of security for the weak in modern society their activity was widened, and they took part in active charitable work among the poor, the sick, and the ignorant.

The more important Roman Catholic sisterhoods are treated under their own titles. About the middle of the nineteenth century a movement developed among non-Catholics, in England and Germany, for the organization of women's work in the same fields. In the latter country it developed chiefly a class known as deaconesses (q.v.), but in England the movement, coinciding with the Tractarian revival of the older doctrine and customs, assumed a form practically identical with that already described. After one or two tentative efforts in London (1845) and Oxford (1847) the movement took definite root with the foundation of the community at Devonport in 1848. Its members, known as Sisters of Mercy, were bound by no vows except one of obedience to the superior, while they remained connected with it. Three years earlier Dr. Muhlenberg had established the Sisters of the Holy Communion in New York. These had no fixed costume, were required to be between 25 and 40 years old, and they might leave the sisterhood at pleasure. This community was placed in charge of St. Luke's Hospital, which Dr. Muhlenberg founded. Numerous organizations of the kind have since grown up both in England and America and have proved useful auxiliaries to the clergy in work among the poor. The later ones usually follow the model of the Roman Catholic sisterhoods, have similar ideals of life, and follow similar practices. In 1903, besides some communities of deaconesses, there were 21 organizations of this kind in the United States. In 1914 there were 165 Roman Catholic sisterhoods. Consult: Goodman, *Sisterhoods in the Church of England* (London, 1863); Potter, *Sisterhoods and Deaconesses* (New York, 1873); Littledale, *Papers on Sisterhoods* (London, 1874-78); T. Schäfer, *Geschichte der weiblichen Diakonie* (3 vols., Stuttgart, 1887-94); Christian Golder, *History of the Deaconess Movement in the Christian Church* (New York, 1903); for the growth of the Roman Catholic communities, the bibliography under MONASTICISM.

**SISTER HOOK**. See CLIP HOOKS.

**SISTERS OF CHARITY**. See BROTHERS AND SISTERS OF CHARITY.

**SISTERS OF MERCY**. See MERCY, SISTERS OF.

**SISTERS OF THE CONCEPTION OF OUR LADY**. See CONCEPTION OF OUR LADY, SISTERS OF THE.

**SISTINE** (sī'stēn or -tīn) CHAPEL. The private chapel of the Pope in the Vatican. It was built for Sixtus IV in 1473 by the Florentine architect Giovanni de' Dolci. The apartment is 133 feet long, 45 feet wide, and somewhat higher than its width. It is lighted by six windows on each side and three in the rear. The screen separating the congregation from the part reserved for the Pope and cardinals is one of the best pieces of marble decoration of the early Renaissance, and the tribune of the singers is equally good. The floor is decorated with beautiful mosaics in imitation of early Christian work. The walls and ceiling are without adornment excepting the frescoes, which form the chief attraction of the chapel. The walls are a museum of the works of the best Tuscan and Umbrian painters of the later fifteenth century, and they contain works by Botticelli, Roselli, Ghirlandaio, Signorelli, Perugino, and Pinturicchio (qq.v.). On the left wall are incidents from the "History of Moses," while on the right are six corresponding scenes from the "Life of Christ." Above these are portraits of the different popes; below them formerly hung, on great occasions, the famous tapestries of Raphael (q.v.). On the ceiling are the wonderful frescoes of Michelangelo: the "Creation," the "History of Noah," etc., together with the celebrated "Prophets" and "Sibyls"—one of the greatest creations of modern art. The entire altar wall is covered by his "Last Judgment," the largest fresco in the world. (See MICHELANGELO.) The paintings have been greatly damaged by time and incense. The Sistine Chapel is the scene of most of the great functions at which the Pope personally assists, and here the papal elections are held. Its choir was founded by Gregory the Great and is composed of about 30 priests and papal chaplains. They sing without accompaniment, and their style, the *missa di voce*, is of world-wide celebrity. Consult Ernst Steinmann, *Die sätinische Kapelle* (Munich, 1901-05), a monumental publication of reproductions with text.

**SISTINE MADONNA.** See MADONNA, and Plate with RAPHAEL SANI.

**SISTOVA**, sīs'tō-vā. A town of Bulgaria, on the Danube, about 40 miles above Rustchuk (Map: Balkan Peninsula, E 3). It has a considerable trade in grain and wine. Pop., 1905, 13,408. Sistova is noted for the treaty of peace concluded here between Austria and Turkey in 1791.

**SISUPALA**, shish'pā-lā. In Hindu legend, the sovereign of Chedi, a country of central India. Although he was the cousin of Krishna (q.v.), he was his enemy and ultimately was slain by him. The history of this enmity forms the subject of the *Sisupālavadhā* attributed to Magha, because of which it also goes by the name of *Māghakāvya*. This is a highly artificial Sanskrit epic in 20 cantos, which dates probably from the ninth century. It has been edited several times in India, notably, with Mallinatha's commentary, by Durgaprasad and Sivadatta (3d ed., Bombay, 1902), and was translated by Fauche in his *Tétrade*, vol. iii (Paris, 1863). Consult V. Henry, *Les littératures de l'Inde* (Paris, 1904), and A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

**SISYPHUS** (Lat., from Gk. Σίσυφος). In Greek legend, the son of Æolus and Enarete. According to the earlier myth he was married to

Merope, but later tradition made him the father of Odysseus by Anticlea. Sisyphus is said to have been the founder and King of Ephyra, afterward Corinth, and became notorious as a wicked ruler. For this he was punished in the lower world by being condemned to roll from the bottom to the summit of a hill an immense boulder which, whenever it reached the top, rolled down again and compelled him to begin his task anew.

**SITA**, sē'tā (Skt., furrow). In the Sanskrit epic of the *Ramayana* (q.v.), the daughter of Janaka, King of Videha, and the wife of Rama. She seems to have been originally an earth goddess, as Sita (the furrow) is invoked in the Rig and Atharva Vedās (see VEDAS) to grant rich blessings and crops. In the later Hindu accounts she is said to have arisen from a furrow when her father was plowing the ground. Consult A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897).

**SITATUNGA**, sit'ā-tūŋ'gā. A "harnessed" antelope. See NAKONG.

**SITKA**. An Indian tribe, the largest of the Kolushan (Tlinkit) stock, occupying Chichagof, Baranov, Kupreanof, Kuiu, and a part of the Prince of Wales islands, southern Alaska, and numbering with subtribes about 600. The town of Sitka derives its name from them. From the enormous wooden labrets worn by their women the Russians called the tribe Kalush, from the Russian *kalushka* (a wooden trough or bowl); hence the name Kolushan now applied to the stock. They were formerly a fierce and independent people, but are now greatly demoralized and wasted. Their general culture is that common to the Tlinkit (q.v.).

**SITKA**. A town and the former capital of Alaska (Map: Alaska, N 7). It is situated on the west coast of Baranov Island, facing Sitka Sound, in close proximity to several snow-clad peaks. The climate, in spite of its northern latitude, is mild, the average temperature of December being 32° F. and of August 56° F. The rainfall is heavy, amounting to 84 inches annually. Among the noteworthy features are the Russo-Greek church, dating from 1816, the church of St. Peter's by the Sea, erected in 1890, and the Sheldon Jackson Museum, connected with the Presbyterian Mission. The educational institutions include United States public schools, a Russo-Greek parochial school, and the Presbyterian Industrial Training School for natives. There are also to be mentioned the headquarters of the agricultural experiment stations of Alaska, the Coast Survey Magnetic Base Station, and a customs office. Sitka is the residence of the Episcopal Bishop of Alaska and of the Russian Bishop. In 1799 the Russian American Company established a trading post at Sitka, which, under the name of New Archangel, was permanently occupied by the Russians in 1804. It became later the seat of the Russian territorial government. Pop., 1910, 1039.

**SI'TOPHO'BIA** (Neo-Lat., from Gk. σίτος, *sitos*, food + -φοβία, *-phobia*, fear, from φοβέσθαι, *phobeisthai*, to fear). A dread or fear of food, experienced by insane people, which leads them to refuse to eat.

**SITTEN**, zit'ten. A city of Switzerland. See SION.

**SITTEWALD**, zit'e-vālt, PHILANDER VON. See MOSCHEROSCH, J. M.

**SITTING BULL** (Tatanka Yotanka) (1837-

90). A chief of the Sioux tribe of North American Indians, born in Willow Creek in the region later Dakota Territory, the son of Chief Jumping Bull. He became the leader of the most unruly and warlike band of bucks in the tribe. During the Civil War he led raids and engaged in attacks upon white settlements in Iowa and Minnesota and in 1864 was driven by General Sully into the Yellowstone and Big Horn valleys. He was on the warpath almost continuously from 1869 to 1876, raiding the frontier posts and settlements or making war on the Crows and other tribes. His refusal to return to his reservation in 1876 led General Sheridan to begin against him the campaign in which Gen. G. A. Custer (q.v.) and his force were surprised and massacred on the Little Big Horn in June of that year. Sitting Bull and his braves escaped over the Canadian border, remaining there until 1881, when he received from General Miles a promise of amnesty and returned. He continued to wield great power among the Northwestern Indians, and in 1888 he influenced the Sioux to refuse to sell their lands. In 1890 during the prevalence of the Messiah craze among the Indians of the West he was considered the principal instigator of the threatened uprising. His arrest in his camp on the Grand River in North Dakota on Dec. 15, 1890, was followed by an attempt at rescue, during which he was killed. See **SIoux**.

**SIUT**. See **ASSIUT**.

**SIUYEN**, shü'wên'. A walled city of Shing-king, Manchuria, on the right bank of the Tayang River, which flows southward to the Yellow Sea at the port of Takushan, distant 35 miles (Map: China, M 3). It is famous for the finely grained marble found in the neighborhood and its stone-cutting and polishing industry.

**SIVA**, shí'vá (Skt., gracious, auspicious). The name of the third god of the Hindu Trimurti or triad, in which he represents the principle of destruction. As a deity he is unknown in the Vedic hymns, but is found in the later Brahmanic literature, the epic poems, the Puranas (q.v.), and the Tantras (q.v.). Thus, in the *Mahabharata* (q.v.), Siva is already known as the all-containing god, and even in the Upanishads (q.v.) he is identified with the Vedic Rudra (q.v.) as the All-god. His symbol is the linga (q.v.), a phallic emblem, and from each of his numerous attributes he derives a name or epithet. He has five heads (hence his name Pancanana, the five-faced) and three eyes (hence his name Trinetra, the three-eyed). On his head he bears the Ganges, whose course he intercepted by his hair when this river descended from heaven upon the Himalaya. Besides he carries a garland of human skulls and wears a rosary (afterward adopted by the Buddhists) and a necklace of serpents. In his hands he holds a trident, a club or pole resembling in form the breastbone and ribs adjoining, which in turn are surmounted by a skull. His weapons are a bow, a thunderbolt, and an axe. As the destroyer of the world he is also called Kala (time or death) and represented as of black color. One of his representations is also half male and half female, emblematic of the indissoluble unity of the creative principle (hence his name Ardhanarisa, half-female lord). He is often clothed in a deerskin and may be represented as sitting on a tiger skin. His sacred animal is the bull Nandi; his home is

on Mount Kailasa in the Himalaya, his principal wife is Durga, or Uma (q.v.); his sons are Ganesa (q.v.) and Kartikeya (q.v.).

Siva is the god of asceticism, but also of all art, especially of dancing. In the earlier accounts he is represented as an opponent of the Vedic gods, and especially as destroying Daksha, symbolic of the older Vedic rites, an intimation of the overthrow of the orthodox religion by the more popular cult of Siva. As a symbol of asceticism he is the destroyer of Kama, the god of love. Though Siva has no incarnations, he is identified with various local gods, especially Bhairava and Vitthoba. He has a great many names, but is generally called Lord, Mahesvara, or Sankara, Beneficent, or Pasupati, Kinc Lord, or simply Mahadeva, great god. The cult of Siva is probably of non-Aryan origin and has much in common with Buddhism, and in the art of c.800 A.D. the two are confused. To-day the Siva cult (see **SAIVAS**) is the most universal in India. Consult E. W. Hopkins, *Religions of India* (Boston, 1895); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1898); L. D. Barnett, *Antiquities of India* (London, 1913). See **HINDUISM**; **SIVA** in **PLATE OF HINDU DEITIES**, under **INDIA**.

**SIVAS**, sé'väs'. The capital of the Vilayet of Sivas, Asiatic Turkey, situated on the Kizil Irmak at an altitude of 4420 feet (Map: Turkey in Asia, C 2). It covers a large extent of ground, is well built, and has numerous old mosques, khans, gardens, and excellent bazars. It contains several interesting ruined medreses, or colleges, beautifully decorated. Besides the Greek churches, there are a Roman Catholic and a Protestant church. The manufactures include coarse woollens and copper utensils. Sivas is built on the site of the ancient Sebastia. It was formerly one of the most important cities of Asia Minor on account of its strategic position. In the fourteenth century it had 100,000 inhabitants. Pop., about 65,000.

**SIVASH**, sé'vash', or **PUTRID SEA** (Russ. *Gniloye More*). A lagoon on the east coast of the Crimea, cut off from the Sea of Azov by a narrow sand bar, the Tongue of Arabat (Map: Russia, D 5). It is 68 miles long, from 2 to 14 miles wide, and extremely shallow, consisting largely of salt marshes. The water is stagnant and excessively salt.

**SIVATHERIUM** (Neo-Lat., from Skt. *Siva*, name of a Hindu god + Gk. *θηρίον*, *thērion*, dim. of *θήρ*, *thēr*, wild beast). An extinct giraffe, of much larger size than the living species, found fossil in the Siwalik beds of Pliocene age in India. The skull was heavily built and provided with two pairs of horns, of which the anterior pair were small and pointed, while the posterior pair were large and slightly palmate with a few short prongs. Another genus, *Samotherium*, from the Pliocene of the isle of Samos, had shorter neck and limbs than those of the modern giraffe, and the skull of the male alone was provided with a single pair of frontal horns.

**SIVERTSEN**, sé'vert-sen, CURT. See **ADELAAR**.

**SIVORI**, sé-vō'rē, ERNESTO CAMILLO (1815-94). An Italian violin virtuoso, born in Genoa. At the age of five years he commenced his studies with Restano, after which he became a pupil of Costa and then of Paganini. In 1827 he went to Paris, where he won remarkable success by his marvelous technique. In 1829 he toured Italy, Germany, and Russia and in 1840

America. He composed concertos and other works for the violin.

**SIWAH**, sê'wā (anc. *Ammonium*). An oasis in the Libyan Desert in northwest Egypt, 280 miles southwest of Alexandria (Map: Africa, G 2), with which it has telegraph connection. It is nearly 20 miles long, over 1 mile broad, and has about 25 square miles of agricultural land. It lies nearly 100 feet below sea level, is watered by numerous streamlets, small lakes, and marshes, and is covered with palm groves and orchards. Pop., 1909, 3884, mostly engaged in the cultivation of dates, which form a very important item of export, amounting to 3,000,000 pounds annually. There is a theological seminary. The temple of Ammon was famous for its oracle in ancient times. In the vicinity is situated the celebrated Fountain of the Sun, mentioned by Herodotus. The miniature town of Siwah is compactly built with lofty dwellings. There is also another settlement, called Aghormi, 2 miles distant, with remains of ancient temples.

**SIX ACTS, THE**. The name given to a number of measures enacted by the British Parliament in 1819-20 aiming at the repression of the growing democratic movement. The freedom of speech and of the press and the right of association were greatly restricted. See under UNITED KINGDOM.

**SIX ARTICLES, THE STATUTE OF**. See ARTICLES, THE SIX.

**SIX COMPANIES, THE CHINESE**. Six mutual-aid associations representing six different parts of the Province of Kwangtung, China. They are partly benevolent and partly commercial, taking care of emigrants from China, giving advice and aid when needed, acting as their bankers, looking after the sick, and forwarding the bodies of the dead to their friends in China for burial in their native place. Membership is entirely voluntary, and they are in no sense secret societies. They are an outgrowth of the conditions prevailing in the middle of the nineteenth century, when coolie labor was needed and was supplied to contractors in the United States by contractors in Hongkong, Canton, Macao, and elsewhere, whose agents were settled in San Francisco. In course of time groups of these agents combined for self-protection, but on the abolition of coolie traffic and all forms of contract labor and restriction of immigration these developed into benefit and protection societies, lending money, etc. The Six Companies are Ning Yeung, the largest and most powerful, Hop Wo, Kong Chow, Yung Yo, Sam Yup, and Yang Ying.

**SIX NATIONS**. See IROQUOIS.

**SIX-PRINCIPLE BAPTISTS**. See BAPTISTS.

**SIXTH**. See INTERVAL.

**SIXTUS**. The name of five popes.—**SIXTUS** or **XYSTUS I**, Saint. Pope, c.116-125, under the reign of Hadrian. His day is April 6.—**SIXTUS** or **XYSTUS II**, Saint. Pope, 257-258. Under him the communion between Rome and the North African churches, broken off by the controversy over heretic baptism (q.v.), was restored. He died a martyr under Valerian. His day is August 6.—**SIXTUS III**, Saint. Pope, 432-440. He restored the Liberian basilica (Santa Maria Maggiore), in which his work is extant to-day, as also in the nave of another basilica, the church of San Lorenzo. His day is March 28.—**SIXTUS IV** (Francesco della Rovere). Pope,

1471-84. He was born in 1414 and became general of the Franciscan Order in 1464. His nepotism is the worst blot upon his pontificate and led indirectly, through the ambition of his brother Girolamo, to unfortunate connection with the affairs of Florence. The Pope's 18-year-old nephew, Cardinal Sansoni-Riario, having been arrested in connection with the assassination of Giuliano de' Medici, Sixtus demanded his release. Interdict, excommunication, and war followed; but after Lorenzo had won over the Pope's ally, the King of Naples, peace was made in 1480. Sixtus, bitterly humiliated by complications with Venice in 1484, died five days later. Many public works were furthered by him, of which the most famous is the Sistine Chapel and the Ponte Sisto. Taxation, increased to carry out these projects and to provide for the Pope's family, heightened the disaffection against the Church. Consult: Frantz, *Status IV. und die Republik Florenz* (Regensburg, 1880); Mandell Creighton, *History of the Papacy*, vol. iv (London, 1903); Ludwig Pastor, *History of the Popes*, vol. iv (Eng. trans. by Antrobus and Kerr, ib., 1910).—**SIXTUS V** (Felice Peretti). Pope, 1585-90. He was born in 1521 in the March of Ancona, the son of a poor gardener. Like Sixtus IV he entered the Franciscan Order and became Bishop of Sant' Agata in 1566 and Cardinal in 1570. Being in disfavor with the preceding Pope, Gregory XIII, he had lived a quiet and retired life before and surprised the world by the masterful vigor of his reign. He began by repressing lawless disorders in the Papal States, reformed the administration of law and the disposal of patronage, and entered on projects for the improvement of Rome. He laid down new regulations for the College of Cardinals, restricting its number to 70, and organized the modern system of congregations (q.v.), reorganizing that of the Inquisition which already existed; at the same time he disapproved the rigor of the Spanish Inquisition as a state tribunal under Philip II. He published a new edition of the Septuagint and an edition of the Vulgate (1590). He died Aug. 27, 1590. Many of the popular stories concerning him are derived from the *Life* by Gregorio Leti (1669; Eng. trans., 1754), a thoroughly untrustworthy work, answered by Tempesti, a Franciscan, in 1755. The best modern *Life* is by Baron von Hübnér (Eng. trans., London, 1872). Consult also Capranica, *Papa Sisto* (Milan, 1884), and *Cambridge Modern History*, vol. iii (New York, 1904).

**SIZE**. See GELATIN; GLUE.

**SIZERANNE, MAURICE and ROBERT DE LA**. See LA SIZERANNE.

**SIZING**. See PAPER.

**SJÖBERG**, shê'bârj, ERIK (1794-1828). A Swedish poet, born at Ludgo and known in literature as Vitalis. He was educated at the University of Upsala, where he lived before removing to Stockholm. His poems—erotic, religious, humorous, melancholy—appeared between 1819 and 1826, and were collected after his death by Geijer (1828). In 1873 a new edition by Forselius appeared as *Samlade skrifter af Vitalis*. A German translation was published at Leipzig in 1843.

**SJÖSTEDT**, shês'têt, ERNEST ADOLF (1854-). A Canadian mining and metallurgical engineer. He was born in Sweden and graduated in 1876 at the Royal School of Mines, Stockholm. He was assistant chemist at the Beth-

lehem (Pa.) Steel Works (1877), was in charge of the charcoal iron furnaces at Shelby, Ala., and Cherokee, Ga. (1880-85); superintendent of furnaces at Katahdin, Me. (1885-90), general manager of the Charcoal Iron Company at Pictou, Nova Scotia (1890-96), and in 1898 became chief metallurgist of the Lake Superior Power Company at Sault Ste. Marie. Among his inventions are iron-ore and sulphide roasters, electric smelting furnaces, and an electrolytic process which accomplishes the separation of copper and nickel.

**SKABITCHEVSKY**, skü'bê-chëf'ski, ALEXANDRE MIKHAILOVITCH (1838-1911). A Russian critic and literary historian. He graduated from St. Petersburg University in 1861. Besides literary essays, which were several times collected, he published *A History of the Newest Russian Literature* (5th ed., 1903), *An Outline History of Russian Censorship* (1890), and *Russian Writers since Peter the Great* (1908), a textbook. As a critic Skabitchevsky lacked originality and philosophic breadth, but as a historian he was notable for a lucid style.

**SKAGEN**, skü'gen, CAPE, or THE SKAW. The most northerly point of Jutland, Denmark (Map: Denmark, D 1), a narrow sand spit on which stands a high stone lighthouse. Near it is the busy port of Skagen.

**SKAGER-RAK**, skü'gër-räk'. An arm of the North Sea between the south coast of Norway and the peninsula of Jutland, Denmark, and washing also the coast of Sweden (Map: Denmark, C 1). Together with the Cattegat and the sound, it connects the North Sea with the Baltic and is about 130 miles long by 80 miles wide. It is shallow near Jutland, where the coast has dangerous sand banks, but deepens northward, being over 2000 feet deep near the Norwegian coast. The latter, as well as the Swedish coast, is indented with bays affording good harbors. The Skager-rak is subject to violent northwest storms.

**SKAGIT**, skäg'it. See SALISHAN STOCK.

**SKAGWAY**. A subport of entry in the southern district of Alaska, on Lynn Canal (Map: Alaska, N 6). It is the terminus of the White Pass and Yukon Railroad and of the Seattle and Skagway steamship lines. Skagway lies amid attractive scenery. It has a public library, a United States government building, and three hospitals. An army post, Fort W. H. Seward, is 15 miles distant. The city is chiefly important as the distributing point of supplies for the interior and is the port through which pass all supplies and travel to and from the Canadian Klondike. Skagway was settled in 1897. Pop., 1910, 872.

**SKALD** (Icel., poet), or **SCALD**, skald or skáld. The name given in Old Norse to poets who exercised their art as a vocation requiring learning, i.e., a knowledge of the construction of verse and of the enigmatical imagery, roughly shaped out of obscure tradition, to which Scandinavian poets were prone. The great aim of the Skaldic poets was to celebrate the deeds of living warriors or of ancestors. Princes attached skalds to their courts and competed with each other, by magnificent presents, to retain the most skillful minstrels. See ICELANDIC LITERATURE.

**SKAMDRUP**, SOPHUS. See SCHANDORPH, SOPHUS.

**SKAT**, skät (derivation obscure). A game of cards that had its origin in Germany about the

beginning of the nineteenth century. A special deck of cards is used, and the game is so intricate and scientific that it is impossible to describe it within the space at our disposal. Consult R. F. Foster, *Skat Manual* (2d ed., New York, 1906).

**SKATE** (from Icel. *skata*, skate; perhaps from Lat. *squatius*, *squatina*, sort of shark, angel fish). The name of certain species of the ray (q.v.). The commonest as well as the smallest species along the east coast of the United States is the tobacco box (*Raja erinacea*); the largest is the barn-door skate (*Raja larvis*), 4 feet long. The big skate of California is the largest of the American skates. It sometimes reaches a length of 6 feet, and its egg case is nearly 1 foot long. The flesh, though rather coarse, is at times eaten by Europeans. See PLATE of RAYS AND SKATES.

**SKATING** (from *skate*, from Dutch *schaats*, O Dutch, *schaetse*, high-heeled shoe). One of the primitive methods of man's progression over the clear ice. The earliest form of skate was a shin or rib bone of some animal, tied to the foot, and was a Norse invention. Skates of bone are in the Guildhall collection in London and in other museums. The date of the origin of the skate with metal runners is unknown, but it seems likely that it is early, perhaps in the third century. With the development of a metal foot piece bearing a cutting edge progress without the aid of the stick was acquired, the blade being set within a base of wood strapped to the foot. Holland is still the best country for skating; aside from practical uses, it is there a national sport. Other notable skating countries are Russia, Norway, and Germany. It had become a common sport in England in the twelfth century, and famous skaters have been produced, especially from the Fens on the east coast. The United States and Canada have produced many fast skaters who vie with the best of those abroad. On the Hudson River have been made some of the fastest skating records, although Minnesota and the Middle West generally now rank well. In 1884 a national amateur association was formed, with W. B. Curtis as president, and this has held successful championships ever since. Afterward Eastern and Western sectional championships were instituted, and in 1899 the distances were measured by meters, in accordance with the custom abroad. In 1915-16 the sport had a great revival in the eastern United States.

The development of the skate used in the United States embraces three distinct periods. The old-fashioned skate had a straight thick blade, sometimes with a double edge (gutter), affixed to a piece of wood, the skate being bound on by straps and by a screw in the heel. Then came the club skate, an improvement in that it was entirely of metal and could be instantly clamped to the foot, though the earlier form was attached to the heel by means of a heel plate set in the boot. The blades were of a rocker shape from end to end, which allowed fancy skating, but which reduced the speed in straight-away skating. Finally the Hudson River or Donoghue skate was introduced, at once finding favor, in the West especially. This was a return to the old-fashioned form, the skate being straight-bladed with wooden top and straps. The blade is long, projecting behind and before the foot and very narrow, and the club or foot piece, when properly made of apple wood, is

very light. With it has come into popular favor the Norwegian skate, the best skate known, which has a similar blade, fastened permanently to the shoe by metal pieces screwed to the sole. Its weight is but a few ounces. The hockey skate, a combination of the club and the Norwegian form, viz., a short, thick, and straight-bladed skate screwed to the shoe, is another popular form.

The style of skating in America has been not a little influenced by the speed skate, which by its nature has added considerable grace and power to the stroke. In pushing off therefore, with either foot, the whole length of the blade is obtained as a purchase instead of the toe only, as in the case of the club skate. The result is the greatest imaginable ease in skating, while the length of the stroke is two to three times as long, saving considerable energy.

The National Skating Association of the United States has championship contests both for speed and figure skaters, which are held annually usually in the neighborhood of New York, the figure skating being held indoors on artificial ice. Consult: E. F. Benson, *English Figure Skating* (London, 1908); H. H. Cobb, *Figure Skating in English Style* (ib., 1913); G. H. Browne, *Handbook of Figure Skating* (Springfield, Mass., 1913).

**SKAW**, ska, THE. The most northerly point of Denmark. See SKAGEN, CAPE.

**SKEAT**, skēt, WALTER WILLIAM (1835-1912). An English philologist. He was born in London, Nov. 21, 1835, and passed his boyhood at Sydenham, where he became familiar with the Kentish dialect. He graduated in 1858 at Christ's College, Cambridge, of which he was elected a fellow in 1860. He held two curacies, but an affection of the throat compelled him to give up the ministry. He resumed his studies at Cambridge in English philology and literature. In 1873 he helped to found the English Dialect Society, becoming its first director and afterward its president. He had already begun editing Middle English texts for the Early English Text Society, established by his friend F. J. Furnivall (q.v.). In 1878 he was appointed to the professorship of Anglo-Saxon at Cambridge, and in 1883 he was reelected fellow of Christ's College. Professor Skeat died Oct. 7, 1912. He wrote or edited in addition to many philological articles in magazines, the following separate works: *The Songs and Ballads of Uhland* (Ger. trans., 1864); *Lancelot of the Laik* (1865; revised, 1870); the three texts of Langland's *Piers Plowman* (1867-84; reprinted together, 1886); *An Etymological Dictionary of the English Language* (1879-82; 4th ed., 1910); *A Concise Etymological Dictionary of the English Language* (1882); *Principles of English Etymology* (2 vols., 1887-91); Barbour's *Bruce* (1870-77; and for the Scottish Text Society, 1893-94); *Complete Works of Geoffrey Chaucer* (6 vols., 1894-1900); *The Student's Chaucer* (1895); *A Student's Pastime*, being a select series of articles reprinted from *Notes and Queries* (1896); *The Chaucer Canon* (1900); *Place Names of Cambridgeshire* (1901); *Primer of Classical and English Philology* (1905); *Chaucer's Poems in Modern English* (6 vols., 1904-08); *Proverbs of Alfred* (1907); *Early English Proverbs* (1910); *Place Names of Berkshire* (1911); *The Science of Etymology* (1912); *Place Names of Suffolk* (1913); *Glossary of Tudor and Stuart Words* (1914); and many

other works. Skeat was one of the leading scholars in the revival of our older literature and has done much to popularize his subject. To him more than to all others is due the revival of interest in Chaucer.

**SKELETON** (from Gk. σκελετόν, *skeleton*, mummy, dried body, neut. sing. of σκελερός, *skeletos*, dried, from σκέλλειν, *skellein*, to parch, dry up). The framework of hard structure which protects and supports the soft tissues of animals. The skeleton either lies outside the soft tissues (exoskeleton) or is embedded within them (endoskeleton).

**Exoskeleton.** Exoskeletal structures surround and shield the vital organs and muscles and are represented by the shells or chitinous covering of mollusks, insects, and crustaceans, the shields of turtles, and the hair, scales, feathers, nails, and hoofs (qq.v.) of other vertebrates; also by the so-called "membrane bones" of the skull. Phylogenetically the exoskeleton of vertebrates is older than the endoskeleton, and its structures were derived from the inner layer of the epidermis.

**Endoskeleton.** Endoskeletal structures appear in a few invertebrates (as cuttlefishes, certain annelids, etc.), but are highly characteristic of vertebrates, in which arises a wholly new tissue—bone. Endoskeletal structures of vertebrates arise from two sources, the endoderm and the mesoderm, and are either membranous, cartilaginous, or bony. In the lower vertebrates conversion of cartilage into bone takes place on the outside and proceeds inward. In the higher vertebrates ossification also takes place at certain internal centres. In the conversion of cartilage into bone the chondrin or matrix of the cartilage becomes converted into a calcified matrix. The matrix is then dissolved away by certain cells (osteoclasts). Around the walls of the cavities thus produced certain cells (osteoblasts) arrange themselves in a layer and secrete about themselves salts (carbonate and phosphate) of lime. The spaces occupied by these cells and their amoeboid processes become much restricted, but persist as the lacunæ and canaliculi of bone. This calcified layer is in turn covered by another internal layer of osteoblasts, and these in turn by others, until a Haversian system with its concentric layers is produced. Bone is always thus being torn down by the osteoclasts and made over by the osteoblasts. See BONE.

The skeleton of vertebrates may be treated under two heads: (1) the axial and (2) the appendicular skeleton.

**Vertebral Column.** The axial skeleton includes the vertebral column, ribs, sternum, and head skeleton. The vertebral column, or backbone, first appears in cyclostomes, where it occurs as fibrous tissue, surrounding the notochord, which thus comes to lie as a rod in the axis of the primitive vertebrate column and is known as the "skeletogenous layer." From this point on it becomes a more and more important organ, while the chorda takes less and less part in the composition of the body of the adult. In the lowest vertebrates the skeletogenous layer is replaced at intervals by cartilage, which forms arches around the neural canal. In ganoids and higher forms these consist of five cartilaginous pieces for each somite, the fifth or unpaired piece forming the dorsal spinous process. Ventral cartilaginous pieces also occur ventral to the chorda. The bodies (centra) of the ver-

tebræ definitely appear, and the chorda becomes constricted intravertebrally, giving the vertebræ an hourglass form. The rings of cartilage formed by intravertebral constrictions are biconcave or amphiœolous in all fishes with bony vertebræ and in most Urodela; also in a few fossil and living reptiles (q.v.) and in a few fossil birds. So long as the separate vertebræ of the vertebral column are amphiœolous their connection with one another must depend upon something else than the bony vertebræ themselves. In the lower fishes this union is effected by the chorda and chordal sheath. In the lower Urodela it is effected by the intervertebral, non-ossified cartilage. In the higher Urodela, the Anura, and almost all the reptiles, however, the vertebræ are linked together by means of a ball-and-socket joint. The concavity may be on the posterior and the convexity on the anterior end (opisthocœlous) or conversely (proœlous). In crocodiles, birds, and mammals opposed faces of vertebræ are approximately plane surfaces. In the development of the vertebræ of man the phylogenetic stages are recapitulated. The typical vertebra of man consists of a centrum from which an arch arises dorsally to protect the spinal cord. These arches together constitute the neural canal. Each half arch is composed of the rounded pedicle and the broad flat lamina. There are three kinds of processes: (1) the dorsal or neuropophysis; (2) the transverse process, serving for the attachment of the muscles which keep the vertebræ together; (3) the forward and backward articulating processes (zygapophyses). The relation of the centra to the somites of the body is interesting. They do not arise one in the middle of each somite, but at the plane of separation of adjacent somites, thus insuring flexibility in the column.

The number of vertebræ in mammals is highly variable in different species. With one or two exceptions all mammals have seven cervical (nonrib-bearing) vertebræ. All the artiodactyls possess 19 thoracic-lumbar vertebræ. The smallest number (14) occurs in armadillos; the largest (30) in hyracoids. Since the number of vertebræ corresponds to that of the somites of the body, it seems necessary to conclude that the latter are highly variable in number. If we seek an interpretation of the differences in the vertebral column we may find it in the different tasks the parts perform, and the differentiation of vertebræ is a late acquisition, gradually acquired with advancing age. The sacral bones begin their fusion only at 16 years, and this is not completed until the age of 30. The sacrum is composed of four or five caudal vertebræ fused together.

**Ribs.** Ribs are also a part of the axial skeleton. Ventrally they end in cartilage and dorsally in two articular surfaces. The main part of the bone is the shaft or body, and its dorsal articular surface the head; on the side near the head is a second articular surface, the tuberosity; between this and the head there is a constriction, the neck. In man the last of the normally 12 ribs is occasionally reduced to an insignificant rudiment, or a thirteenth rib may be present. The transverse process of the seventh cervical vertebra and that of the first thoracic are quite different. The ventral arm of the transverse process of the seventh vertebra represents the rib. Similarly it may be inferred, even from the adult conditions, that all the cervical and trunk vertebræ possess ribs or the rudi-

ments of ribs; and embryology bears out this conclusion.

**Sternum.** The sternum or breastbone of man is a flat bone to which the ventral ends of the ribs are attached. Its anterior part is known as the manubrium, the middle part as the gladiolus, and the posterior cartilaginous tip as the xiphoid or ensiform appendix. The middle part is composed of more than one piece. In nearly all the lower mammals it is made up of as many bones as there are pairs of ribs attached to it, and this composition may be plainly seen in the sternum of a child. Moreover, the sternum of the young of many mammals shows a double origin, and it is plain that the sternum, if a product of the fusion of the ventral ends of the thoracic ribs, was originally laid down as a paired structure. The sternum of lower vertebrates is often closely united to the shoulder girdle and possesses an accessory bone, the episternum. The sternum of Amphibia is small, and the ribs do not meet ventrally. The sternum of most carinate birds is strongly keeled to permit of the attachment of powerful muscles of flight. See BIRD.

**Skull.** We may distinguish in the skull the cranium or brain case and the visceral skeleton. In the development of the human skull three stages may be distinguished which correspond with phylogenetic stages: 1. The fibro-connective tissue stage. This is represented in phylogeny by the condition in *Amphioxus*, where a fibrous cordal sheath surrounds the notochord. 2. The cartilaginous stage. In the anterior region of adult selachians a large cartilaginous capsule, open above, completely surrounds the brain below and laterally, derived from two pairs of cartilage plates. Ventral to the skull the visceral skeleton arises, consisting of the upper and lower jaws and the six branchial arches, the foremost of which early differentiated itself from the other five, entered into connection with the lower jaw, and constitutes the hyoid arch. The lower jaw arises in a manner precisely equivalent to a typical gill arch, and is composed of two pieces on each side, the quadrate and Meckel's cartilage. Very early a forward outgrowth from the quadrate gives rise to the upper jaw. 3. The bony stage is represented in the bony ganoids, where the frame case is covered by enamel plates. Dermal bones also cover the branchial arches and gills, forming the operculum. Even in the Amphibia the bones of the skull preformed in cartilage can be artificially separated from dermal bones, but the higher we go in the vertebrate scale the more intimate is the union, until in mammals the two bones are developed at the same time and are inseparably fused in the adult. With the loss of gills goes that of the opercular apparatus, and the cranium becomes more compact. Of the branchial apparatus there remains the first, the mandibular, the second, the hyoid, and a part of the third, which fuses with the hyoid. Finally, the axis of the cranium curves. The curve is first considerable in reptiles and birds and reaches its maximum in man. See SKULL; for the anatomy of the bones of the ear, see EAR; and for that of the dental apparatus, see TEETH.

**The Appendicular Skeleton.** Appendages in vertebrates may be divided into two kinds: (1) paired, and (2) unpaired or median. Paired appendages are represented by the lateral fins of fishes and the legs and wings of higher ani-

mals. Unpaired appendages are confined chiefly to fishes and occur in the sagittal plane dorsally, posteriorly, and ventrally. Certain deep-lying structures which support the appendages must be considered in connection with them. The origin of the appendages is a much disputed question. Two views, however, have gained currency. That of Gegenbaur depends wholly upon anatomical evidences; that of Balfour, Dohrn, and others is based wholly upon embryological evidence. Gegenbaur's theory is that the shoulder and pelvic girdles have each been derived from one gill arch and that the appendages are modified gill rays—the bony processes of the gill arches, supporting the gill membrane. Now in such a gill arch one frequently finds one of the middle gill rays much more highly developed than the others. Sometimes on this larger ray lateral rays arrange themselves. From this latter condition, which occurs in *Ceratodus*, may be derived and explained the skeleton of the limbs of fishes and of all the higher vertebrates. The girdles have been derived from gill arches. The theory of Dohrn rests almost wholly upon the evidence afforded by ontogenetic development. The muscles which enter the arm are not derived from one mesodermal somite, but from a number (10 to 30), and as each gill arch corresponds to one metamere, the appendages cannot be derived from gill arches and their rays. Moreover, the muscles of the appendages are derived from the dorsal muscle plates and those of the branchial arches from the lateral plates of the head; hence the musculature of the two is derived from entirely different sources. Dohrn believes the limbs have arisen from a continuous fin, which is paired anteriorly, but fuses posteriorly to form an unpaired ventral fin that extends up over the tail to the mid-dorsal line. By a failure of the development of a part of this continuous fin two paired ventral fins appear, as well as median or unpaired ventral, caudal, and dorsal fins. The evidence for this Dohrn finds in the fact that masses of muscles are constricted off from the muscle plate in the interappendicular region just as at the appendages; these muscles later degenerate. Dohrn also finds muscle masses given off in each somite to the median fin. Hence the median fin is to be regarded as derived from two fused lateral fins.

The paired appendages of vertebrates fall into two types: (1) that of fishes, and (2) that of higher vertebrates. We may distinguish in each case two parts: an axial, the girdle, and a peripheral, the free appendage. It seems probable that the free appendage was developed first, and that the girdle arose from the necessity of a firmer axial support. The skeleton of the fins of fishes is composed of bone, whereas in selachians it is cartilaginous. The plan of the formation of the anterior and posterior appendages of higher vertebrates is the same, and the remarkable correspondence of their anterior and posterior limbs is to be accounted for by force of similar conditions, for in none of the existing fishes are fore and hind limbs alike. A striking instance of a loss of parts as well as of fusion of parts occurs in the wing of the bird (q.v.), where are present a humerus, a radius and ulna, and two separate carpal bones only. The metacarpals are represented by two bones fused at their extremities and by a small bone on the radial side. Still distal to these are two rows of bones, one composed of two pieces and one of one piece only. The fossil bird *Archæopteryx*

had three fingers. The fourth and fifth phalanges have dropped out entirely or are inextricably fused with the other cartilages. In mammals two toes, the third and fourth, remain in artiodactyls (ox, etc.), and in perissodactyls (horses) only one, the third, persists, but in fossil horses (q.v.) all intermediate stages from a five-toed condition have been discovered. In man a number of cases of supernumerary parts (polydactylism) occur. This is a highly inheritable character, regarded by Gegenbaur as a monstrosity, but by Bardeleben considered as a case of atavism. Such a six-fingered condition is found in the adult in some amphibians and reptiles and also in a rodent (*Pedetes*). The human carpals are eight in number, arranged in two rows. The tarsal bones are seven in number.

The pectoral girdle arises ontogenetically later than the free appendages. In mammals, however, this part is characterized by a reduction in the ventral pair of pectoral girdle bones, which may result in their entire absence. The coracoid is lost wherever the movement of the arm is restricted to an ambulatory one, since in carnivores and ungulates the clavicle is wanting. In such mammals as use their forefeet for digging, flying, or feeding the clavicle persists. In man the outer surface of the sternum is provided with a prominent ridge, the "spine of the scapula," which runs out into a prominent process, the acromium. See PELVIS.

The human skeleton is composed of 200 distinct bones, exclusive of the 32 teeth and the ossicles in each tympanum. It is divided into four regions: (1) the skull, composed of 22 bones; (2) the trunk, composed of 54 bones; (3) the upper extremities, composed of 64 bones; and (4) the lower extremities, composed of 60 bones.

SKELETON

For Key and Description, see Text.

der *Anatomie des Menschen* (7th ed., 2 vols., Leipzig, 1899); Thomas Dwight, *Clinical Atlas* (Philadelphia, 1907); J. E. S. Frazer, *Anatomy of the Human Skeleton* (ib., 1914). See ANATOMY; BONE; CARTILAGE.

**SKELETON CONSTRUCTION.** See BUILDING, *Skeleton Construction*; STREET.

**SKELLIGS**, THE A group of rocky islets off the southwest coast of Ireland (Map: Ireland, A 8). They belong to the County of Kerry. Great Skellig rises 714 feet and has two light-houses and the ruins of a monastery.

**SKELLY.** A fish, the common British chub. See CHUB, and Plate of CARPS AND ALLIES.

**SKELTON**, JOHN (?1460-1529). An English satirical poet, born probably in Norfolk. He claimed to have studied at both Cambridge and Oxford, from each of which he received the academical honor of laureate. Some time before 1500 Henry VII appointed him tutor to Prince Henry, afterward King Henry VIII; and Erasmus, in allusion to his learning, styled him "a light and honour of British literature." At this time Skelton had produced some translations and had written elegies on Edward IV (1483) and the Duke of Northumberland (1489), to which was later to be added (1509) a poem on the death of Henry VII. He entered the Church in 1498 and became rector of Diss in Norfolk. Shortly after, he struck into that vein of original vernacular poetry for which he is noted: a flow of voluble verse, unrestrained satire and jocularity, and a profusion of grotesque imagery mixed with Latin and colloquial (East-Anglian) phrases. For a jingling and ludicrous effect he employed short lines, varying from four to six syllables and running on rhymes sometimes repeated seven times over. Caxton said that Skelton improved the English tongue. Very graceful are many passages in a long allegorical poem entitled *The Garlande of Laurell*, such, e.g., as the ballad on Margaret Hussey. Noteworthy, too, is *The Boece of Court*, an early allegory on the right to rations at the King's table. Humorous pictures of low life are contained in *The Tunnyng* [or brewing] of *Elynour Rummynge*, an alewife at Leatherhead in Surrey. This poem was highly popular and often reprinted. His best satires are *Colyn Cloute*, which gave suggestions to Spenser, and *Why Come ye not to Courte?* The former is a general satire on the clergy, and the latter a furious attack on Cardinal Wolsey, from whom the poet had not received expected preferment. The angry Cardinal ordered his libeler to be arrested, but Skelton took sanctuary at Westminster under the protection of Abbot John Islip. In this retreat Skelton remained till his death. Skelton wrote three morality plays, of which only *Magnyfycence* has survived. In the development of the English drama it occupies an important place. Of Skelton's many other lost pieces *A Balade of the Scotyshe Kyng* was discovered in 1878, and it is certainly one of the earliest extant ballads. It was reprinted by J. Ashton in 1882. Skelton was not the author of the jests and merry tales which have circulated under his name. His free verse and allegory had marked influence on Sackville, Spenser, and other Elizabethans. His works were collected in 1568 and reprinted in 1736. The standard edition is by Alexander Dyce (2 vols., London, 1843). Consult W. F. Gray, in *Poets Laureate of England: Their History and their Odes* (London, 1914).

**SKELTON AND BROTON.** A manufac-

turing town in the North Riding of Yorkshire, England, 10 miles southeast of Middlesbrough. It contains an ancient and interesting church of early English architecture and Skelton Castle, the family seat of the Barons de Brus (Bruce), the ancestors of the famous line of Scottish Kings Bruce. It exports large quantities of stone from the neighboring quarries. Pop., 1901, 13,260; 1911, 15,194.

**SKENE**, skēn, ALEXANDER JOHNSON CHALMERS (1837-1900). An American gynecologist, born in Fyvie, Aberdeenshire, Scotland. He graduated in 1863 from the Long Island College Hospital, where he became professor of gynecology in 1872 and where he was dean of the faculty from 1886 to 1893. In this latter office he greatly increased the clinical facilities of the college. He wrote on subjects connected with his specialty.

**SKENE**, PHILIP (1725-1810). See article on the village of WHITEHALL.

**SKENE**, WILLIAM FORBES (1809-92). A Scottish historian. He was educated in Germany and at St. Andrews. Apprenticed to an uncle, he became a writer to the signet (1832) and followed his profession in Edinburgh for 40 years. He was also until 1865 clerk of the bills of the Court of Session. In 1881 he became historiographer royal for Scotland. Skene was one of the most thoroughly equipped Celtic scholars of the time, and as an historian he ranks among the first that Scotland has produced. His principal works are *The Highlanders of Scotland* (1837; 2d ed., 1902); *The Four Ancient Books of Wales* (1868); and, his chief work, *Celtic Scotland* (3 vols., 1876-80). Besides these works and numerous papers Skene also edited *The Chronicles of the Picts and Scots* (1867), *The Chronicles of John Fordun* (1871), and Bishop Reeve's edition of Adamnan's *Life of Saint Columba* (1874). Consult his *Memorials of the Family of Skene* (Aberdeen, 1887) and *Proceedings of the Society of Scottish Antiquaries* (Edinburgh, 1892).

**SKEPTICISM** (from *skeptik*, OF., Fr. *sceptique*, from Gk. *σκηπτικός*, *skeptikos*, inquiring). A term applied in philosophy to any system whose predominant attitude is that of doubt. The objects of doubt may be various, but the most common objects of doubt in skeptical systems are the existence of a world of reality transcending experience (metaphysical skepticism) and the possibility of a valid knowledge (epistemological skepticism). As, however, doubt as to metaphysical reality in the last resort rests on suspicion of man's ability to know anything about such reality, all skepticism is ultimately epistemological, i.e., it rests upon views as to the scope and validity of knowledge. The Sophists (q.v.) of the fifth century B.C. were for the most part skeptics. Gorgias (q.v.) declared that all statements are false, and the reason he gave was that a true judgment is an expression of absolute identity; this contention may be illustrated by an insistence that no man is good, for the simple reason that every man is *man*, and only *good* is good. Gorgias even went further and argued that there is nothing (nihilism), adding that if there were anything it could not be known (skepticism), and even if it could be known it could not be taught. Protagoras (q.v.) of Abdera taught that all we could know is our perception of things, but not things. Man is the measure of the knowable universe. After the

constructive work of Socrates, Plato, and Aristotle, it was natural that skepticism should by reaction take a more definite stand, and this it did in Pyrrho and his school, which was the first to receive the name of skeptics. Pyrrho's main thesis was that things are inaccessible to our knowledge and hence it is becoming in us to suspend judgment. Timon, Pyrrho's pupil, carried skepticism to its logical conclusion, which of course is contradictory to and yet necessitated by the premise from which it is drawn. This premise is that equally good reasons can be given for any proposition and for its contradiction. This principle applied to the doctrines of skepticism themselves involves the result that as good reasons can be given for an antiskeptical as for a skeptical view. This result of course takes away all reasonable advantage which the doubter may claim to have over his opponent, and the only course left for him is to give expression to his suspense of judgment by silence on the subject of skepticism. The Middle Academy, of whom Arcesilaus (q.v.) and Carneades (q.v.) were the most prominent leaders, were somewhat less radical in their skepticism; they had the logical grace to have some doubts as to the truth of a skepticism that doubted everything. Anesidemus (q.v.) elaborated 10 reasons for skepticism and called them tropes. Agrippa and Sextus Empiricus (q.v.) were other noted skeptics of antiquity. In the Middle Ages Algazel in Arabia and Duns Scotus (q.v.) in Europe joined a philosophical skepticism with an unswerving religious faith. With the Renaissance the influence of ancient skepticism began to show itself in the writings of such men as Montaigne (q.v.), Sanchez, and Charron (q.v.), but modern skepticism did not find its adequate expression till Hume (q.v.) wrote his celebrated *Treatise of Human Nature* (1739). In book I of this work is to be found the conclusion which Hume draws from his previous speculations, and not even those experiences of life which have a practical import here escape the touch of doubt. Kant (q.v.) and Spencer (q.v.) are skeptics with regard to ultimate reality. We know the phenomenal world, but the world of things-in-themselves (Kant) or the absolute (Spencer) is unknowable. This dogmatic skepticism is at the present day called agnosticism (q.v.). In theology skepticism is used to designate the attitude of doubt towards the fundamental tenets of religion, such as the existence of God and the immortality of the soul. See KNOWLEDGE, THEORY OF.

**SKERRYVORE.** A dangerous rock in the Atlantic Ocean, 12 miles southwest of the island

of Tiree of the Inner Hebrides. A large lighthouse was with great difficulty constructed here in 1838-44. See LIGHTHOUSE.

**SKETCH-BOOK, THE.** A collection of tales and sketches of travel by Washington Irving (1820) under the name Geoffrey Crayon. Best known are "Rip Van Winkle" and "The Legend of Sleepy Hollow."

**SKETCH-LEY, ARTHUR.** See ROSE, GEORGE.

**SKIAGRAPHY.** See X RAYS.

**SKIEN, skën.** A town of south Norway, on the Skiens Elv, 62 miles southwest of Christiania (Map: Norway, D 7). It has a handsome town hall and has been substantially rebuilt since a fire in 1886. It has cotton, flour, and saw mills and manufactures wood pulp, paper, furniture, and chemicals. There is a copper mine in the neighborhood, and the chief exports are ice, timber, wood pulp, and copper. Skien is the birthplace of Ibsen. Pop., 1910, 11,870. In 1915 its boundaries were extended, making the estimated population 16,000.

**SKIFF, FREDERICK JAMES VOLNEY** (1851-1921). An American museum director and authority on expositions, born at Chicopee, Mass. After several years' service on the *Denver Tribune* he became its manager in 1881. While a member of the Colorado Legislature (1885-86) he became interested in mining conditions. In 1889 he was made Commissioner of Immigration and Statistics, and in 1891-93 was chief of the Department of Mines. He was a director of important exhibits in the expositions at Chicago (1893), Nashville (1897), Paris (1898-1901), St. Louis (1901-05), and San Francisco (1915); and of the Japanese Exposition for 1917. In 1894 he became the director of the Field Museum of Natural History, Chicago. He was decorated by many foreign governments.

**SKIING, skë'ing, Norw. pron. shë'ing** (from Norw. *ski*, from ONorse *skip*, snowshoe billet of wood, AS. *scid*, OHG. *scît*, Ger. *Scheit*, billet of wood). The method by which the inhabitants of Norway, Sweden, parts of Russia, and parts of North and South America propel themselves over snow. The ski is, in fact, the Norseman's snowshoe, differing from the American Indian snowshoe in having its bearing surface of solid wood and not a webbed frame.

The antiquity of the ski is very great. The runners are made of ash, white pine, or hickory. As to the length an expert (Caulfield) lays down this rule: "When you are standing with your arm stretched at full length above your head, the ski, placed upright, should be at least long enough for its tip to reach the roots of your fingers; it may well reach a few inches beyond the finger ends." The width should be from about 2¾ inches in the narrowest part, where the foot rests, to 3¾ inches at the front bend, and the thickness should be from 1¼ inches to ¾ of an inch. The toe end of it is sloped gradually upward to avoid obstacles and narrows to a point at its extreme limit. A shallow groove about ¼ of an inch deep and 1 inch wide is cut in the under surface or *pallo*, as it is called; this forms a slender ridge in the snow and prevents slipping. Sometimes the *pallo* is left bare; sometimes it is covered with skin, the hair on which acts as a grip in climbing hills; and sometimes with horn, which facilitates its down-hill glide. Midway on the top of the skin is a strap or laced thong called the binding, with which the foot is held in position, and generally a heel strap is used. Special

shoes are worn made of thick soft leather, pointed and bent upward at the toes so as to fit the loop or binding. The rider carries a *stav*, a strong wooden stick with a small wheel at the trailing end, by which he starts himself and steers. The motion differs from the step of the Indian snowshoe; it is a glide, zigzagging up hill, and a slide or shoot down hill.

Both in Norway and America skiing is the occasion of gatherings for competition. In America the first ski club was formed in Minneapolis in 1881 and others soon followed. In 1890 a national association of clubs was organized for the regulation of the annual tourneys, called the Ski Association of the Northwest. Great ski contests are held at Holmenkollen and Frognerstøtten, near Christiania, Norway, in February each year, with contests in long and short distance skiing runs and jumping. The long-distance run is generally about 20 miles, round trip. The jump is from a take-off erected midway down a hillside, and when the sliding skiman reaches it he stoops, rises in the air, and must, to be successful, land on his feet and retain equilibrium to the end of the course. Experts will cover in this leap from 130 to 140 feet, and in 1914, at Marquette, Mich., Axel Hendrickson performed the remarkable feat of turning a complete somersault in a jump of 110 feet, retaining his footing. At the tournament at Steamboat Springs, Colo., on Feb. 18, 1916, Regnar Omtvedt, of Chicago, broke all previous world records for long jumps, clearing 192 feet, 9 inches. The previous record was made in 1915 by Amle Omundsen, near Christiania, Norway, and was 177 feet. Consult: W. R. Rickmers, *Skiing* (New York, 1909); J. H. W. Fulton, *With Ski in Norway and Lapland* (London, 1911); Vivian Caulfield, *How to Ski* (3d ed., New York, 1914).

**SKILFISH.** See COALFISH.

**SKIMBACK.** A local name in the Mississippi valley for a fish, one of the most common of the carp suckers (*Carpiodes cyprinus*), otherwise known as sailfish, quillback, etc.

**SKIMMER, or SCISSORBILL.** A sea bird of the genus *Rynchops*, related to the gulls, remarkable for having a bill of a straight, compressed, unequal form. The common skimmer of the North Atlantic (*Rynchops nigra*), which occurs in late summer as far north as the Bay of Fundy, is about 19 inches long, spreading its wings 44 inches, and is black above and white below, with the legs and webbed feet red, and the bill orange and black. It breeds along coasts after the manner of gulls and is confined to the tropics in winter. When feeding the bird flies to the ocean surface, the bladelike lower mandible under water, and plows the water, skimming up its food. Two other species are Asiatic.

**SKIMMERTON.** See CHARIVARI.

**SKIM MILK.** The fat-free liquid remaining after the cream has been removed from milk by skimming. It contains all of the original constituents of the milk except the fat. The average composition of separator skim milk is: water 90.1, ash 0.7, casein 3.8, milk sugar 5.2, and fat 0.2 per cent. It is largely used for feeding young animals and is valuable as a human food. The product is often dried and used in the form of milk powder. Several preparations are made by separating and drying the casein, which are used for human food, for glazing paper, for cheap paint, for making buttons, and otherwise

in the arts. Milk sugar is also made from skim milk.

**SKIN** (Icel. *skinn*; connected with OHG. *scintan*, *scindan*, Ger. *schinden*, to flay). Considered in its general physiological and histological relation, the skin is merely a part of the great mucous system to which the mucous membrane and secreting glands also belong, and which consists of two essential elements—a basement tissue, composed of simple cutaneous membrane, and an epithelium of nucleated particles resting on it, while beneath the basement membrane are vessels, nerves, and connective tissue. (See EPITHELIUM; MUCOUS MEMBRANE.) In the skin the hard and thick epithelium is termed cuticle or epidermis, and the true skin below it is termed the derma, corium, or cutis vera, and is chiefly formed of modified, dense connective tissue.

The external surface of the skin formed by the cuticle is marked by furrows of different kinds. Some (termed furrows of motion) occur transversely in the neighborhood of joints, on the side of flexion; others correspond to the insertion of cutaneous muscles; while others, of quite another kind, are seen in aged and emaciated persons and after the subsidence of any great distention of the integument; and, besides these coarse lines, most parts of the skin are grooved with very minute furrows, which assume various courses in relation to one another. These furrows are most distinctly seen on the palm side of the hand and fingers and on the sole of the foot. The outer surface of the skin also presents innumerable pores for the discharge of the contents of the sweat and fat glands; and the modifications of epidermis known as hair and nails occur on the same surface. The epidermis is composed of stratified epithelial cells united to each other by a cement substance. Its thickness varies from 0.08 to 0.12 of a millimeter. The outermost layer is known as the stratum corneum, composed of several strata of dry, horny scales, without nuclei. Beneath this lies the stratum lucidum, a thin, clear, transparent layer of horny cells with faint nuclei, and next beneath lies the stratum granulosum (or rete mucosum, or rete Malpighii), which overlies and dips into the spaces between the papillæ of the corium. The Malpighian layer is composed of many strata of nucleated cells, which are flattened in the superficial layers, but polyhedral in the deep portion. The pigment of the skin is found in the rete Malpighii.

The deep layer of the skin consists of connective tissue, in which both the white and yellow fibrous elements occur in varying proportions; unstriped muscular fibre is present in some parts of the skin. Where great extensibility with elasticity is required, the yellow (elastic) element predominates; and where strength and resistance are specially needed, as in the sole of the foot, the corium is chiefly composed of a dense interweaving of the white (inelastic) element. The skin is thicker on the hinder surface of the body than in front and on the outer than on the inner sides of the limbs. It is unusually thin over the flexures of the joints and very delicate in the eyelids, while somewhat so in other situations where great mobility is demanded. In regions most subject to external pressure, as the soles of the feet, it is firmly united by very dense laminae to the subcutaneous fascia; and the intervals between these are provided with pellets of fat, forming a cushion, as an addi-

tional protection to the organs it covers. On the external surface of the cutis the tactile papillæ, or organs of touch, are developed. They are most abundant and largest in the palm of the hand and the sole of the foot and occur as small, semitransparent, flexible elevations, usually conical or club-shaped in form. In one square line (a line being  $\frac{1}{2}$  of an inch) of the palm of the hand it has been calculated that there are 81 compound and from 150 to 200 smaller papillæ, arranged in tolerably regular rows.

The glands occurring in the skin are the sudoriferous or sweat glands, the sebaceous or fat glands, and the ceruminous glands. The sweat glands exist almost everywhere in the human skin—in small pits in the deepest portions of the true skin and sometimes entirely below the skin. Their size and number in different regions of the skin determine the amount of perspiration yielded by each part; they are nowhere so much developed as in the axilla or armpit. In that part of the region which in the adult is covered with hair, they form a reddish layer, about  $\frac{1}{8}$  of an inch thick. They are soft and flattened by their pressure on one another, being embedded in delicate connective tissue and covered and permeated with a network of capillaries. Under the microscope such a gland is seen to consist of a solitary tube, one end of which is closed and hidden within the glandular mass, while the other emerges from the gland. The wall of the tube consists of an outer or basement membrane, with which the blood vessels are in contact, and an epithelium, lining the interior, the former disappearing when the tube reaches the surface of the papillæ. The duct, on leaving the gland, follows a rather spiral direction through the reticular portion of the cutis to the interval between the papillæ, when it becomes straight, and it again assumes a spiral course in perforating the cuticle.

The sebaceous glands are small whitish glands in almost every part of the skin except the palms and soles and especially abundant in the scalp, face (the nose being particularly rich in them), and about the anus. They are usually connected with the hairs and consist of a duct terminating in a blind pouchlike or pear-shaped extremity. The basement membrane of these glands is lined by an epithelium in the particles of which are included granules of fatty or sebaceous matter, which, having become detached, constitutes the secretion. These glands are the habitat of the parasite known as *Acarus folliculorum*.

The ceruminous glands are brownish simple glands, in external appearance like the sudoriferous glands, occurring in the cartilaginous portion of the external meatus of the ear. They yield an adhesive bitter secretion which protects the deeper structures from the access of dust, insects, etc.

As a protective covering, the skin possesses the combined advantages of toughness, resistance, flexibility, and elasticity; the connective framework being the part which mainly confers these properties, although the epidermis is also a factor. The subcutaneous layer of fat and the modifications of epidermis in various forms, as hairs, wool, feathers, scales, etc., serve for the preservation of warmth and occasionally (when they occur as claws, talons, etc.) as means of offense or defense. Besides preserving warmth the skin has also the power of re-

ducing body temperature by the evaporation of sweat. The skin is the seat of a twofold excretion, viz., of that formed by the sudoriferous glands and that formed by the sebaceous glands. The fluid secreted by the sudoriferous glands is usually formed so gradually that the watery portions of it escape by evaporation as soon as it reaches the surface; but in certain conditions, as during exercise, or when the external heat is excessive, or in certain diseases, or when the evaporation is prevented by the application of a texture impermeable to air, as, e.g., oiled silk, or India-rubber cloth, the secretion, instead of evaporating, collects on the skin in drops. Since the sweat contains urea, lactates, extractive matters, etc., and the amount of watery vapor exhaled from the skin averages two pounds daily, the importance of the sudoriferous glands as organs of excretion is manifest. The secretion of the sebaceous glands is a semifluid oily mass, which often solidifies into a white viscid tallow-like matter on the surface or in the glandular ducts, from which it can be removed by pressure, in a form resembling that of a small worm or maggot.

The skin is, moreover, an organ of absorption. Mercurial preparations, when rubbed into the skin, have the same action as when given internally. Potassio-tartrate of antimony, when rubbed into the skin in the form of ointment or solution, may excite vomiting or an eruption extending over the whole body; and many other illustrations might be given. The effect of rubbing is probably to force the particles of the matter into the orifices of the glands, where they are more easily absorbed than they would be through the epidermis. The skin has the power of absorbing water, although to a less extent than occurs in thin-skinned animals, such as frogs and lizards. Lastly, the skin possesses a respiratory function, giving off carbon dioxide and taking up oxygen in small quantities. In thin-skinned animals, such as the frog, the excretion of carbon dioxide through this channel is very active. Consult W. S. Kirkes, *Handbook of Physiology* (8th Am. ed., rev. by C. W. Greene, New York, 1914), and R. D. Maurer, *The Skin: Its Care and Treatment* (5th ed., Chicago, 1911).

**SKIN DISEASE.** A morbid condition of the skin, occurring as a local disorder or as a local symptom of a constitutional disease. Skin diseases are classed according to the anatomical manifestations or the pathological relations involved. Maculæ include spots which do not disappear on pressure, such as freckles, moles, and birthmarks. Exanthemata include rashes in which there are eruptions of spots variously grouped, red, inflammatory, and fading on pressure, as in measles, roseola, purpura, and urticaria. Papulæ are pointed or rounded elevations with or without change of color. Tubercles are solid elevations of the cutis of various sizes. Vesicles are small blebs containing fluid, such as occur in eczema, miliaria, or varicella. Bullæ are larger vesicles, seen in pemphigus. Pustules are vesicles containing purulent fluid. Furfura is the term given to branlike scales, easily separable, as in dandruff. Squamæ are scales of larger size than furfura. Scabs, or crusts, are collections of mottled epidermis, exudation, dust, and blood or pus, of varying tint and thickness. Skin diseases are largely classified according to the existence of the characteristics above named. They are separately treated in this work. Con-

sult: O. S. Ormsby, *Practical Treatise on Diseases of the Skin* (Philadelphia, 1915); J. F. Schamberg, *Diseases of the Skin and the Eruptive Fevers* (3d ed., ib., 1915); R. P. White, *Occupational Diseases of the Skin* (New York, 1915).

**SKIN GRAFTING.** In cases of extensive destruction of the skin, leaving large sores that do not heal, and also in treating old ulcers, small particles of skin, cut from the patient or another person, are placed upon the raw surface. Here they soon become attached and grow, forming a number of small islands or patches of skin over the surface of the ulcer; these in time spread till all is covered. Four methods of skin grafting are used. Reverdin's method, proposed in 1869, consists in transplanting small isolated grafts of epidermis about the size of a pin's head, which are deposited in little depressions made with a knife on the granulating surface. From these minute islands epidermization spreads until the entire surface is covered. Wolfe's method consists in removing the entire thickness of the skin and transplanting it to the desired situation; while Krause's method modified Wolfe's graft in that it does not include the subcutaneous fat. The method of Thiersch, advocated in 1874, consists in the transplantation of only the superficial layers of the skin and is the one now generally employed. See RHINOPLASTIC OPERATION.

**SKINK** (from Lat. *scincus*, from Gk. *σκιγκος*, *skinkos*, sort of lizard). A small lizard (*Scincus officinalis*) of the sandy deserts of North Africa and southwestern Asia. It is from 6 to 8 inches long, reddish dun in color, with darker transverse bands, a wedge-shaped head, and four strong limbs that give it extraordinary swiftness. It has been in great repute for imaginary medicinal virtues and is esteemed in the East, dried skinks finding a ready sale. It represents the pleurodont family Scincidae, whose genera and species are scattered over the world, exhibiting many variations, five, four, three, or two toes distinguishing species even within the same genus. An aberrant and curious form is the Australian *Trachysaurus*, illustrated on the Plate of LIZARDS (q.v.). A few true skinks of the genus *Mabouia* dwell in tropical America, but the small swift lizard frequently so called in the northern United States (see FENCE LIZARD) is not of this family. Consult Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901); R. L. Ditmars, *Reptiles of the World* (New York, 1910); E. G. Boulenger, *Reptiles and Batrachians* (ib., 1915).

**SKINNER, CHARLES RUFUS** (1844- ). An American educator. He was born in Oswego Co., N. Y., and attended the Clinton Liberal Institute. He was a member of the New York Assembly (1877-81) and of Congress (1881-85). From 1895 to 1904 he was New York State Superintendent of Public Instruction, having previously been deputy superintendent for six years. In 1897 he served as president of the National Education Association. In 1906-11 he was assistant appraiser at the port of New York. He wrote: *New York Question Book* (1890); *Manual of Patriotism for the Schools of New York* (1900); *The Bright Side* (1909).

**SKINNER, JOHN** (1721-1807). A Scottish poet, born at Balfour in Aberdeenshire, where his father was a schoolmaster. He was educated at Marischal College, Aberdeen, and thereafter

passed several years as a teacher in parish schools. Abandoning Presbyterianism, in which he was brought up, he was appointed in 1742 Episcopal minister at Longside in Aberdeenshire, where he passed his life. Owing to his Jacobite sympathies during the excitement of 1745, his church was destroyed. He published several theological and controversial works, and, notably, an *Ecclesiastical History of Scotland* (1788). It is by his songs, however, that he is remembered. Burns ranked *Tullochgorum* as "the best Scotch song ever Scotland saw," and he praised the pathos of *The Bwie wi' the Crookit Horn*. Consult Skinner's *Theological Works* (3 vols., Edinburgh, 1809), with a biography by his son, John Skinner, and his *Songs and Poems* (ed. by H. G. Reid, Peterhead, 1859). Individual songs appear in T. H. Ward, *English Poets* (New York, 1894-1903), and in similar collections.

**SKINNER, OTIS** (1858- ). An American actor, born in Cambridge, Mass. He appeared as an amateur actor and reader while living at Hartford, Conn., but his professional debut was made in Philadelphia in 1887 as Jim in *Woodleigh*. After playing a two-year engagement there with the Walnut Street Stock Company he went to New York (1879) and won instant recognition by his talent, acting successively with Edwin Booth and Lawrence Barrett in important rôles. In 1884 he joined Augustin Daly's company, with which he remained the next five years, appearing in New York, London, Paris, and Berlin. From 1892 to 1895 he was leading man with Madame Modjeska. In later years he starred in *Kismet* and other romantic plays, with a change in the season of 1915-16 to a character comedy *Cock o' the Walk*.

**SKIP.** In music, a term denoting the progression of a part by an interval greater than a second.

**SKIP/JACK'**. 1. An oceanic fish (*Scomberosoma saurus*) of the family Scomberosomidae, called also Saury and billfish, and in Great Britain skipper and garonook. The body is elongated, with the snout drawn out into a long bill. The scales are minute and deciduous. It is 18 inches long and found in temperate waters of the North Atlantic. The sauries travel in great schools and when pursued by larger fishes often leap and skim the water surface for great distances. The flesh is good. See Plate of NEEDLEFISH, PIKES, ETC. 2. A fish (*Pomolobus chrysocloris*) of the Mississippi valley, let into the Great Lakes through canals and known there as blue herring. It is closely related to the alewife (q.v.), is about 12 inches long, and is a brilliant blue above, with silvery sides. It is not good food, being too bony. It is also taken in deep water in the Gulf of Mexico. 3. The bluefish (q.v.). 4. The cutlass fish (q.v.).

**SKIPJACK** or **SNAPPING BEETLE**. See **CLICK BEETLE**.

**SKIPPER.** A butterfly of the family Hesperiidae. The skippers are usually rather small, but have stout bodies with an especially strongly developed thorax. Their wings are short but powerful, and the butterflies are very erratic in movement. Both sexes have six legs adapted to walking. The family comprises more than 2500 species, of which over 200 occur in the United States. The caterpillars are cylindrical and smooth, with large globular heads. The name "skipper" is also applied to the cheese

maggot or cheese hopper, larva of *Piophilæ casei*. See CHEESE INSECTS, and Colored Plate of BUTTERFLIES, AMERICAN.

SWALLOW-TAILED SKIPPER.

a, butterfly, or bean-leaf roller (*Eudamus proteus*); b, caterpillar; c, chrysalis in rolled-up leaf.

**SKIPPING SPIDER.** See WATER SPIDER.

**SKIPTON.** A market town in the West Riding of Yorkshire, England, on the Aire, 15 miles northeast of Burnley (Map: England, E 3). It is the centre of a large cattle and sheep raising district and has manufactures of cotton and woolen goods and a considerable quarrying industry. It has an old castle, a church in the late Perpendicular style, and a grammar school of the sixteenth century, restored in 1877. Pop., 1901, 12,000; 1911, 12,977.

**SKIRMISH** (OF., Fr. *escarmouche*, It. *scaramuccia*, formerly *schermuzio*, skirmish, from *schermire*, to fence, fight, from OHG. *scirman*, Ger. *schirmen*, to shield, defend, from OHG. *scirm*, *scerm*, Ger. *Schirm*, shield, shelter; probably connected with Gk. *σκίρον*, *skiron*, parasol, *σκιά*, *skia*, shadow, Skt. *chāyā*, shadow). Irregular engagements between small bodies of combatants are usually described as skirmishes, and a company or a battalion of infantry extended so as to cover a wide front is said to be in skirmishing or extended order. The art of skirmishing (see PATROL) is a most important branch of the infantry soldier's training and difficult to acquire. It enables contact with an enemy with a low percentage of loss. Skirmishing makes the individual the unit; consequently much depends on the intelligence and resourcefulness of the individual soldier. In the United States the squad is the basis of extended order, and men are trained to regard the squad as the unit from which they must never be separated, or, if their squad is broken up, to place themselves with the nearest group and to act under the orders of its leader. Before advancing to the attack infantry is deployed in a skirmish line, the normal interval between skirmishers being one-half pace, resulting practically in one man per yard of front. See TACTICS, MILITARY; PATROLS.

**SKIRRET**, *skir'et* (probably a corruption of *sugar root* or *sugar wort*), *Sium sisarum*. A perennial plant of the family Umbelliferae, a native of China and Japan, cultivated for its tuberous, clustered, sweet, succulent roots, used like salsify and also to make a spirituous liquor. The root, sometimes 6 inches long, and  $\frac{3}{4}$  of an inch thick, is propagated by sowing seed, division, or by offsets. In Europe it is highly esteemed.

**SKIRT DANCE.** A spectacular performance in which the dancer wears a very full skirt of light material, so that, grasped by the fingers, it may be waved in accord with rhythmical motions of the body. The steps are less important than the movement of body or limbs and the convoluted and graceful skirt effects. Sometimes wands are used. The skirt dance was made popular in England by Kate Vaughan and was developed there and in the United States by Sylvia Grey, Letty Lind, Topsy Sindon, and others. In 1897 Loie Fuller, famous as a danseuse in both America and Europe, introduced the modification of the skirt dance known as the serpentine dance, and later the fire dance, and she has had many imitators.

**SKITTAGETAN**, *skit'tā-gū'tan*. A North American Indian linguistic family. See HAMP.

**SKITTLES** (variant of *shittle*, *shuttle*, from AS. *scōtan*, OHG. *sciozan*, Ger. *schieszen*, to shoot; ultimately connected with Skt. *skand*, to leap, Lat. *scandere*, to climb). A sport similar to bowling. The nine pins are set in the same pattern at the end of an alley, but are much heavier, weighing nine pounds each. The ball, which is of a different pattern from that used in bowling, is in the shape of a flat cheese rounded at the edges and usually weighs from 12 to 14 pounds. It is cast at the pins and not rolled. No hit counts which is caused by a rebound of the ball from the alley's side. Each skittle fairly downed counts one. It is a game considerably played in Great Britain in the agricultural districts, but in the eastern counties the usual number of pins is four, one at each angle.

**SKLALAM**, *sklāl'am*. See CLALLAM.

**SKOBELEV**, *skō'be-lyēf*, MIKHAIL DMITRIVITCH (1843-82). A Russian general. He entered a guard regiment in 1861 and fought with renown against the Polish insurgents in 1863. As a member of the general staff he was sent in 1869 to Samarkand, and in 1873 commanded a column in the Khiva expedition. Two years later he led the cavalry in the expedition against Khokand and after the city had surrendered pursued the fleeing Khan and took him prisoner. He was made major general in 1876 and placed over the newly organized Province of Ferghana. As commander of a division in the Russo-Turkish War he stormed Lovatz (Sept. 3, 1877) and fought bravely around Plevna, which he occupied on December 10, after the defeat of Osman Pasha. He led the Russian advance over the Balkans and on Jan. 9, 1878, with Generals Mirski and Radetzky, captured the Turkish forces in the Shipka Pass, proceeding thence to Adrianople. In 1880 he was once more in Turkestan to help suppress the marauding Tekké tribes and achieved a brilliant feat in the storming of Gök-Tepe (Jan. 24, 1881). In the same year he was made Governor of Minsk and became prominent as an ardent advocate of Pan-slavism. He died at Moscow, July 8, 1882.

**SKODA**, JOSEPH (1805-81). An Austrian physician, born at Pilsen, Bohemia. After studying in Vienna and practicing in Bohemia, he was detailed in 1833 to the Public Hospital in Vienna, where he became chief physician (1841) and professor in the clinic (1846). He was elected to the Academy of Sciences in 1848. In 1871 he retired. His *Abhandlung über die Auskultation und Perkussion* (1839; 6th ed., 1864) marked a new epoch in diagnostics, by demonstrating the principle that the physical

symptoms observed in a patient only indicated certain physical conditions in his organism, whereupon it devolved upon the rational physician to draw his conclusions as to the real internal disease from his pathologic-anatomical experience. This was in opposition to the French doctrine, until then prevalent, which interpreted the physical symptoms immediately as the signs of a definite process of disease.

**SKOKOMISH**, skō-kō'mish. A tribe of Salishan stock (q.v.) formerly occupying both sides of Hood's Canal on Puget Sound, Washington, and now gathered upon a small reservation near Union, within their own limits. In characteristics they resembled the neighboring Nisqualli and Puyallup (qq.v.), excepting in language. The women were expert in weaving hair cloth, mats, and baskets. The men usually went naked, the women wearing a skirt of twisted strands. In war the men had helmets of cedar bark with body armor of quilted elkskin or strips of wood. Scalping was not practiced. Head-flattening was universal. At death, slaves were sacrificed according to the rank and wealth of the deceased, these frequently being starved or tied to the corpse and left to perish. The great ceremonial was the potlatch (q.v.). The Skokomish have now decreased to 195.

**SKOPLIE**, skōp'lyē. See **USKUP**.

**SKOPTSY**, skōp'tsi (Russ., eunuchs). A Russian religious sect practicing castration. Instances of this practice occur at an early period, but the movement increased at the middle of the eighteenth century. In 1772 Catharine II severely punished the leading heretics. This movement reached its height in 1871 under Lisin, "second Redeemer and Tsar Peter III"; he was sent to Siberia in 1876, and prosecutions have been continued since. The Skoptsy have emigrated in masses, chiefly into Rumania.

**SKOWHEGAN**, skou-he'gan. A city and the county seat of Somerset Co., Me., 18 miles north of Waterville, on the Kennebec River, here spanned by two bridges (Map: Maine, C 4). It has a public library, a fine court house, Somerset Hospital, and Coburn Park. There are manufactures of woolen and worsted goods, shoes, sash and blinds, canned corn, foundry and machine-shop products, etc. It is important as a shipping point for dairy products. Pop., 1900, 5180; 1910, 5341. Skowhegan was incorporated as Milburn in 1823. It received its name, the old Indian name for the place, in 1836. Consult Hanson, *History of the Old Towns of Norridgewock and Canaan, comprising Skowhegan* (Boston, 1849).

**SKRAM**, skrām, PEDER (c.1500-1581). A Danish naval hero and Senator, whose popular nickname was "Denmark's Dare-devil." He was born near Horsens in Jutland. For his services in the war with Sweden (1518-20) he was given an estate in Norway, then under the Danish crown. During the "Count's War" he reorganized the Swedish fleet for Gustavus Vasa, then an ally of the Danish King Christian III, and with it operated successfully against the Hanseatic naval forces. In the political disturbances brought about by the reformation and other causes, Skram—now a senator—was one of the leaders who destroyed the German influence at the Danish court. He resigned his commission as admiral in 1555 on account of ill health, but in 1562 was induced to take command of a large fleet against the Swedish forces, which he defeated and drove behind the Sker-

ries. Skram and Trolle made Denmark supreme on the northern seas.

**SKREFSRUD**, skrāfs'rōod, LAARS OLSEN (1840-1910). A Norwegian missionary and philologist. He was born in Faaberg, Gudbrandsdal, and died in Santalia, India. He was early a mechanic. He taught himself English, French, German, Latin, and Greek, and went to Prochnow's Mission School in Berlin; then after learning Hindustani he was sent by the Goszner Mission in 1863 to the Kol people of India. With H. P. Børresen, from Denmark, he later founded Ebenezer Station among the Santals (1867). His lectures in London attracted wide attention, and Santal committees for his support were formed in England, Norway, and Denmark. He visited America in 1894-95. As a missionary he enjoyed unusual success. His genius for languages is shown by his *Grammar of the Santhal Language* (1873), his translation of the Bible into Santali, with Bodding, and his great *Santhali-English and English-Santhali Dictionary* (1904), on which he worked 35 years.

**SKRIABINE**, skryä'bēn, ALEXANDER. See **SCRIBINE**.

**SKRINE**, skrēn, NESTA HIGGINSON (MRS. WALTER SKRINE; pen name Moira O'Neill) (?- ). An Irish poet, whose work was a part of the so-called Irish Literary Revival. (See **IRISH LITERATURE**, *Irish Literature in English*.) Her poetry breathes the very spirit of the peasant life in Antrim, and is genuinely Irish in its mingled pathos, wit, and humor. Of an old Ulster family, Mrs. Skrine was born NESTA HIGGINSON. She married Walter Skrine, and lived for a time with him on a ranch in Canada, but both of them subsequently settled in Ireland. Her poems, which originally appeared—most of them—in magazines, were collected in *Songs of the Glens of Antrim* (1900). In prose she wrote *An Easter Vacation* (1893) and *The Elf-Errant* (1895).

**SKU'A** (Norw. *skúa*, Icel. *skúmr*, *skúfr*, *skua*), or **JAEGER GULL**. A gull (q.v.) of the subfamily Stercorariinae, in which the nostrils open beneath the edge of a horny cere and other structural peculiarities exist, sufficient, in the opinion of some ornithologists, to entitle this group to family rank. These birds are rapacious, attacking and annoying terns and small gulls and compelling them to drop fish they have already taken. The Antarctic species strike down living birds as hawks do. They are about 20 inches long and about 4 feet in extent of wings, with plumage dusky above and usually white below. Consult Edmund Selous, *A Bird Watcher in the Shetlands* (New York, 1905).

**SKULL** (Icel. *skál*, bowl, cup; connected with AS. *scale*, Eng. *scale*, bowl, balance, cup, and with AS. *secalu*, *secale*, OHG. *scala*, Ger. *Schale*, husk, scale). The bony framework of the head, divided into two parts, the cranium and the face. In human anatomy it is customary to describe the former as consisting of eight and the latter of 14 bones; the eight cranial bones, which constitute the brain case, being the occipital, two parietal, frontal, two temporal, sphenoid, and ethmoid; while the 14 facial bones are the two nasal, two superior maxillary, two lacrymal, two malar, two palate, two inferior turbinated, vomer, and inferior maxillary. The ossicles of the ear, the teeth, and the Wormian bones are not included in this enumeration. At a very early period of fetal existence the

cerebrum is inclosed in a membranous capsule external to the dura mater and in close contact with it. This is the rudiment of the skull, its cerebral portion thus formed before any indication of a facial part. Soon four or five processes jut from it on each side of the mesial line, grow downward, incline towards each other, and unite to form a series of inverted arches, from which the face ultimately develops. Im-

FIG. 1. SIDE VIEW OF HUMAN SKULL.

1, frontal bone; 2, parietal bone; 3, occipital bone; 4, temporal bone (squamous portion); 4\*, same (mastoid portion); 5, sphenoid bone; 6, malar bone; 7, nasal bone; 8, superior maxillary or upper jawbone; 9, inferior maxillary or lower jawbone.

perfect development or ossification of these rudimentary parts of the face gives rise to peculiarities known as harelip (q.v.), cleft palate, and in extreme cases to the form of monstrosity termed cyclops, in which, from absence of the frontal processes, the two orbits form a single cavity, and the eyes are more or less blended in the mesial line. See MONSTROSITY.

The succession of events that occur in the normal development of the skull is as follows: cartilage is formed at the base of the membranous capsule, which has been already described as thrown round the brain and capable of enlarging with it. This is followed by the deposition of osseous matter at various points of the capsule, which soon becomes converted into flakes of bone, affording protection for the brain, while the intervening portions, which remain membranous, permit the skull to expand as its contents enlarge. The formation of these bony flakes on the convexity of the cranium is followed by the appearance of osseous nuclei in the cartilage at the base, corresponding to the future occipital and sphenoid bones. Lastly,

FIG. 2. TOP VIEW.

1, anterior fontanel; 2, posterior fontanel; 3, sagittal suture; 4, coronal suture; 5, lambdoid suture; 6, parietal bone; 7, two halves of the frontal bone, still ununited; 8, occipital bone.

the various bones, some originating in membrane and some in cartilage (see OSSIFICATION), approach one another by gradual enlargement and

become united in various ways, forming a continuous and ultimately an unyielding bony case for the defense of the brain, for the accommodation of the organs of special sense, and for the attachment of the ligaments and muscles by which the skull is supported and moved on the spine. At birth most of the principal bones have grown into apposition with their neighbors, forming the sutures; but one large space remains at the meeting point of the parietal and frontal bones, which is termed the anterior fontanel, and which does not close till the second year after birth or even later. There are two fontanels in the mesial line, as shown in Fig. 2, and two lateral fontanels on each side.

After the sutures have been formed and the skull has acquired a certain thickness a process of resorption begins in the interior of the bones, and reduces the originally dense structure to a more or less cellular or cancellated state. The interior thus altered is called the *diploë*, and by this change the weight of the skull is much diminished, while its strength is scarcely affected.

The growth of the skull after the seventh year proceeds slowly, but slight increase goes on to about the age of 20. The skull bones are freely supplied with blood from arteries which pass from the dura mater internally and the pericranium externally through numerous foramina.

The base of the skull seen from within presents on each side three fossæ, corresponding to the anterior and middle lobes of the cerebrum and to the cerebellum. These fossæ are marked, as is the whole skullcap, by the cerebral convolutions, and they contain numerous foramina and fissures which give passage to nerves and blood vessels. The external or outer surface of the base of the skull, considered from before backward, is formed by the palate processes of the superior maxillary and palate bones; the vomer; the pterygoid and spinous processes of the sphenoid and part of its body; the under surface of the temporal bones; and the occipital bone. The hard palate is formed by the palate processes of the superior maxillary bone.

The anterior region of the skull, which forms the face, is of irregularly oval form, the bones so arranged as to inclose the cavities for the eyes, nose, and mouth, and to give strength to the apparatus for masticating food. The size of the face and the capacity of the cranial cavity stand in inverse ratio one to another, as may be seen by comparing vertical sections (through the mesial line) of human and other mammalian skulls; and if, in place of mammalian skulls, we take skulls of lower vertebrates (the crocodile, e.g.) this ratio is far more striking. In man the face is at its minimum as compared with the cranial cavity, chiefly in consequence of the facial bones being arranged in a nearly vertical manner beneath the cranium, instead of projecting in front of it. The human face is also remarkable for its relatively great breadth, which allows the orbits for the reception of the eyes to be placed in front instead of on the sides of the head, and renders their inner walls nearly parallel, thus contributing, through the parallelism of the optic axes, to that accurate vision which results from the ready convergence of the eyes upon every object. For description of the orbit, see ORBIT (of the eye); of the nasal cavities, see NOSE.

The different varieties of mankind present

certain well-marked and characteristic peculiarities in the form of a skull. Three typical forms of the skull seem to be well established from comparison of a large number of crania—the prognathous, the pyramidal, and the oval or elliptical cranium. When the upper jaw slopes forward the insertion of the teeth, instead of being perpendicular, is oblique. A skull with this peculiarity is prognathous or prognathic, the opposite condition being termed orthognathous or orthognathic. The negro of the Guinea coast and the negrito of Australia present the prognathous character in its most marked form. The pyramidal shape is characterized by the breadth and flatness of the face, which, with the narrowness of the forehead, gives this appearance to the head. The Mongolian and Eskimo skulls belong to this type. The oval or elliptical type is that which is presented by the natives of western or southern Europe, and is not distinguished by any particular feature so much as by the absence of the longitudinal projection of the first type, or the lateral projection of the second, and by a general symmetry of the whole configuration. For the skull as a basis of classification in anthropology, see ANTHROPOMETRY.

The Morphology of the Skull is the highest and most difficult problem of comparative anatomy. Huxley destroyed the archetypal theory, previously held by Owen and others, and established the newer theory on sure grounds of actual observation. Taking first the unsegmented cranium of a skate or dogfish, with its appended jaws and arches, we find that in development, though the notochord extends into the region of the head, the vertebrae stop short of it; but that on each side of the cranium there arise a pair of cartilaginous bars, the *trabeculae* or rafters of the future skull; three pairs of cartilaginous capsules, nasal, ocular, and auditory, form round the developing sense organs; the nasal capsules unite with the ends of the *trabeculae*, which are meanwhile uniting below and growing up at the sides to form the brain case. The auditory capsules become united with the *trabeculae* by the appearance of two new masses of cartilage, the *parachordals*. The first pair of a series of seven or more arches develops an ascending process, becoming the palatopterygoid arch or upper jaw. The second pair of arches, the hyoid, is modified to support the jaws, while the rest are modified to support the gills. In the bony skulls of higher vertebrates the chondrocranium and subjacent arches develop in the same way. The bones originate in two distinct ways: either by actual ossifications or by the ossification of overlying derma, known as cartilage bones and membrane bones respectively, the latter corresponding to the dermal bones and teeth of ganoid and elasmobranch fishes. In mammals the ends of the mandibular and hyoid arches lose their suspensory function, are taken into the interior of the ear capsule, and are metamorphosed into the auditory ossicles. See SKELETON.

Fracture of the Skull may take place either in the vault or at the base. In the vault the fracture is usually direct, the bone giving way at the point at which it was struck, and the result being either a simple fissure or a breaking of the bone into several fragments (a comminuted fracture). Although fractures may be limited to the outer or to the inner table of the skull, they most commonly extend through the

whole thickness, and the broken bone is generally driven inward; and the most ordinary form of fracture with depression is that in which several fragments of a somewhat triangular form have their points driven down and wedged into each other, while their bases remain on a level with the surrounding bone. Fracture of the vault may be easily overlooked. Fissures involving the whole thickness of the bone occasionally exist without ever having been suspected during life, and even an extensive and comminuted fracture, with great depression of the fragments, may escape notice when hidden under the temporal muscle or under great extravasation of blood. When the fracture is accompanied by a wound leading down to the bone, it may, in general, be easily detected. With regard to treatment, it is now an established rule that simple fractures of the skull with depression and without symptoms are to be let alone. The depression may be so marked as to be easily detected; and yet so long as there are no symptoms operative interference is, as a rule, to be avoided. If, however, there be a wound leading down to the bone in a depressed fracture without symptoms, operative measures may be called for. When a depressed fracture is accompanied by primary brain symptoms an operation for the purpose of raising or removing the depressed fragments is usually necessary. Cases occasionally occur in which urgent symptoms of cerebral pressure, such as unconsciousness or convulsions, persist for a long time and are relieved at once on the pressure being removed.

Fractures of the Base may be direct or indirect, but in most cases are indirect, i.e., the bones give way at a point remote from the seat of the blow. At certain parts, however, the bones of the base are so thin that if direct pressure be brought to bear upon them they readily give way. Thus scissors, slate pencils, knitting needles, and other objects have often been thrust into the skull through the orbits or the nostrils and have given rise to wounds which are very serious because of the readiness with which the brain may be injured and bacteria introduced. The only symptoms that can be depended upon as indicating a fracture of the base of the skull are connected either with an escape of the substance of the brain, or blood, or watery fluid, or with an injury done to the nerves as they emerge at the base. Bleeding from the mouth or nose or from the ear occurs in about half the cases. A copious watery discharge from the ear was formerly regarded as a diagnostic sign of fracture of the base. Operative interference is very seldom required in these fractures. Consult: Harrison Allen, "Clinical Study of the Skull," in Smithsonian Institution, *Miscellaneous Collections*, vol. xxxiv (Washington, 1890); Heinrich von Eggeling, *Physiognomie und Schädel* (Jena, 1911), containing a bibliography; L. B. Rawling, *Surgery of the Skull and Brain* (Oxford, 1912); also general works on comparative anatomy and physiology.

**SKUNK** (from Abenaki *segunku*, Cree *see-cawke*, skunk). A fur-bearing mammal of the genus *Mephitis* of the weasel family (Mustelidae), approaching the badgers in the lengthened claws of the forefeet, in the plantigrade hind feet, in dentition, and in habits. Skunks are found only in America, distributed in many species from northern Canada to Patagonia. They are of moderate size, with long hair, bushy.

tails, and black and white markings. All have nocturnal habits and are noted for excessive development of the anal glands, common to most of the family (see BADGER; POLECAT; ETC.), from which an acrid fetid discharge may be projected to a considerable distance. The best-known species to which the name ordinarily refers are the common skunks of eastern North America (*Mephitis mephitis* and *putida*), which are numerous from New England and Canada, nearly as far to the north as timber grows, south to Virginia. The body is about 18 inches long and the tail about 9 inches, but considerable variation occurs, and females are always smaller. In the United States and Canada, as a whole, nine species, comprising 18 forms, are recognized.

Skunks are wholly terrestrial and live in dens and burrows, usually of their own excavation. They are sluggish in movement and usually show little fear of human beings. Although chiefly nocturnal, they are often seen in the daytime. They hibernate only during the severest part of the winter. Five to seven young are born in May in the north. Their food consists largely of mice, reptiles, insects, and birds' eggs. In many parts of the United States they destroy the white grubs, a great pest in lawns and meadows. They occasionally rob the poultry yard, but this is offset by their destruction of noxious mammals and insects. Skunks have been trapped for furs ever since the settlement of the country by white men, and attempts have been made to breed them in confinement, meeting with some success. The fur is sometimes sold under the name "Alaska sable." Apparently there is but one molt in a year, occurring in late summer or in autumn.

That which particularly distinguishes skunks from other animals is their means of defense—the ejection of a malodorous fluid, speedily discouraging the boldest aggressor. The fluid is secreted by two anal glands like those possessed by other members of the Mustelidae, but larger and more muscular. They lie one on each side of the rectum and are embedded in a dense, gizzard-like mass of muscle, which serves to compress them so forcibly that the contained fluid may be ejected to the distance of 15 feet. Each sac is furnished with a single duct that leads into a prominent, nipple-like papilla that is capable of being protruded from the anus and by means of which the direction of the jet is governed. This liquid causes acute distress when in contact with mucous membrane, as, e.g., the eyes.

The skunks west of the plains are divided into several species, that of the northwest being *Mephitis hudsonica*. In the southern and western United States and throughout Mexico occur also small striped skunks of another genus (*Spilogale*), marked with four narrow stripes breaking into spots and crossbars on the rump; these are called zorillos in the Spanish-speaking countries. Still another well-known form is the conepate, mapurito, or white-backed skunk (*Conepatus mapurito*), which is found from Arizona throughout Central and South America.

**SKUNK CABBAGE** (so called because of the fetid odor), *Symplocarpus fetidus*, or *Spathyema fetida*. A plant of the family Araceae, growing in bogs and moist ground from Nova Scotia to Florida and west to Missouri and Minnesota. The hooded, shell-shaped, rather fleshy, variegated purplish spathe appears in earliest spring before the smooth, radical, ovate, heart-shaped leaves. All parts of the plant, especially when bruised, emit a fetid skunkish odor. The fruit, which ripens in September, is a roughened globular mass 2 or 3 inches in diameter. In the northwestern United States, extending through Alaska to Japan and Siberia, is a related plant (*Lysichiton camtschatcense*),

SKUNK CABBAGE.

Leaf much reduced as compared with spathe.

which from its resemblance to the above is also called skunk cabbage. The name given the skunk cabbage by Linnæus was *Dracontium fetidum*; however, the name *Dracontium* is now given to a genus of about a dozen species of tropical aroids which have somewhat similar flowers, but a very different habit of growth.

**SKUNK PORPOISE.** The bay porpoise, so called on account of its variegated black and white markings. See PORPOISE, and accompanying illustration.

**SKUNK TURTLE.** The musk turtle, or musk tortoise (q.v.), so called in reference to its vile odor.

**SKUPSHTINA**, skupsh-tě'nā (Serv., assembly). The name of the Servian national parliament. See SERVIA.

**SKUTARI.** See SCUTARI.

**SKY.** See ATMOSPHERE; CLOUD; DUST.

**SKYE**, skī. The second largest of the Scottish islands and the most northerly of the inner Hebrides (q.v.), forming part of the County of Inverness, from the mainland of which it is separated by a narrow channel (Map: Scotland, B 2). Area, 535 square miles. Skye has mountain and moor, but contains arable and pasture land. The Coolin Hills stretch irregularly from southwest to northeast, culminating in the peaks of Scoor-nan-Gilleann (3167 feet) and Scoor

Dearg (3233 feet). The most famous scene in this region, immortalized by Sir Walter Scott in the *Lord of the Isles*, is Loch Coiruisg, a fresh-water lake near the end of the Bay of Scavaig. Glen Sligachan has fine Highland scenery. The coasts abound in extensive fisheries of herring and cod, and lobster catching is also carried on. Sheep raising engrosses almost exclusively the attention of the farmers. The island produces a well-known breed of pet dog. The principal exports are cattle and sheep, wool, fish, shell fish, and eggs. There are manufactures of tweed at Portree and of whisky at Carabost. The principal port of Skye is Portree, a picturesque village. Among the famous castles are those of Armadale and Dunvegan. Pop., 1901, 14,642; 1911, 14,278, chiefly Celtic, with a mixture of the Norse element. The common language is Gaelic. Consult: Smith, *A Summer in Skye* (Edinburgh, 1885); A. P. Abraham, *Rock-Climbing in Skye* (New York, 1908); James Boswell, *Tour in the Hebrides*, in Everyman's Library (ib., 1909).

**SKYE TERRIER.** See TERRIER.

**SKYLARK.** A European lark (*Alauda arvensis*), the lark (q.v.) par excellence of Great Britain, which, notwithstanding the dullness of its brown plumage, is a universal favorite on account of the sweetness of its song, which it pours forth while flying. More rarely it sings on the ground. It is in great repute as a cage bird and sings well in confinement, fluttering its wings while singing, as if still desirous of liberty. It abounds in open but cultivated districts and is common in most parts of Europe, but from the north it migrates southward before winter. It is a native of Asia and a winter visitant to north Africa. It has been introduced into America and has become naturalized on Long Island. It makes its nest generally in an open field and often under shelter of a tuft of herbage or a clod of earth, lays four or five mottled eggs, and generally produces two broods in a season. It is not gregarious in summer, but in winter large flocks assemble, and at this season many are taken for food in the south of Europe by trapping. See Plate of LARKS AND STARLINGS.

The crested lark (*Alauda cristata*), very similar in size and plumage to the common lark, but having the feathers of the crown of the head more distinctly developed into a crest, although a very common bird in many parts of Europe, has very seldom been seen in Great Britain. The wood lark (*Alauda arborea*), a smaller species, not infrequent in England but rare in Scotland, is a bird of very delightful song and usually sings perched on the branch of a tree. It frequents wooded districts and is also a favorite cage bird. The nearest American representative of these birds is the shore lark (q.v.). Consult J. L. Bonbote, *Birds of Britain* (London, 1907).

**SKYROCKETS.** See PYROTECHNY.

**SKYROS.** See SCYROS.

**SKYSCRAPER.** A popular term to designate a tall office building, such as has become an American type since about 1891. At that time the modern system of steel-frame or skeleton construction began to be developed, first in Chicago, then in New York, making possible edifices of over 10 or 12 stories, the previous limit. The highest of modern skyscrapers is the Woolworth Building of New York, 792 feet high, whose summit is at times actually lost in the low fog

clouds that occasionally settle over the city. See OFFICE BUILDINGS; STEEL SKELETON CONSTRUCTION.

**SLA**, slā. A seaport of Morocco. See SALLEE.

**SLABY**, slā'bē, ADOLF (1849-1914). A German engineer, born in Berlin and educated there. He was instructor at the Royal Industrial School in Potsdam (1873), at the Industrial Academy in Berlin (1876). In 1882 he became professor of the theory of machines and electricity at the Technical Institute in Charlottenburg and (1884) director of the electrotechnical laboratory there. In 1902 he was made professor in the University of Berlin. He wrote: *Versuche über Kleinmotoren* (1879); *Kalorimetrische Untersuchungen über den Kreisprozess der Gasmaschine* (1894); *Die neuesten Fortschritte auf dem Gebiete der Funkentelegraphie* (1901).

**SLADE**, slād, FELIX (1790-1868). An English antiquary, born in Lambeth, then a suburb of London. On the death of his elder brother he inherited the family estate of his mother in Yorkshire, known as Halsteads. In 1866 he was elected a member of the Society of Antiquaries. Slade expended a large fortune in collecting books, bindings, engravings, manuscripts, carvings, glass, and pottery, which were bequeathed to the British Museum, and bequeathed £35,000 for art professorships at Oxford, Cambridge, and University College, London. John Ruskin was the first Slade professor at Oxford. Consult the *Guide to the Slade Collection of Prints in the British Museum* (1869) and the *Catalogue to the Slade Collection of Glass* (London, 1869).

**SLADEN**, DOUGLAS (BROOKE WHEELTON) (1856- ). An English author, born in London. He studied at Trinity College, Oxford, and went to Australia (1879), where he became the first professor of history in the University of Sydney. Subsequently he traveled much and settled in London as a writer. His work includes: *Frithjof and Ingebjorg* (1882); *Poetry of Eoiles* (1883); *In Cornwall and Across the Sea* (1885); *Edward the Black Prince* (1886), an epic drama; *The Spanish Armada* (1888); *The Japs at Home* (1892); *A Japanese Marriage* (1895); *A Sicilian Marriage* (1905); *Egypt and the English* (1908); *The Unholy Estate* (1912); *Twenty Years of my Life* (1913); *Queer Things about Japan* (1913); *The Real "Truth about Germany"* (1914); *His German Wife* (1915).

**SLAG** (Swed. *slagg*, dross, slag; connected with Goth., OHG. *slahan*, Ger. *schlagen*, to strike, AS. *slēan*, Eng. *slay*), SCORIA. Fused compounds resulting from the reduction of a metal from its ores. In fire metallurgy of ores sufficient quantities of materials are added to facilitate the fusing of the nonmetallic elements, which are thus separated from the metals. The fused earthy matter is called slag. It consists of compounds of silica in combination with lime, alumina, or other bases. Some metal usually remains in the slag, and in the early days of smelting so much metal was so lost that many ancient slag piles are being reworked now at a profit. Depending on the composition and rate of cooling slags are glassy, crystallized or stonelike, and earthy. Slags are now utilized in many ways. (See IRON AND STEEL; CEMENT.) Paving and building blocks are molded from it. Railroad ballast and road surfacing utilize much of the supply, while much is also used in making cements. Slags from basic steel proc-

esses contain much phosphorus and consequently are made use of in the production of fertilizers.

**SLANDER** (OF. *esclandre*, *escandele*, *scandele*, from Lat. *scandalum*, from Gk. *σκανδαλίον*, *skandalēthron*, stumblingblock, offense, scandal; connected with Lat. *scandere*, to climb). Defamation committed by speech, either by vocal sounds or by the sign language of the deaf and dumb. English law distinguishes sharply between libel (q.v.) and slander. The latter is "actionable only when special damage can be proved to have been its proximate consequence, or when it conveys imputations of certain kinds." (For enumeration of these special imputations, as they existed at common law, see DEFAMATION.) In England and in many of the United States the oral imputation of unchastity to a female has been declared actionable by statute without proof of special damage.

Although slander is one of the few torts in which malice (q.v.) is an essential element, that term in this connection means only that the defamation must have been uttered without just cause or excuse. Actual ill will on the part of the speaker towards the plaintiff is not necessary, unless the occasion of its utterance was conditionally privileged, as in the case of a statement by a master about the character of a servant made to one whose inquiries he may lawfully answer in good faith.

As slander consists in uttering words to the injury of another's reputation, it follows that they must have been uttered to, or in the hearing of, third persons who understood them. It is not essential, however, that the speaker knew of the presence of the others. Even though they were concealed from him, if they overheard his slanderous words, a case of "publication" by him is made out. Nor is it any defense to one who reports a slanderous statement that he gave the name of his informant and expressed no opinion as to its truth. Of course, the truth of the defamatory matter may be set up as a defense; for the law will not permit a man to recover damages in respect of an injury to a reputation which he ought not to possess. The plaintiff need not prove the falsity of the alleged slander, however, as that is presumed from its defamatory character. Hence, if the defendant does not prove truth as a defense, he may be liable.

It is sometimes difficult to determine whether particular language is slanderous or whether it is only "fair comment." This difficulty is generally one of fact, to be solved by the jury. The rule of law on this topic seems to be: Where a person has done or published anything which may fairly be said to have invited comment, every one has a right to make fair and proper comment thereon. He may freely criticize such acts or publications; but his criticism must be limited to their character and consequences and not directed against the personality of the actor. Consult: Sir Frederick Pollock, *The Law of Torts* (8th ed., London, 1908); W. B. Odgers, *Digest of the Law of Libel and Slander* (5th ed., ib., 1911); M. L. Newell, *Law of Slander and Libel in Civil and Criminal Cases* (3d ed., Chicago, 1914). See DEFAMATION; PRIVILEGED COMMUNICATION; TORT.

**SLANDER OF TITLE.** The disparagement of the property of another to his damage by false and malicious statements. This species of tort (q.v.) took its name from the fact that for a considerable period its only form was that of

disparaging misrepresentations of a person's title to real property. At present it is extended to such statements concerning any property interest. Accordingly a disparaging publication about the quality of a public dinner served by a caterer, or about the age of a race horse, or about the right to use a particular trademark, if false and malicious and causing special damage to the plaintiff, is an actionable slander of title. It will be observed, therefore, that the name has ceased to be really descriptive of the tort. The wrong may be committed without slandering any one and without affecting title to any property, and it is immaterial whether the statement is oral or in writing, except that the damages are likely to be larger in the latter instance.

Not only must the malicious statement cause actual damage, but it must be a statement of fact and not one of opinion merely. Not being an action for injury to the person, slander of title is not subject to the common-law rule that a personal action dies with the person.

**SLANG** (origin uncertain; probably a cant use of the archaic preterite *slang*, regarded as a participle of *sling*, AS., OHG. *slungan*, Ger. *schlingen*, to sling, sling). Colloquial words and phrases originating chiefly in the lower classes of society or in professional jargon. The term may also include words and phrases formally in harmony with the standard usage, but which in meaning diverge from this norm so far as to be generally considered inolegant and vulgar. The importance of slang in the semasiological development of language (see SEMASIOLOGY) is great, for it tends to enrich the language with new words and add new meanings to terms which it already contains. Condemnation of slang, therefore, finds little support from a linguistic point of view. Slang is the radical counterpart of conservative purism, and the two exercise a constant check on each other as a necessary condition to the development of language. It need hardly be added that vulgar slang is to be condemned unsparingly. Slang is furthermore the vocabularistic side of dialect and accordingly governed by the laws controlling dialectic growth. (See DIALECT.) If therefore a given slang expression is found for any reason to supply a need on account of its shade of meaning or its superior convenience over a word in use, it may be adopted, though often on sufferance, into the standard language. The life of the average slang word is short. Such a term may, however, ultimately become recognized even by the most conservative purist and thus lose its character as a slang word, as "blizzard," "skyscraper," and "graft" which, originally slang, are now standard in America.

The basis of slang is metaphor (q.v.). In poker players cash their "chips" at the close of the game. Hence comes the phrase "to pass in his chips," as equivalent to death. Again, a girl, as being plump and of a peachlike complexion, is called a "peach"; or as being dignified and of exceptional beauty, a "queen"; while a clumsy, inept person is named a "lobster." Though such terms, drawn intentionally from slang unrecognized in literature, seem at first sight vulgar, equally violent transfers of meaning have been made in course of time in literary usage. The evolution of the French *tête*, head, from the Latin *testa*, jar (found also in the later Latin poets in the sense of "skull"), is in itself no better than the English "mug" for

"face," yet *tête* is considered standard, while "mug" is regarded as slang. On the other hand, certain words and phrases formerly regarded as strictly literary are now slang, at least in certain collocations. As familiar examples of this may be cited "awful," "fierce," "keen," "wise," in such phrases as "an awful swell," "a fierce hat," "to be keen on something," or "to put a man wise." Not only does the inexact use of the word make it slang, but frequently it seems to be the brevity and commonness of the term which render it objectionable. Akin to this class is the slang of clipped words, as "enthuse" for "make enthusiastic," "beaut" for "beauty," "gent" for "gentleman," etc. The objection to such words seems justifiable on linguistic as well as on aesthetic grounds. A prolific source of slang is euphemism, especially that which is based on propriety. Akin to euphemistic slang are clipped oaths, now little used, though common in earlier English. Examples of these are "zounds," "od's life," "by cock and pie," and in modern usage the rustic oaths "dod rot," "gol darn," "I swan," and the low city form "bully Gee." Another class of slang comes from foreign languages. This enters, as a rule, among the higher circles of society and is therefore wider in vogue and more lasting in vitality. Here belong *fin de siècle*, "up to date," *bon-ton*, "high society," as well as translated expressions, as "to save one's face," i.e., "to preserve one's credit or self-respect in the eyes of others."

Every grade of society and almost every profession has its slang. These varieties are so different as to be almost unintelligible in other circles. The slang of the race course, prize ring, and barroom are distinct from one another and stand in marked contrast to the slang of the cultured classes. Here, again, there are separate slangs for the artist, the actor, the stock-broker, the club man, and the university man. It is in the colloquialisms of the two latter classes, indeed, that slang is found which is not so inconsistent with good taste. Intrinsically there is no reason why one slang should be preferred to another, and it is as proper to speak in low slang of "winning by a neck" or "putting to sleep," or "rushing the growler," as to use the high slang of "a slump in the market," "doing a turn," "skying a picture," or "boning up with a crib for an exam." The only criterion is the exact, intelligible expression of the idea.

Closely connected with professional slang is cant, and the two often overlap so as to be distinguishable only by some arbitrary rule. Cant differs from slang in that it is originally intentionally unintelligible to any but members of the profession, although it may of course spread even into the literary language. Cant, like slang, is of all grades. It ranges from thieves' cant, as "douse the glim" for "put out the light," or "pinch a cove's wad and ticker," for "steal a man's money and watch," through stage cant, such as "see the ghost walk," for "to get one's salary," "angel" for "patron," up to financial cant, as "a flyer in futures," and artists' jargon, as "to chic" for "to sketch from memory," or "to sky a picture" for "to hang it too high in an exhibition."

Among the many minor varieties of slang may be mentioned back, centre, and rhyming slang. Back slang is founded by roughly spelling words backward. Centre slang is more elaborate. The middle vowel of the word to be turned into slang

is taken as the initial letter, followed by the latter part of the original word. To this the first part of the word is added. In rhyming slang a phrase which rhymes with the word to be disguised is substituted, as "apples and pears" for "stairs." The necessity of slang is shown by its universality. Not only is it current in all modern languages, but it is used by the most cultured society, despite puristic attempt to suppress it. It is not a characteristic of modern languages alone, for it abounds in the more popular literature of Greece and Rome, as in the comedies of Aristophanes and Plautus, or in the *Satyrus* of Petronius.

**SLATE** (OF. *esclat*, Fr. *éclat*, splinter, fragment, from OHG. *slitan*, Ger. *schleissen*, AS. *slitan*, Eng. *slit*). A hard fissile rock which has been produced from shale or clay, or more rarely igneous rocks, by metamorphism. This process by means of heat and pressure, aided also possibly by moisture, consolidates the original rock and obliterates the original stratification, developing new lines of parting or cleavage planes along which slate splits easily and in thin layers. Many fine-grained shales which split readily along the bedding planes are erroneously called slate, but true slate is a hard and compact rock, little likely to be acted on by the weathering agencies. Owing to its origin, slate is found only in regions of metamorphic rocks, and therefore its geographical distribution is

somewhat restricted. Its geological range extends from the Cambrian to the Jurassic. Slate is commonly bluish black or gray black in color, but red, green, purple, and variegated varieties are known. In the United States the most important slate quarries are in Maine, Vermont, New York, Pennsylvania, Maryland, and Georgia. A small production is also made in California and Arkansas. The supply of slate in Europe is derived mostly from Wales and France.

Slate is usually quarried in open pits and less rarely by underground workings. The rock splits best when it is green or freshly taken from the quarry. Slate is extensively employed as a roofing material and for sinks, washtubs, billiard-table tops, electrical switchboards, flooring, mantels, blackboards, school slates, pencils, and in acid towers. The tests applied to slate are those of absorption, frost resistance, abrasive resistance, toughness, resistance to acids and electricity, and permanence of color.

Slate is classified as roofing slate and millstock. The latter is made into slabs 1 to 3 inches thick and sold at prices ranging from 4 to 50 cents per square foot.

Roofing slate is sold by the square (the number of pieces required to cover 100 square feet with 3-inch lap), and the price for ordinary No. 1 slate ranges from \$3.50 to \$10 per square.

The value of the slate produced in the United States in 1914 was: roofing slate, \$4,160,832; millstock, \$977,930; other uses, \$568,025. The exports amounted to \$139,125.

**SLATER.** A city in Saline Co., Mo., 12 miles northeast of Marshall, on the Chicago and Alton Railroad (Map: Missouri, C 2). It is in a rich grain and stock-raising region. Pop., 1900, 2502; 1910, 3238.

**SLATER, JOHN FOX** (1815-84). An American manufacturer and philanthropist, the nephew of Samuel Slater, who introduced cotton spinning as an industry in America. John F. Slater was born at Slatersville, R. I., and after an academic training took charge of his father's woolen mill at Hopeville, Conn., and of a cotton mill near by, at Jewett City. In 1842 he removed to Norwich, Conn., and in 1872 became sole owner of the family's mills. He was a liberal benefactor of local institutions, and as his years advanced he determined to set apart \$1,000,000 for the education of the freedmen. (See **SLATER FUND**.) Congress voted him thanks and a gold medal for his benefaction. Consult the *Memorial*, privately printed in Norwich, Conn. (1885).

**SLATER, SAMUEL** (1768-1835). An American manufacturer, founder of the cotton-spinning industry in the United States. He was born in Derbyshire, England. He acquired a thorough knowledge of cotton spinning under Jedediah Strutt, the partner of Richard Arkwright, and in 1789 emigrated to the United States for the purpose of introducing the industry, leaving England secretly for fear at-

tempts would be made to prevent departure. In January, 1790, at Pawtucket, R. I., he entered into a contract to build and equip a mill with spinning machinery like the Arkwright system. After several failures the machinery was completed and the spindles were set to work Dec. 21, 1790. In 1806, with his brother John, he constructed extensive cotton mills on the site of the present town of Slatersville, R. I., accumulating a large fortune there. By 1810 there were in the United States 100 mills in operation, all on the Arkwright system after the Slater models. In 1812 Slater constructed mills at Oxford, Mass., and in 1815-16 erected woolen mills. Consult White, *Memoir of Samuel Slater* (Philadelphia, 1836).

**SLATER FUND.** An endowment established by John F. Slater (q.v.) in 1882 for the encouragement of industrial education among the negroes in the South. In May, 1882, Mr. Slater transferred \$1,000,000 to a board of trustees, incorporated by the State of New York, of which President R. B. Hayes was the original chairman. By good management this fund has almost doubled, and the annual income is at the disposal of the trustees for negro education in the Southern States. Bishop Haygood, Dr. J. L. M. Curry, Dr. Wallace Buttrick, and Dr. James H. Dillard have been general agents of this fund. The trustees have stood for the promotion of normal and industrial training and have given largely to Hampton and Tuskegee institutes and lesser amounts to several kindred and well-managed institutions. Consult L. P. Ayres, *Seven Great Foundations* (New York, 1911), and the annual *Reports of the United States Commissioner of Education* (Washington).

**SLATINGTON.** A borough in Lehigh Co., Pa., 17 miles northwest of Allentown, on the Central of New Jersey, the Lehigh and New England, the Lehigh Valley, and the Philadelphia and Reading railroads (Map: Pennsylvania, K 5). Structural iron, knit goods, and silk are manufactured, and there are fine slate quarries in the vicinity. Settled in 1738, the borough was incorporated in 1864. Pop., 1900, 3773; 1910, 4454.

**SLATIN PASHA**, slät'en pä-shü', BARON RUDOLF CARL (1857- ). An Egyptian soldier, born near Vienna, Austria. He served for a time in the Austrian army, in 1878 entered the Egyptian service under General Gordon, and in 1881 became Governor-General of Darfur. Not long after his appointment to this post the Mahdi began his famous religious war, and in 1884, after the defeat of Hicks Pasha, Slatin was captured by the Mahdists. He became the servant of Abdullahi, who afterward succeeded to power on the death of the Mahdi. After a captivity of 11 years Slatin succeeded in 1895 in escaping to Lower Egypt. Upon reaching Cairo he was made a pasha by the Khedive. In 1900 he was appointed British Inspector General of the Sudan. He wrote *Fire and Sword in the Sudan* in 1896. In 1906 he was made Baron of the Austrian Empire. He was an honorary major general in the British army, but in the latter part of 1914 renounced this and other British honors.

**SLAUGHTERHOUSE CASES.** The term applied to some notable cases decided by the United States Supreme Court at the December term of 1872. The cases came from an attempt of the Legislature of Louisiana to place re-

strictions on the butchery industry in the interest of public health in New Orleans. The restrictions practically amounted to a denial of the right of the general public to engage in that business, and suits were brought on the ground that the statute was an infringement upon the Fourteenth Amendment to the Constitution. The cases were carried to the Supreme Court (q.v.), where it was held by a majority of 5 to 4 that it was not the purpose of the Fourteenth Amendment to deprive the States of their police power—this remained with them unimpaired; that there is a citizenship of the United States and a citizenship of a State, distinct from each other, and that the privileges and immunities belonging to the latter must rest for their security and protection where they had theretofore rested, viz., upon the States.

**SLAUGHTERHOUSES.** The first attempt to regulate the conduct of establishments where animals are slaughtered for food probably was made during the reign of Richard II, for in 1388 an Act of Parliament forbade the casting of offal and other refuse of slaughtered animals into rivers and other waters. During the nineteenth century a national system of municipal slaughterhouses was established in France and Germany and an agitation for a similar system of public ownership was under way in Great Britain and had been established in many towns. This great public improvement originated with Napoleon, who passed a decree in 1807 for the erection of public abattoirs.

In Germany each town council has authority to erect and maintain public slaughterhouses and to forbid the slaughtering of meat elsewhere. It may also provide regulations governing the inspection and sale of meat not slaughtered at public slaughterhouses and may prohibit the importation of prepared meats.

Inspection in England has not been made compulsory by parliamentary enactment, nor has the maintenance of municipal slaughterhouses been authorized. Abattoirs were opened in Edinburgh in 1851 and in Manchester in 1872. Throughout Europe municipal abattoirs are now considered necessary in order that not only the slaughtering of animals, but also the inspection of meat, may be concentrated and regulated.

In the United States the modern abattoir system dates from the middle of the last century, when concentration in meat packing began gradually to supersede the killing of animals on a small scale. This concentration reduced, but did not eliminate, the need for municipal control of abattoirs, whose conduct usually must conform with standards set by local health authorities. The largest packing centres of the country are Chicago, Kansas City, St. Louis, Omaha, etc., all in close proximity to the extensive cattle-feeding areas, because with the improved system of refrigerator cars it is advantageous to ship the dressed carcasses to Eastern markets rather than the live animals to be killed near the point of consumption. In these large abattoirs the division of labor is carried out to a remarkably fine degree, which renders each man extremely expert in his particular part of the work.

The United States since Oct. 1, 1906, when a meat-inspection law took effect, has had the broadest and most stringent Federal inspection of meat and meat products of all countries in the world. The inspectors are located in all abattoirs doing interstate or foreign business, and the regulations against diseased meats are

very rigid. For further information and statistics, see **PACKING INDUSTRY**; **ABATTOIR**. Consult: F. W. Wilder, *Modern Packing House* (Chicago, 1905); J. P. Donovan (Westerner, pseud.), *Handling the Hog* (New York, 1910); O. Schwarz, *Public Abattoirs and Cattle Markets* (Chicago, 1912).

**SLAVE COAST.** A geographical name for a division of the coast of Upper Guinea. It owes its name to the active slave trade formerly carried on there. See **DAHOMY**; **BENIN**.

**SLAVE LAKE.** See **GREAT SLAVE LAKE**.

**SLAVERY** (from *slave*, from OF. Fr. *esclave*, Ger. *Sklave*, slave, Slav; originally referring to Slavs taken by Germans in war). Legally, that status of an individual or individuals characterized by perpetual and almost complete loss of personal and political liberty; socially, an institution defined by law and custom similar to *patria potestas*, *comitatus*, and to vassalage, serfdom, servitude, and apprenticeship in personal and economic subjection, but distinguished from them as the most absolute and involuntary form of human servitude.

The slave is the property, chattel or real, of his master and cannot participate in the civil right of personal freedom, though, except in strict Roman law, he may enjoy limited personal rights. Slavery represents a stage in social or industrial organization and development. It probably coincides with the beginnings of settled agricultural tribal life, but its ultimate origin is in dependence resulting from inequality of capacity or opportunity between individuals or sets of individuals brought into competitive relations. Whether recognized by common, statutory, or international law, slavery is a developing status varying its character in place and time as defined by local law and custom. It existed anciently among Babylonians, Assyrians, Egyptians, Hebrews, Persians, Phœnicians, Greeks, and Romans and in India, China, and Africa. It is interpreted in ancient monuments and literature and locally defined by law. Philosophic justification of slavery, ancient and modern, rests historically upon natural subjection and difference of race or creed, or both. But nationals as well as barbarians, heathen, and heretics have been enslaved by all races. Classical philosophy, Hebrew and other ancient religions, Brahmanism, Buddhism, Christianity, and Mohammedanism sanctioned the institution, but its essential sanction rested in law defining the status and its incidents. Of the chief sources of slavery (capture in war, man stealing, purchase, birth by a slave parent, and action of law), capture was early the most prevalent. Hebrew, Greek, and Roman slavery, recruited from all these sources, more often than modern slavery, applied to a subject the equal or superior of his master. An extensive slave trade with the Mediterranean islands, Asia Minor, Africa, or southern Europe aided to fill Athens, Corinth, Ægina, and Italy with vast numbers of slaves, numbering often thrice the free men. At Sparta conquered *helots*, owned by the state but let to individuals, numbered seven to one Spartan.

The incidents of Greek, Roman, and American slavery are strikingly similar. In each country the slave was sold, hired, seized for debt, and treated as his master's property, chattel or real. He was controlled by whipping, branding, fetters, exile, or by tie of affection to the family. He had customary limited rights of marriage,

property, maintenance, contract, religion, and personal security and sanctuary (in Greece). Post-Homeric Greece, the later Roman Empire, and some American colonies of the eighteenth century legalized his right to life and limb. Previously Roman slaves were "things" in the master's *dominica potestas*, subject to life and death, torture, mutilation, gladiatorial combat, work in mines under drivers, but were, like American slaves, superior to Greek in having greater opportunity to obtain freedom. Greek and Roman freedmen gradually became free men. Classical and American slave labor was prædial, domestic, industrial, clerical, and public. Rome denied slaves civil or military service. Many Greek and Roman slaves entered learned professions. Italian *latifundia* worked by slaves destroyed freehold yeomanry and increased, with harshness, danger of servile insurrection. Serious revolts occurred in Greece and Rome and later in the West Indies, but North America suffered only minor local insurrections, such, e.g., as Gabriel's Insurrection (q.v.) and Nat. Turner's Insurrection. (See TURNER, NAT.) The closing of Roman conquest, *jus naturale*, and Christianity modified the rigid chattel conception of *jus civile* and *jus gentium*, and law gave the slave personality and protection. Finally Justinian enlarged the *coloni*, men personally free but tied to the soil like serfs. Thereafter slavery, the chief labor system since the Punic Wars, though practiced by Rome's Teuton conquerors, was gradually replaced in mediæval Europe by feudal vassalage, villeinage, or serfdom, particularly where German and Roman life came in close contact. Serfdom persisted to modern times, surviving in Russia until 1861. See SERF.

Slavery and the slave trade, continued by mediæval Venice, the Saracens, Tatars, Turks, and African tribes, were freshly extended by Mohammedans in Africa and Asia, who made subject alike Christians, heathen, whites, and blacks. Negro slavery was a long-established African tribal custom with debtors, criminals, vagrants, and captives. The commercial expansion of Portugal began the African slave trade in modern Europe and America. Through kidnapping and from Moorish slavers Prince Henry of Portugal received negro slaves in 1442 and two years later began the European slave trade from the west coast of Africa. For a half century Portugal monopolized the traffic, which finally embraced the Spanish possessions in America, where Indian slavery established by Spain was exterminating the natives. Spain entered the slave trade in 1517, the English (under John Hawkins) in 1553, and France in 1624; they were followed by Holland, Denmark, and the American Colonies. The market was the West-European countries and their colonies in America, particularly the Spanish West Indies. England finally took the lead in the commerce, granting from the time of Elizabeth to 1670 five separate patents for its monopoly to favored merchants and companies. Between 1712 and 1749 the exclusive supply of the Spanish colonies was granted by Spain to the English South Sea Company. Thereafter all Englishmen could enter this field and continue their former trade to the English colonies.

Research has proved that the first negroes landed at Jamestown in 1619 and others brought by early privateers were not reduced to slavery, but to limited servitude, a legalized status of

Indian, white, and negro servants preceding slavery in most, if not all, of the English mainland colonies. Statutory recognition of slavery occurred in Massachusetts in 1641, in Connecticut in 1650, in Virginia in 1661, and later in the other Colonies. Jews, Moors, and Turks were also subjects of Colonial slavery. Indian slavery was confined chiefly to the seventeenth century with the English, as their Indian captives were less profitable than those of the Spanish, who were subjected to more rigorous treatment. Slavery in the region now constituting the United States was patriarchal. Statutory law and court decisions added to such incidents of servitude as alienation, whipping, disfranchisement, limited marriage, trade, etc., first the incident of perpetual service and then a denial of civil and juridical capacity, as well as of marriage, property, and possession of children, thus creating slavery. The slave, contrary to the famous *obiter dicta* in the Dred Scott decision (see DRED SCOTT CASE), had some legal rights, such as limited personal agency, security (after 1788), support in age or sickness, a right to limited religious instruction, and suit and evidence in special cases. Custom gave numerous rights, such as private property, marriage, free time, contractual ability, and to females domestic or lighter prædial labor, which, however, the master was not bound to respect. Barbarities like mutilation, branding, chaining, and murder were regulated or prohibited by law, but instances of cruelty were not infrequent before the nineteenth century.

It was a mooted point in the courts of the former slaveholding States of the United States whether a slave had any rights under the common law which the master was bound to respect. There was very little precedent in the English law, and under the early Roman law a master had absolute power of life and death over his slaves, who were generally captives taken in war. In 1820 a Mississippi court held that under the common law the wanton killing of a slave was murder. In 1851 the Supreme Court of Georgia repudiated the reasoning advanced for the above conclusion, contending that a master had absolute dominion over a slave under the common law. The first legal provision in America on this subject seems to have been a Virginia statute of 1723, making the willful killing of a slave murder. In 1770 a Colonial Act prohibited the malicious and unnecessary killing of slaves by white men. However, in most of the Southern States statutes were enacted prohibiting the wanton killing or mutilation of a slave, thus finally disposing of the question. Slaves were liable under the criminal laws of the States in which they lived. Most of the slave States also passed statutes securing to slaves certain other rights, such as to be treated in a humane manner, to receive medical attention when ill, and to be provided with the necessities of life when from old age or other causes they were unable to work.

With such humane provisions recognition of a slave as a person ceased, and for all other purposes he was regarded as a chattel, subject to the will of his master, and a thing to be bought and sold. The law of personal property was applied in governing his ownership. The children of a slave mother belonged to her owner, irrespective of who owned the father. In most of the Southern States the marriage of slaves was not recognized in law, though perhaps gen-

erally encouraged by slave-owners from religious or moral principles. The question of the legal status and effect of a slave marriage became important after the general emancipation of the slaves in determining the descent and distribution of property of former slaves. Generally, the States in which slavery flourished enacted statutes providing for legalizing such marriages by certain formalities, and in a few States continued cohabitation merely, after emancipation, was held sufficient.

A slave could not hold property, and anything acquired by him belonged to his master. The testimony of a slave would not be received in a civil action in which a white person was a party. However, slaves could testify in a criminal suit in which other slaves were defendants or in actions to secure their freedom. The right of an owner to give a slave his freedom was recognized, and a free negro could hold property.

Sentiment against the increase of the negro population and the slave trade early developed in America. English colonies by numerous statutes from 1695 imposed duties to discourage or prohibit slave traffic, but British merchants and commercial policy defeated these efforts. The enforced slave trade appears in State constitutions, and in the first draft of the Declaration of Independence as a justification of the American Revolution. Virginia by protest in 1772, Connecticut by statute in 1774, and Delaware by her constitution in 1776 attempted to stop the trade, and Virginia by an Act of 1778 was the first political community to prohibit it with efficient penalties. Similar action in nine other States during 1783-89; abolition of slavery in Massachusetts and Pennsylvania in 1780; the desire of John Jay to make prohibition a feature of the Treaty of Paris of 1783: the struggle for prohibition in the Federal Convention, resulting in the compromise limiting the duration of the trade to 20 years, at the end of which period the United States passed the Act of 1807 abolishing it, show the priority and force of American sentiment against the slave trade. Similar sentiment developed in Europe. Denmark by royal order prohibited the trade after 1802 in her possessions. France, following the doctrine of her Revolution, abolished her colonial slavery and slave trade in 1793, but Napoleon soon undid the work of the Convention. Napoleon's Decree of March 29, 1815, however, confirmed by the Treaty of Paris and a Law of 1818, made the trade illegal. In England Dillwyn, Sharpe, Clarkson, and Wilberforce began to organize antislave-trade opinion in 1787. In 1788 Dolben and Pitt moved bills for its regulation or suppression. But mercantile interests repressed the movement until 1806, when the Grenville-Fox ministry secured the passage of acts for the partial abolition of the slave trade, which were followed by an Act on March 25, 1807, for total abolition.

The Jay-Fox entente of 1783 paved the way for the joint pledge of England and the United States, in 1806, to strive for international abolition. This object appears in treaties of England with Denmark, Portugal, and Sweden during 1810-14. France then pledged aid to British advocacy of abolition in the Congress of Vienna. The Netherlands by royal decree in 1814 abolished the traffic. Spain restricted it, and Portugal in 1815 agreed to prohibit it in the Northern Hemisphere. In the Treaty of Ghent the United States and Great Britain again pledged their

endeavors for suppression. The United States by supplementary acts in 1818 and 1819 endeavored to enforce her prohibition. From this time to 1840 England's chief efforts were bent on establishing an international right of search in time of peace to stop the illicit slave traffic, which increased from 40,000 a year in 1820 to 200,000 in 1837. In 1827 Portugal and Brazil promised to abolish the trade in 1829. A second time England interested a European congress, that of Verona in 1822, against the trade, now carried on with 352 ships. England urged a declaration in international law making the trade piracy, but secured, as at Vienna, only a general denunciation of the traffic. The United States and other Powers opposed right of search in time of peace as dishonor to the flag and a means of securing England's naval supremacy. (See SEARCH, RIGHT OF.) Though not a party at Verona, the United States promptly favored international declaration of the slave trade as piracy and prepared a treaty with England to this effect in 1824. But, as England was unwilling to yield her claim to search in American waters, the Senate rejected the treaty and the United States could only urge the international declaration. By 1833 Sweden, France, Denmark, the Hanse Towns, and some Italian states had agreed in part to England's contention for mutual search, but slavery had become such a delicate question in American politics at this time that the United States refused England's proposed concessions. In 1842 the United States and England agreed on joint naval cruising on the African coast to repress the trade. English statutes in 1824 and 1837 made the slave trade piracy punishable by death or life transportation. Conferees of England, France, Austria, and Prussia, in London, in 1838, proposed the Quintuple Treaty of Dec. 29, 1841, declaring the trade piracy and admitting mutual right of search. On account of this admission France refused to ratify, and Lewis Cass (q.v.), the American Minister at Paris, denied its application as international law to the United States. Belgium joined in 1845 in the Quintuple Treaty, and the United States, though refusing England's invitation to an international conference in 1860, completely changed attitude with the advent of Lincoln and Seward, admitted mutual right of search in 1862, and imposed the death penalty on smugglers of slaves. Suppression was organized, but until 1866 required a United States naval squadron on the African coast. The French, Spanish, Portuguese, and United States flags had protected slavers. Northerners sold to Southerners in Florida, Texas, and Cuba, but the Confederacy in 1861 declared against the trade. The Civil War and the Thirteenth Amendment practically and legally completed the extinction of slavery and the slave trade in the United States. The English, inspired by Livingstone, sought to put an end to the slave trade in the Sudan, but the efforts of Baker and Gordon proved ineffective in the face of the Mahdist convulsions. Tewfik, however, prohibited the Egyptian slave trade in 1884. The Powers in the Berlin Conference in 1884-85 promised their efforts for repression, and in 1890 an Act for this purpose resulted from the international conference, including Turkey, Persia, Zanzibar, and the United States, invited by Leopold of Belgium.

The antislavery sentiment and the movement

aimed against the existence of the institution of slavery followed and in many cases coincided with or were affected by those against the slave trade from early colonial duties and taxes to steps for repression and emancipation. Promoted by the same, though a more limited and sometimes excitable public, including distinguished statesmen, authors, humanitarians, and sectarians, the movement originated and first rose to importance in North America and England. Eighteenth-century Christian sentiment, particularly among Friends, encouraged customary and legal manumission and the mitigation of slave codes. Justice Lord Mansfield's decision in 1772 freed slaves, like the negro Sommerset, brought to the soil of Great Britain. English emancipation societies arose in 1783 and French in 1788. Slaveholders like Washington, Jefferson, Henry, Mason, and Madison, and other statesmen, such as Franklin, Hamilton, and Adams, condemned slavery in principle, and emancipation was accomplished or in progress in every Northern State except New Jersey by 1799. Jefferson proposed in 1784 to prohibit slavery in the Northwest Territory, and he also advocated emancipation for Virginia in 1779. Tucker prepared another Virginia emancipation plan in 1796, New Jersey emancipated her slaves in 1804, and Congress limited the slave trade in Louisiana. The movement in its first stage rested chiefly on a moral or an economic basis, but soon became political. American antislavery organizations began from Pennsylvania's petitioning Congress for Federal interference with slavery. Congress denied its constitutional competency to regulate the domestic institution beyond the slave trade; but petitions continued, and the sentiment of the North and South, united in the Ordinance of 1787 (see NORTHWEST TERRITORY), but divided in the Constitutional Convention, was increasingly committed respectively to an antislavery and a proslavery programme. A movement towards united sentiment and national organization to solve the slavery and free negro questions by emancipation and colonization took tangible shape in the American Colonization Society (1816) and its affiliated State societies. (See COLONIZATION SOCIETY.) Though patronized by statesmen and divines, such as Madison, Harper, and Breckenridge, by many slaveholders, and by the Federal government, this movement, which resulted in the establishment of a negro colony in Liberia, was viewed by extreme antislavery men as a proslavery reaction.

From 1818 to 1820 political antislavery sentiment became more prominent, opposing particularly slavery extension. Dissatisfaction in the North with the Missouri Compromise (q.v.) laid the basis of abolitionism. William Goodell with his *Investigator* in Rhode Island, and Benjamin Lundy (q.v.) with his *Genius of Universal Emancipation*, established in 1821, began an antislavery press, while Lundy went on lecture tours and endeavored to found a slave asylum in Texas and Mexico. John Rankin formed an abolition society in Kentucky, and William Lloyd Garrison (q.v.), supported by Arthur and Lewis Tappan, established the *Liberator* at Boston in 1831. The era of expansion and reformation, mechanical, moral, and political, then beginning, favored the increasing antislavery societies and press, such as Griswold and Leavitt's *New York Evangelist* and Goodell's *Genius of Temperance* (1830) and *Emancipator*

(1833), the New England Antislavery Society, founded in 1832, and the New York City and the American antislavery societies, founded in 1833. The last resulted from a National Antislavery Convention in Philadelphia representing every Northern State. These agencies distributed broadcast tracts, books, pamphlets, and business labels denouncing slavery. The abolitionists denounced slavery and slaveholding as crimes, demanded immediate and unconditional abolition without compensation, encouraged breach of slave laws and unconstitutional measures, and affirmed natural equality of persons. Garrison, Lovejoy, Phillips, Gerrit Smith, John Brown, Hutchinson, Storrs, and Birney became their leaders. Channing, Emerson, Bryant, Whittier, Lowell, and Longfellow gave literary and moral support to reasonable antislavery methods, but less conservative men in border free States manipulated an "underground railway" to Canada for fugitive slaves. (See UNDERGROUND RAILWAY.) John Quincy Adams and others fought for the right of petition concerning slavery and constitutional abolition. Southern apologists, such as Dew, Dabney, Smith, and Fitzhugh, answered the polemics culminating in Mrs. Stowe's *Uncle Tom's Cabin* (1852), a protest against the Fugitive Slave Law; and the paper war raged till Lincoln's election assured the antislavery victory and made actual war inevitable. President Lincoln issued his famous emancipation proclamations on Sept. 22, 1862, and Jan. 1, 1863, and the Thirteenth Amendment (1865) practically and legally secured the success of the Abolitionists by Federal abolition.

Great Britain, where Clarkson and Wilberforce had been the most prominent leaders in the antislavery movement, pursued a less radical method of abolition, providing by law in 1833 for future and progressive emancipation in her West Indian colonies and compensating slaveholders by purchase and an apprenticeship subsequently limited to 1839. In 1843 she abolished slavery in India. Sweden followed with colonial abolition in 1846, France in 1848, Holland in 1859, Brazil with progressive emancipation in 1871 and total emancipation in 1888, Spain in Porto Rico in 1873 and in Cuba in 1880, Great Britain and Germany in their African protectorates in 1897 and 1901, the United States in the Philippines in 1902, and Egypt in the Sudan. The South American republics abolished slavery when they emancipated themselves from the yoke of Spain.

Mohammedan countries have been the last to feel this influence, and household slavery exists in Turkey, Persia, Egypt, Zanzibar, Pemba, Tripoli, and Morocco, though everywhere officially prohibited. A considerable traffic still exists in the Congo and Portuguese West Africa, and Nieboer's extensive inquiries disclosed 210 savage tribes in North, Central, and South America, Oceania, Malay Archipelago, and Africa, where slavery exists.

Slavery was chiefly a moral and economic question in the American Colonies, but it appeared as a political one during the Confederation, particularly in the debates of the constitutional and ratifying conventions, when the question of submitting it and other States' rights to Federal initiative arose. The dictum of natural equality and inalienable rights in the Declaration of Independence, even when reappearing in bills of rights, could not be practically applied except in limited cases, as by George Wythe in

Virginia, to the liberation of slaves. But Northern emancipation provisions showed that the economic and social basis in the North was to be increasingly laid in free labor and a farm system contrasting with the slavery and plantation system of the South. Economic and social sectionalism in the Colonial period rapidly became political in the Federal. From 1787 Mason and Dixon's line (q.v.) had political significance; slavery as one of the basal elements of the difference of sectional interests and sentiment rose from a local State question into the most important and permanent in national politics. Controlling conditions were: (1) increasing sectionalism from localization of industrialism in the North; (2) constitutional compromise provisions granting Federal legislation in regard to the slave trade and fugitive slaves, and representation for slaves on the three-fifths basis; (3) a Federal domain increasing by cession, purchase, treaty, and conquest and subject to Federal organization and representation in Congress; (4) the growth of political parties opposed as to constitutional construction; (5) sectionalized antislavery sentiment; and (6) development and expansion of Southern staples adapted to slave labor, especially cotton after the invention of the cotton gin in 1793. The Constitution purposely avoided the use of the terms "slave" and "slavery," yet the bargain of South Carolina and Georgia with commercial New England riveted upon it recognition of the institution. Slavery had thus two connected phases: (1) as to its existence in the States, a State right, a local question, involved in national politics in the general States' rights struggle; (2) as to its existence and extension in Federal territory, a national question, constitutionally subject to Federal legislation. National expansion necessarily brought it into politics. Support of members from the slave States in Congress secured the ordinances of 1784 and 1787, prohibiting slavery in the Northwest Territory and preparing the way for new free States. In 1793 Congress passed almost unanimously a fugitive slave law to secure owners in their property. (See FUGITIVE SLAVE LAW.) The bill abolishing the slave trade renewed sectional debate and showed predominant antislavery sentiment in the North. Between 1803 and 1817 four States, two free (Ohio and Indiana) and two slave (Louisiana and Mississippi), were admitted into the Union, and the theory of balance of power between slave and free States was established. But the further organization of the Louisiana territory in 1818-20 drew the issue sharply on slavery extension. Only temporary political adjustment of slavery followed the Missouri Compromise (q.v.) prohibiting slavery north of lat. 36° 30' N., except in Missouri. From 1820 to 1830 tariff and public land policy were, together with slavery, the issues conditioning the life and expansion of the Southern and Northern economic systems. Nonextension was interpreted as eventual extinction of slavery. Discussion of tariff bills in 1824 and 1828, dogmas of nullification, State rights, and abolition, and the Hayne-Webster debate of 1830 greatly increased the importance of slavery in sectional politics and made it the leading question after the Tariff Compromise of 1833. Antislavery men who believed in attaining their ends through constitutional methods and Abolitionists organized the Liberty party (q.v.), and twice (in 1840 and

1844), nominated J. G. Birney (q.v.) for President. The annexation of Texas in 1845 and the Mexican War in 1846-48 were proslavery victories, the latter adding territory from which the unsuccessful Wilmot Proviso (q.v.) failed to exclude slavery. There now arose over the question of slavery a controversy destined to split both Whigs and Democrats, to bring about new party alignments, and eventually to hasten, if not cause, a great civil conflict between the North and the South. By 1848 Oregon (q.v.) was organized without slavery, and the Free-Soilers, who strove for the exclusion of slavery from the Territories (see FREE-SOIL PARTY; TERRITORIES), had taken the place of the Liberty party. The antislavery cause won in the Compromise of 1850 in free California and slave-trade prohibition in the District of Columbia, but lost in a fugitive-slave law federally executed. (See COMPROMISE MEASURES OF 1850.) Douglas's mistake in the repeal of the Missouri Compromise and his substitution for the arrangement then effected of "squatter sovereignty" by the Kansas-Nebraska Bill (q.v.) in 1854, precipitated a sectional struggle for possession of Territories by colonization and border warfare. (See KANSAS.) The free-State settlers practically won in 1857, and the Republican party, absorbing Anti-Nebraskans, Free-Soilers, Abolitionists, and Antislavery Whigs and Democrats, completed the victory, though the Dred Scott decision opened the Territories to slavery. Cuban annexation, which had been a proslavery policy since 1841, was defeated in 1859, and Lincoln's election following the John Brown raid of 1859 was the signal for the secession (1860-61) of a South jealous of her State rights and resentful of interference in slavery. Congressional acts in 1862 and Lincoln's Emancipation Proclamation in 1863 (a war measure), and the Thirteenth Amendment in 1865 legally destroyed the institution of slavery, while the Fourteenth and Fifteenth Amendments gave freedmen full civil rights.

**SLAVERY, or SLAVES.** A name applied to certain tribes of Déné (q.v.) Indians in north-western Canada, the Etchautine, Thlingchadinne, Kauchodinne, and part of the Nahane. In the first half of the last century the name was often used by fur traders to signify all the Athapaskan-speaking tribes west of the Mackenzie River. Consult Emile Petitot, *Dictionnaire de la langue Déné-Dindjie* (Paris, 1876).

**SLAVIC LANGUAGES.** A branch of the Indo-European or Indo-Germanic languages (q.v.). Among these languages Slavic is most closely connected with the Baltic group (Old Prussian, Lettic, and Lithuanian). The principal characteristics of the Slavic languages are: (1) Disappearance of closed syllables, entailing the loss of final consonants, as OChurch Slav. *domŭ*, house; Russ., Serb., Bulg., Slov., *dom*; Pol. Czech., *dum*; Skt., *damas*; Gk. *δῶμος*; Lat. *domus*. (2) Monophthongization of primitive diphthongs, as Common Slav. *zima*, winter; Gk. *χειμα*; Common Slav. *ucho*, ear; Lat. *auris*. (3) Change of short *i* and *u* into indistinct sounds, *ĭ*, *ŭ*, in O Slav., as OChurch Slav. *vidova*, widow; Skt. *vidhāvā*; Lat. *vidua*. (4) Development of nasal vowels, as OChurch Slav. *pětŭ*, five; Pol. *pieć*; Skt. *pāñca*; Gk. *πέντε*; Lat. *quingue*; Lith. *penki*. (5) Development of the peculiar sound *y* from the primitive *ū*, as OChurch Slav. *dymŭ*, smoke; Russ., Pol. Czech., *dym*; Skt. *dhūmās*; Gk. *θυμός*; Lat. *fūmus*; Lith. *dūmai*. (6) Change of primitive intervocalic *s* into *ch* (*kh*), as Common Slav. *ucho*, ear; Lith. *ausis*; Lat. *auris*; Goth. *ausō*. (7) Change of the palatal *kh* into *s*, *g*, *gh*, into *z*, as (a) *k*; Common Slav. *slovo*, word; Gk. *κλῡρός*; Lat. *in-clutus*; OIr. *cloth*; Skt. *śrutās*; (b) *g*, OChurch Slav. *znati*, to know; Russ. *znat'*, Pol. *znać*; Gk. *γινώσκειν*; Lat. *gnoscerē*; Skt. *jñā*; Goth., *kann*; OHG. *kñden*; OIr. *gnāth*; Lith. *zinóti*; (c) *gh*, OChurch Slav. *azŭ*, I; Skt. *ahám*; Gk. *ἐγώ*; Lat. *ego*; Goth. *ik*. (8) Palatalization of the gutturals *g*, *k*, *kh*, into *ž*, *č*, *š* before palatal vowels *e*, *i*, *ĭ*, *ē* (*ě*), and *y*; later into *z*, *c*, *s*, before *ě* and *i* resulting from primitive *ei*, *oi*, as (a) *ž*, OChurch Slav. *živŭ*, alive; Lat. *vivus*; Gk. *βίος*; OIr. *beo*; Goth. *gius*; Skt. *jīvās*; Lith. *gyvas*; *č*, OChurch Slav. *očese*, gen. sing. of *ok-o*, eye; Common Slav. *oko*; Lith. *akis*; Lat. *oculus*; Ger. *auge*; OChurch Slav. *ušesa*, nom. pl. of *ucho*, ear; Common Slav. *ušt*; OChurch Slav. *bošē*, loc. sing., and *bozi*, nom. pl. of *bogŭ*, God; OChurch Slav. *člověčŭ*, loc. sing., and *člověci*, nom. pl. of *člověku*, man; OChurch Slav. *dušē*, loc. sing., and *duši*, nom. pl. of *duchŭ*, soul. (9) The preservation, to a large extent, of the primitive free accentuation.

The first attempt at a scientific classification of the Slavic languages was made by Dobrovsky (1822), who divided them into a Western and an Eastern group. A later somewhat conventional division is into Eastern, Southern, and Western. At present the following divisions are distinguished in the Slavic group: (1) Russian, with Great Russian, Little Russian, and White Russian branches (see RUSSIAN LANGUAGE;

UKRAINIANS); (2) Bulgarian, with Eastern and Western dialects, and (2a) the Macedonian Slavic, which agrees with it in such important peculiarities as the postpositive article, the preservation of nasal sounds, and the loss of declension; (3) Serbo-Croatian; (4) Slovenian; (5) Czech-Moravian, with its (6) Slovak dialect; (7) Serbo-Lusatian or Sorbian (with the Upper Lusatian and Lower Lusatian dialects); (8) Polish, with (9) Kashubian and Silesian, and the extinct (10) Polabian (these three languages constitute the Liach group); (11) Old Church Slavic (Old Bulgarian), the oldest and in many respects nearest to the Primitive Slavic. It agrees with the Modern Bulgarian in its treatment of *tj* and *dj*.

That the linguistic affinity of the Slavic languages closely corresponds with their geographic relationship there is no doubt in view of such phenomena as the following: (1) *tj* (also *ktj*, *gtj*) becomes *č* in Eastern Slavic, as *světa*, candle, for \**svět-ja*; *št* in Bulgarian, as *svěsta*; *k'* in Macedonian, *svěk'a*; *č* in Serb., as *svěca*; Slov. *svěca*; *c* (= *ts*) in Western Slavic, as Czech. *svíce*; Pol. *świeca*; *dj* becomes *ž* in Russian, as *měza*, boundary line, for \**medja*, cf. Lat. *medius* (= English *j*) in Serb, *meda*; Slov. *měja*, *žd* in Bulg. *mězda*; in Western: *z* in Czech. *miese*; *dz* in Pol. *miedza*. (2) *pj*, *bj*, *vj*, *mj*, become *plj*, *blj*, *vlj*, *mlj* in Russian, as *topljū*, heat, infinitive *topit'*; *ljublju*, I love, infinitive *ljubit'*; *lovlju*, I seize, infinitive *lovit'*; *zemlja*, earth, for \**zemja*; the epenthetic *l* also appears in Serb, Bulgarian, and East Slovenian, while in the Western Slavic the sound *l* is absent. (3) Before *l* and *n*, *t* and *d* fall out in Russian and Southern Slavic, as Russian *plol*, I led, *vel*, I wove, from *pletu*, I lead, *vedu*, I weave; *t* and *d* are retained, however, in certain Slovenian dialects and in Western Slavic. (4) *ar*, *al*, *er*, *el*, become *oro*, *olo*, *ere*, *ele* in Russian, as *boroda*, beard, *golova*, head, *berog*, shore, *peleva*, membrane; *re*, *la*, *rě*, *lě* in Southern Slavic, as *brada*, *glava*, *breg*, *pleva* (*brěg*, *plěva*); in Western Slavic *ra*, *la*, *re*, *le*, as in Czechic, *brada*, *hlava*, *lěh*, *pleva*; *ro*, *lo*, *rze*, *le* in Polish, *brada*, *głowa*, *lżeg*, *plewa*. (5) *gv* and *kr* become *zr*, *sr* in Russian and Southern Slavic, as Russ., Bulg., *zvězda*, star; Slov. *zvězda*; *cvět*, color, flower, Russ., Serb, Bulg., Slov., but remain in Western Slavic, as Czech. *hvězda*, *květ*; Pol. *gwiazda*, *kwiat*. Other illustrations of geographical and linguistic parallelism occur in the treatment of the semivowels *i* and *ū*, which sometimes reappear as *e* in the West, *a* in Serbo-Croatian, *o* and *e* in Russian, with other Slavic languages holding intermediate positions; the softening (palatalization) of consonants, especially dental, when followed by *e*, *ě*, *i*, and *ī* (less intense from North to South); the treatment of nasals; vocal quantity (long vowels appear in Little Russian, Slovak, Polish, Czech, Slovenian, and Serbo-Croatian); the degree of freedom of the accent; etc. The division of the Slavic languages into Eastern, Western, and Southern is based on the conjunction of several of the peculiarities enumerated above. The Slovak comes very near being the connecting link of all the Slavic languages in spite of the fact that it has lost actual contact with most of them. Also Little Russian, though separated by the Rumanian (see RUMANIAN LANGUAGE) wedge from the South Slavic, agrees with the latter as against Great Russian by confusing *i* and *y* and by showing diminished palatalization before *e*.

In morphology we may note the retention of three genders, and in certain languages (as Serb and Slovenian) the presence of the dual and seven cases (loss of the ablative). The Modern Slavic languages, however, show a tendency to simplify the declension by reducing the number of stems and leveling the case endings. Bulgarian has completely lost its declension.

The relation of Slavic declension to the Indo-European may be illustrated by the example of a masculine *o*-stem, *vrānū*, raven. Singular: nominative: *vrān-ū*, Skt. *vrka-s*, wolf, Lat. *lup-us*, Gk. *λύκ-ος*; ablative (coinciding with the genitive in Slavic): *vrān-a*, *vrk-āt*, *lup-ō(ā)*; accusative: *vrān-ū*, *vrk-am*, *lup-um*, *λύκ-ον*; vocative: *vrān-e*, *vrk-a*, *lup-e*, *λύκ-ε*; locative: *vrān-ě*, *vrk-ě*, *Corinth-oi (-ī)*, at Corinth, *οἰκ-οι*, at home. Dual: nominative, accusative, vocative: *vrān-a*, *vrk-ā(-āu)*, *du-o*, two, *λύκ-ω*; genitive, locative: *vrān-u* (for *\*ous*), Russ. *vo-ōčiju*, with one's two eyes, Serb *uši*, with one's two ears, *vrkay-ōs*. Plural: nominative, vocative: *vrān-i*, *lup-i*, *λύκ-οι*; genitive: *vrān-ū*, *vrk-ām* (*-ānām*), *div-ōm*, *λύκ-ων*; locative: *vrān-ěchū*, *vrk-ěchu*, *λύκ-οισι*; accusative: *vrān-u*, *λύκους*, Goth. *sununs*, sons; instrumental: *vrān-y* (for *\*ois*), *λύκοις*, *vrkaiš*, Lith. *vil-kaiš*. The instrumental (all numbers) in *-m* is also found in the Baltic group of languages. Peculiar to the Slavic is the dative singular *vrān-u* (instead of *vrān-ě*), which shows the influence of the *u*-stems.

In conjugation the Slavic verb is well exemplified in the Old Church Slavic. (See OLD CHURCH SLAVIC LANGUAGE AND LITERATURE.) In the syntax perhaps the most striking feature is the use of double negatives: OChurch Slav. *ničtože ne bystī*, nothing happened; Russ. *nikto ne znaet*, no one knows; Pol. *nie nie widzem*, I see nothing. Other peculiarities are the substitution of the genitive for the accusative in nouns denoting animate beings in the singular and plural masculine and in the plural feminine, and the use of the instrumental (instead of the nominative) as a predicate. The possessive pronoun of the third person has usurped the functions of the other two when referring to the subject, in Russian invariably, in Old Church Slavic usually: OChurch Slav. *idi vū domū sroji*, go unto thine house; Russ. *Ya (ty) vidělū svojego brata*, I saw (thou sawest) my (thy) brother.

Those Slavic nationalities which adopted Roman Catholicism use in writing the Roman alphabet with some modifications (see SERBO-CROATIAN LANGUAGE); the Greek Catholic Slavs, however, employ the Cyrillic (q.v.).

**SLAVIC MYTHOLOGY.** The earliest reliable information concerning the mythology and religion of the Slavs before their adoption of Christianity does not reach further back than the eleventh century of our era and is confined to the Baltic Slavs and Russians. From German and Scandinavian sources we learn that the Slavonic dwellers of the lower Elbe and Oder basins worshiped a number of divinities of a military character. Thus, Svarasiz (i.e., Svarozich) was the god of the Lutitians; Svantovit, "the mighty," was worshiped at Arcona, and Triglav, "the three-headed," at Stettin. These divinities had their statues, temples, and attendants and received part of the spoils of battle. The old Russian chronicles state that the Varangian Russ princes took oath by the gods Perun and Volos. When St. Vladimir "began to reign in Kiev, he put on a hill outside his palace yard the wooden Perun with the silver head and golden mustaches, and Khors, Dazhbog, Stribog, Semargl, and Mokosh, and the people brought them sacrifices." Perun may have been a god of thunder like the Scandinavian Thor. Volos, "the beast god," may have been a god of cattle and patron of merchants. In the song of Igor (see IGOR'S BARD, SONG OF) he is said to be the grandfather of bards (*boiany*). Of the other Russian divinities nothing is known with certainty, for the view that they were personifications of natural phenomena is not sufficiently supported by early evidence. It is interesting to note, however, that in an old Russian source Hephaestus is glossed with Svarog and the fire, moreover, is called Svarozich (son of Svarog), recalling the Svarasiz of the Lutitian Slavs. This seems to point to the identification of fire and sun worship. With the advent of Christianity the old gods were regarded as devils. The pagan Russians had medicine men (*vlsvi*) and cremated their dead.

On the whole the survival of old rites and ritualistic customs are the most fruitful source of information on early religion. Ancestor worship, e.g., clearly survives in the *dziady* festivals of the White Russians, while various solstitial and equinoctial rites point to an early Slavonic religion of agricultural magic. Popular belief knows of numerous sprites (*domovye*, *lěsye*, the fairy-like *vilas* of the Southern Slavs), fate and birth divinities (ORuss. *rožanica*; *rodjenice* and *sudjenice* of the Southern Slavs), were wolves (*vlkodlaci*), etc. Nevertheless, many beliefs and practices have been borrowed from the neighboring nations, not a few being introduced along with Christianity. To Christian influence are due the burial ceremony (*marzana*) of the Poles, most of the Christmas ceremonies and practices of the Southern Slavs, belief in devils, witchcraft, relics, etc.

**Bibliography.** The works of A. N. Afanasiev, *Poetic Conception of Nature among the Slavs* (in Russian, St. Petersburg, 1865-69), and Krek, *Einleitung in die slavische Literaturgeschichte* (2d ed., Graz, 1887) are out of date and unreliable. More recent publications are: Jan Máchal, *Outline of Slavic Mythology* (Prague, 1891); L. P. M. Léger, *La mythologie slave* (Paris, 1901), and the excellent article of

Alexander Brückner, "Slavische Religion," in *Die Religion in Geschichte und Gegenwart*, vol. v (Tübingen, 1913); J. A. MacCulloch, "Slavic," in *The Mythology of all Races*, vol. iii, edited by L. H. Gray (Boston, in preparation, 1915). On special topics: Krauss, *Volksglauben und religiöser Brauch der Sudslawen* (Münster, 1890); Anitchkov, *Spring Songs and Customs* (in Russian, St. Petersburg, 1904-05); id., "Old Russian Pagan Cults," in *Transactions of the Third International Congress of Religion*, vol. ii (Oxford, 1908); *Archiv für slavische Philologie* (Berlin, 1876 et seq.).

**SLAVONIA.** The northeastern part of the autonomous Province of Croatia and Slavonia in Austria-Hungary. See CROATIA AND SLAVONIA.

**SLAVONIC ENOCH.** The common designation of one of the Enoch books, extant only in a Slavonic version under the title *The Book of the Secrets of Enoch*. The book contains a description of all the seven heavens, and its ethical teachings approach in many respects those of Christianity. See ENOCH, BOOKS OF.

**SLAVONIC MUSIC.** Just as the hymns of the Church of Rome exerted a powerful influence upon the music of western Europe, so a similar influence was exerted upon the music of eastern Europe through the hymns of the Greek church. Although both the Greek and Roman hymns can be traced to a common origin, a differentiation took place in the earliest centuries of the Christian era and thenceforward the music of the East and the West developed separate characteristics. In the East the folk music became strongly tinged with characteristics of the music of the Greek liturgy, and these characteristics have found their way through the folk music into the art music of the modern Slavonic composers. All the emotions of the Slav peasant find expression either in songs or primitive dance tunes, and every season of the year has its particular songs. The real folk songs of Russia are always metrical, although the poetry does not rhyme. The words are most frequently sung without any instrumental accompaniment. The lively melodies, mostly of gypsy origin, are generally dance tunes in the major keys. They are sung in unison, the rhythm being marked by the feet; whereas the slow melodies—and these are the best and most popular—are in minor keys and are sung in harmony. The national music of the Poles is more fiery and passionate. The melodies, which for the greater part are not remarkable in themselves, are rendered effective by means of skillful ornamentation and piquant rhythms. Difficult and unusual intervals occur with great frequency, imparting to the Polish folk songs something of an instrumental character. The folk music of Bohemia is especially rich in popular dance tunes, some of which, like the polka, have also found great favor in other countries. The influence of Church music is pronounced in many of the folk songs, especially in those dating from the fifteenth and sixteenth centuries, where we find entire chorales introduced as middle sections. The later songs are distinguished by a broad melodic outline, showing to some extent Italian influences, and by a spirit of humor. Consult: A. Soubies, *Précis de l'histoire de la musique russe* (Paris, 1893); A. Pougin, *Essai historique sur la musique en Russie* (ib., 1904); A. Bruneau, *La musique russe* (ib., 1905); R. Batka, *Geschichte*

*der böhmischen Musik* (Berlin, 1906); M. Montagu-Nathan, *A History of Russian Music* (New York, 1914). See FOLK MUSIC; MUSIC, HISTORY OF, XXXIII, XXXIV, XXXVII; OPERA, *Modern Tendencies*, Russia, Bohemia, Poland.

**SLAVOPHILES.** See PANSLAVISM; RUSSIAN LITERATURE.

**SLAVS.** A branch of the Aryan or Indo-Germanic family, constituting the great bulk of the population of Europe east of the meridian of 15° E. as well as of Siberia. Their number in 1910 was estimated at 159,000,000 by Niederle; according to Professor Florinski of Kiev that should be increased by some 25,000,000 for 1915. They are broad-headed (brachycephalic), below the average Aryan in height, with skin pale white, swarthy, or light brown, and eyes brown, gray, and black.

The Slavs comprise the following groups and nationalities: *Eastern Group*—Great Russians, Little Russians or Malo-Russians (Ukrainians and Ruthenians), White Russians; *Western Group*—Poles, Wends, Czechs (Bohemians, Moravians), Slovaks; *Southern Group*—Slovenians, Serbo-Croats, (i.e., Croats, Servians, including those formerly known as Morlaks and Uskoks, Herzegovinians, Bosniaks, Montenegrins), Slavic inhabitants of Macedonia, Bulgarians.

It has long been recognized that in this vast complex resulting from racial mixtures there can be found no "Slav type." Investigations among Slav peoples show an interblending of a great variety of races, and that the Ukrainians (Little Russians) probably deviate least from the primitive types.

The country occupied by Slavs before the great migration of nations appears to have been between the rivers Oder and Dnieper. From this seat in the period from the third or fourth century to the seventh century they spread in all directions, towards the Baltic beyond the Elbe, towards the Danube and the lower Dnieper, and into the Balkan Peninsula. From the tenth century on the Germans pressed back the Slavs, and in the course of centuries many regions occupied by Slavic tribes again became German. The Bulgarian invaders of the Balkan Peninsula were a Turkish people, soon assimilated by the Balkan Slavs. After their settlement in Bulgaria they became Slavified. The Polabians, a Slavic people who dwelt about the lower Elbe and the southwestern corner of the Baltic Sea, have become extinct.

Consult: Lubor Niederle, *La race slave* (trans. by L. Léger, Paris, 1911), containing a full bibliography; also id., *Man in Prehistoric Time* (Russ. ed., St. Petersburg, 1898), and *Slavic Antiquities* (in Czech, Prague, 1902); Florinski, *The Slavic Race* (in Russian, Kiev, 1907). See Colored Plate of WHITE RACES OF EUROPE, under EUROPE, PEOPLES OF.

**SLAVYANSK.** sláv-yánsk'. A town in the Government of Kharkov, Russia, about 100 miles southeast of Kharkov (Map: Russia, E 5). It is noted for its large output and export of salt, obtained from the adjacent lakes. Pop., 1911, 24,274.

**SLEDGE DOG.** A dog used for hauling sledges, especially in the Arctic regions; at first little more than a half-domesticated wolf. The typical Eskimo dog is broad-chested, with powerful shoulders, a short thick neck, sharp wolflike muzzle, slanting eyes, short and generally erect ears. He has a coat of warm and thick hair, normally gray, though black, black and white,

and pure white occur. The "native dogs" endure a surprising amount of cold and work so long as they are fairly fed. Harnessed to a toboggan or a sledge, a team of five will drag a heavy load 60 miles a day, day after day.

There are two other kinds of sledge dogs, the Ostiaks and Samoyeds. The Ostiaks vary much in appearance, some being stout, weighing 50 to 70 pounds, others leggy and wolflike. In color they range from gray to dark brown, are thick-coated, prick-eared, and more or less wolflike in disposition. The Samoyed dogs are entirely white, with the exception of the nose; the tail is bushy and turned over the back, and the ears are pricked. They weigh from 40 to 60 pounds and much resemble large Pomeranians.

**SLEEP, AMINADAB.** A hypocrite in Morris Barnett's comedy *The Serious Family*.

**SLEEP** (AS. *slæp*, Ger. *Schlaf*, sleep, from AS. *slæpan*, Goth. *slēpan*, OHG. *slāfan*, Ger. *schlafen*, to sleep). A condition of the body in which the normal activity of the nervous system is so far reduced that self-consciousness and consciousness of surroundings are entirely wanting or at an extremely low ebb. (On dreamless sleep and consciousness of conditions, see DREAMING; SOMNAMBULISM.) It is, furthermore, a normal and rhythmic process and as such differentiated from stupor, unconsciousness under drugs, and other cases of abnormal loss of consciousness. Its most conspicuous physiological features are relaxation of muscular tone, slower and deeper breathing, slower and weaker pulse, and lessened arterial pressure. As regards the volume of the brain during sleep experiments are not conclusive: it was formerly believed that the cortex, if not the entire cerebrum, is anæmic; but recent experiments seem to show an increase in volume, accompanied by an increase in the height of arterial pulse in the brain. (Shepard.)

There are three main types of sleep theory, the circulatory, the chemical, and the histological. The first circulatory theory was that of congestion. Sleep was the result of pressure upon the brain due to venous congestion. The evidence for this view came from the analogy of sleep to the condition produced by apoplexy, opiates, and the lethargy caused by pressure on the brain in cases of fractured skull. The second theory turns to anæmia, the exact opposite of congestion. A large number of well-attested facts seem to prove the existence of a cortical anæmia during sleep. Pressure upon the carotid arteries will produce a dreamlike state of consciousness. This theory, however, has been challenged by Shepard on the basis of experiments noted above. He has substituted therefor an activity theory, in the belief that certain nervous centres are active during sleep. Psychologically regarded, sleep is a conscious process characterized by attention of high degree and narrow span, the focal elements consisting of "fatigue sensations." Further work is demanded before a decision can be reached.

The chemical theories are of two types, according as they are based on combustion or auto-intoxication. The combustion theories, all of which are concerned with the use of oxygen or carbonic-acid gas, may be represented by Pfüger's idea that the stored-up intramolecular oxygen is exhausted by activity of the nerve cells, which finally become saturated with carbonic acid. The explosions of the cells grow less frequent, and the condition of relative cerebral

inactivity, sleep, thus results. This theory is not buttressed by sufficient experimental evidence, nor does our recent knowledge of the function of oxygen in the body warrant us in attributing sleep to its lack. In the auto-intoxication theories it is asserted that certain products of the decomposition of living substance influence the continuance of cell activity: in the older form of this theory the products mentioned were chiefly lactic acid and creatine; in the recent theories the influence of modern bacteriology has led to the substitution of certain poisons, such as the ptomaines and the leucomaines, which are formed more rapidly than they can be oxidized during active labor of the day. During sleep these poisons are gradually oxidized and removed from the blood. In excessive quantity they produce insomnia, which, as we all know, is often characteristic of extreme fatigue.

The rapid advance in histological technique within the last few years has led to certain discoveries concerning the nature of the nerve cell and its processes, or the neurone, which shed some light upon the conditions of sleep. Of special interest are the results of investigations upon the connection of neurone to neurone. We know that the nerve elements are structurally independent, but functionally interdependent. Microscopic examination has shown that the nerve cell possesses different chemical properties in a waking and in a sleeping or fatigued condition, and that the disposition of the "contact granules" or "gemmules," which some authorities deem the structural means for the interconnection of functioning neurones, varies according to the condition of activity or rest in the nervous system. Upon these facts various theories have been advanced, which find the cause of sleep in dissociations of the neurones. These theories have taken three principal forms: dissociation through amoeboid movements of cell processes, dissociation through interposition of neuroglia (nervous) cells, and profuse connection through torpor of processes.

But no single theory, whether vasomotor, chemical, or histological, is adequate to a complete explanation of sleep. Recent observations of the daily life of protozoa and other simple forms show that such organisms never sleep and, of course, never exhibit phenomena of fatigue. Somewhere in the line of evolution the phenomena of fatigue and sleep must make their appearance. It seems likely, therefore, that profitable work upon the problem of sleep is to be expected in the future from the side of comparative physiology and psychology.

Donaldson, *The Growth of the Brain* (New York, 1897); Marie de Manacéine, *Sleep: Its Physiology, Pathology, Hygiene, and Psychology* (Eng. trans. in "Contemporary Science Series," ib., 1897), containing a bibliography; W. H. Howell, "A Contribution to the Physiology of Sleep," in *Journal of Experimental Medicine*, vol. ii (ib., 1897); *American Textbook of Physiology* (2d ed. by W. H. Howell, 2 vols., Philadelphia, 1901); L. P. Powell, *Art of Natural Sleep* (New York, 1908); J. F. Shepard, *Circulation and Sleep* (ib., 1914); H. A. Bruce, *Sleep and Sleeplessness* (Boston, 1915). See DREAMING; SOMNAMBULISM.

**SLEEPERS, THE SEVEN.** See SEVEN SLEEPERS, THE.

**SLEEPER SHARK, or NURSE SHARK.** One of the large Arctic sharks of the family Scyrnidae, closely allied to the dogfishes (Squalidae), especially *Somniosus microcephalus*, which reaches a length of 25 feet and is an enemy of whales.

**SLEEPING BEAUTY, THE.** The fairy tale of a princess who falls into an enchanted sleep for 100 years and is awakened by a prince who penetrates the dense wood which grew up about her castle. It is told by Charles Perrault in "La Belle au Bois Dormant," in *Contes du temps passé* (1697), translated by Grimm as *Dornröschen* and versified by Tennyson in "The Day Dream." The legend in varying forms is very old, found even in some early Egyptian and Hindu tales, and paralleled in the magic sleep of Brunhilda.

**SLEEPING CARS.** See RAILWAYS.

**SLEEPING SICKNESS, HUMAN TRYPANOSOMIASIS, or NEGRO LETHARGY.** An endemic disease confined to equatorial Africa and characterized in its terminal stages by sleepiness, torpor, and coma. Sleeping sickness was known as far back as about 1800. It was then endemic in a few localities, but of late years it has become widespread, owing to the opening up of the country to trade and travel. The disease is caused by a blood parasite, the *Trypanosoma gambiense*, which is conveyed by two varieties of the tsetse fly, *Glossina palpalis* and *Glossina morsitans*. Wild and domestic animals act as reservoirs for the sickness, the disease in the animal being known as *nagana*, the tsetse fly disease of cattle.

Two types of sleeping sickness are recognized. The Uganda type, carried by *Glossina palpalis* and confined to the watercourses and lake shores, was first identified in 1901. It is violently epidemic and is credited with 200,000 deaths between 1898 and 1906. The variety occurring in Nyassaland and Rhodesia has been known as a distinct form only since 1908. It is highly fatal but not epidemic. The fly that is the conveyer in this case is *Glossina morsitans*, which is irregular in its distribution and is independent of water.

Both whites and negroes are liable to contract sleeping sickness. The parasite is described by Castellani as from 16 to 24 micra. long and from 2 to 5 micra broad. It is undulating, almost wormlike in shape and ends in a flagellum. The parasite at first gains entrance to the peripheral blood and lymph glands, from which it is distributed through all the fluids of the body, being found in the later stages of the disease in the cerebrospinal fluid. The symptoms in the early stage are irregular fever, irritability, headache, sleeplessness, and loss of strength. The eyelids become puffy; an erythematous eruption appears on the skin. After a variable period of apparent improvement the victim becomes more and more lethargic, is aroused with difficulty, takes little food, and becomes emaciated. The anemia is more pronounced, tremors of the hand and tongue are noted, and areas of anæsthesia and hyperæsthesia are seen in some patients. In the final stage the tremors become convulsions, apathy and somnolence merge into torpor and coma. Death takes place in coma or from some intercurrent disease such as pneumonia or dysentery. The duration of sleeping sickness is variable. The first stage may last from a few

months to a few years, and life may be prolonged by careful nursing and medication. In Europeans the duration is given as from one and a half to several years. Consult: Thomas, *Report on Trypanosomes* (London, 1905); Sir Patrick Manson, *Tropical Diseases* (5th ed., 1914); C. W. Daniels, *Tropical Medicine and Hygiene* (New York, 1914).

**SLEEPLESSNESS.** See INSOMNIA.

**SLEEP MOVEMENTS.** See MOVEMENT (in plants).

**SLEEP OF PLANTS.** A popular name for the phenomenon of leaf movement in certain plants, especially of the Oxalideæ and Leguminosæ, whose leaves have a nocturnal position distinct from the diurnal. Usually the petioles rise or fall and sometimes the leaf blades become folded. The phenomenon is due to the sensitivity of certain parts to variations in the intensity of the light reaching them. See MOTOR ORGAN; MOVEMENT.

**SLEEPY HOLLOW.** A picturesque valley near Tarrytown, N. Y., traversed by a small stream called the Pocantico River, famous as the scene of Washington Irving's *Legend of Sleepy Hollow*. It contains an old Dutch church, dating from 1699 and built of bricks brought from Holland.

**SLEEVE DOG.** A Japanese breed of tiny spaniels. See SPANIEL.

**SLEEVE INSIGNIA.** See CHEVRONS; MILITARY INSIGNIA.

**SLEIDAN, slí'dán, or SLEIDANUS, JOHANN (c.1506-56).** An early German historian whose real name was Philippson. He was born at Schleiden, near Cologne, studied law at Liège, Paris, and Orleans, and entering the service of Francis I of France in 1537 acted as intermediary between him and the Schmalkaldic League. In 1544 he made his home at Strassburg and thenceforth was active as diplomat, pamphleteer, and apologist in the cause of the Reformation. In 1551 he represented the city of Strassburg at the Council of Trent. His chief work is *De Statu Religionis et Republicæ Carolo Quinto Cesare Commentarii* (Strassburg, 1553; ed. by Am Ende, Frankfurt, 1785-86), the best contemporary account of the Reformation. He also wrote *Summa Doctrinæ Platonis de Republica et de Legibus* (1548). Consult Baumgarten, *Ueber Sleidans Leben und Briefwechsel* (Strassburg, 1876), and Hasenclever, *Sleidan-Studien* (Bonn, 1905).

**SLEIGHT OF HAND.** See LEGERDEMAIN and MAGIC.

**SLEMMER, ADAM J. (1828-68).** An American soldier, born in Montgomery Co., Pa. He graduated at West Point in 1850, served against the Seminoles in Florida, and then was stationed in garrisons along the Pacific. From 1855 to 1859 he taught at West Point. In January, 1861, he was in command of a body of regular troops in Fort Barrancas, Pensacola Harbor, Fla. On the 10th, after the surrender of the Pensacola navy yard, he transferred his force to the Fort Pickens position in the same harbor. This fort he held against Confederate attack until reinforced. Promoted to be major, he was attached to General Buell's command and took part in the Corinth campaign and the relief of Nashville, became brigadier-general of volunteers (Nov. 29, 1862), and participated in the battle of Stone River (Dec. 31, 1862), receiving a wound that incapacitated him for the rest of the war. In 1865 he was brevetted colonel and brigadier-general in the regular service for meritorious

conduct and was commissioned lieutenant-colonel of the Fourth Infantry. He died while in command of Fort Laramie.

**SLES'WICK.** See **SCHLESWIG**.

**SLEUTH/HOUND'.** See **HOUND**, *Bloodhound*.

**SLEZAK**, sl'zák, LEO (1876- ). An Austrian dramatic tenor, born at Mährisch-Schönberg. He began his musical studies at a very early age and when only 17 made his début as *Lehengrin* in Brünn. In 1898 he sang as guest at the Royal Opera in Berlin with such success that several managers offered him tempting contracts. He accepted the offer of Mahler, and for seven years was a member of the Vienna Opera, whence his fame soon spread over Europe. At the expiration of his time, in 1908, he went to Paris, studying with Jean de Reszke and changing his method completely. His sensational success at Covent Garden in the spring of 1909 led to his engagement at the Metropolitan Opera House in New York, where he immediately became a favorite. With a voice of great beauty and quite unusual power he combined fine histrionic ability and a remarkable stage presence. He came to be regarded as the most impressive *Otello* (in Verdi's opera of that name) since the famous Tamagno, and in addition gained a name as a lieder-singer of the first rank.

**SLICK**, SAM. See **HALIBURTON**, THOMAS CHANDLER.

**SLICK'ENSIDES'.** The name given to the polished surfaces found along the joints and fault planes of rocks. They are caused by the rubbing together of the rocks during faulting or differential movement along the planes of fracture.

**SLIDELL**, JOHN (1793-1871). An American politician, born in New York City. He graduated at Columbia College in 1810. In 1819 he removed to New Orleans and was United States District Attorney for Louisiana (1829-33). In 1853 he became United States Senator but resigned when Louisiana left the Union. In September, 1861, he was appointed commissioner of the Confederate States to France and ran the blockade from Charleston, S. C. At Havana, with James M. Mason, commissioner to England, he embarked on the British mail steamer *Trent*, which was overhauled on November 8 by Capt. Charles Wilkes in the United States sloop *San Jacinto*, and the envoys and their secretaries were arrested and confined for a time in Fort Warren, Boston. At England's demand the act of Wilkes was disavowed and the commissioners sailed for England, Jan. 1, 1862. (See **TRENT AFFAIR**.) Slidell failed in securing the assent of France to the convention giving that nation control of Southern cotton if the blockade should be broken, but was permitted to begin negotiations for the £15,000,000 Confederate loan. At the close of the war Slidell settled in London, where he died.

**SLIDE RULE.** An instrument composed of various scales, the positions of which in relation to each other may be altered, used for the rapid performance of certain arithmetical operations. The scales may be engraved on straight rods, disks, or on the surface of a cylinder. See **CALCULATING MACHINES**.

**SLI'GO.** A maritime county of the Province of Connaught, Ireland, bounded on the north by the Atlantic and the Bay of Donegal (Map: Ireland, C 2). Area, 707 square miles. Pop., 1851, 128,600; 1901, 84,083; 1911, 78,850. The coast

line is indented with numerous bays dangerous for navigation except in the Bay of Sligo. The navigable streams are the Moy, the Owenmore, and the Garroogue. The picturesque loughs Arrow and Gill are in this county. The mineral products consist of copper, lead, iron, and manganese. The chief occupation is cattle rearing. The sea and salmon fisheries are important, and there are manufactures of woollens, linens, and leather. Capital, Sligo. Consult Wood-Martin, *History of Sligo, County and Town* (Dublin, 1890-93).

**SLIGO.** The capital of County Sligo, Ireland, on the Garroogue, 131 miles northwest of Dublin (Map: Ireland, C 2). It is well built, and contains several handsome public edifices. There are a town hall, including an assembly room, exchange, free library, etc., the Roman Catholic Cathedral of Elphin, and the ruins of an old abbey. Steamers ply regularly between Sligo and Glasgow, Liverpool, and Londonderry. Brewing and milling are the chief industries and flour and pork are exported. Sligo had its origin in the erection of a Dominican abbey and a castle in the thirteenth century by Maurice Fitzgerald, Earl of Kildare. In the reign of James I it received a charter. Pop., 1901, 10,862; 1911, 11,163.

**SLIME EEL.** See **HAGFISH**, and **Plate of LAMPREYS AND DOGFISH**.

**SLIMEHEAD.** One of the beautiful, red, richly ornamented berycoid fishes of the genus *Beryx*, called by the French *alfonsines*. They are found in the deep seas of all warm latitudes, and one species (*Beryx splendens*) is taken in the Gulf Stream. See **Plate of MULLET AND ALLIES**.

**SLIME MOLD.** The common name of the *Myxomycetes* (q.v.).

**SLINGELANDT**, sling'e-lánt, PIETER CORNELISZ VAN (1640-91). A Dutch portrait, genre, and still-life painter. He was born at Leyden, where he studied under Gerard Dou, entered the painters' guild in 1661, and became its dean in 1691. Although he never achieved the luminosity and naturalness of his master's best work, he successfully imitated his smooth, careful brushwork. His best works are scenes with children, examples of which are in the Uffizi and Dulwich galleries. Other well-known paintings are the "Meerman Family" (Louvre); "Interrupted Music Lesson" (1672) and "Poultry Vender" (1673), in the Dresden Museum; and "Musical Party in a Kitchen," in the Rijks Museum, Amsterdam.

**SLIP.** A semifluid form of clay with or without other ingredients, used by clay-product manufacturers to coat different wares, such as some kinds of pottery, terra cotta, etc. It is applied for decorative purposes, or also for coating the ware with a more or less impervious skin. See **POTTERY**.

**SLIP METER.** See **STROBOSCOPE**.

**SLIPPED.** In heraldry (q.v.), a term applied to a leaf, branch, or flower which is represented with a stalk and torn from the parent stem.

**SLIVEN**, sl'ven, **SLIVNO**, or **SELIMNIA**. A town in the Kingdom of Bulgaria, situated at the important pass in the Balkan Mountains known as the Iron Gate, 65 miles north of Adrianople (Map: Balkan Peninsula, F 3). Sliven is noted for its black wine and has an important government cloth factory. Pop., 1910, 50,508.

**SLIVINSKI**, slé-vín'ské, JOSEPH (1865- ). A Russian pianist, born at Warsaw. He studied there at the conservatory with Strobl and later took a four years' course with Leschetizky at Vienna, completing his studies with Anton Rubinstein at St. Petersburg. He made his début in 1890, but his reputation was not established until his London appearance three years later. His first American recital took place in 1893. He became well known for his technique, for his mastery of intricate phrasing, and especially for his poetic interpretation.

**SLOANE**, slôn, SIR HANS (1660-1753). A British physician and naturalist. He was born in Ireland of Scottish parents and was educated in London and in France. He was elected a member of the Royal Society in 1685 and of the Royal College of Physicians in 1687. He was physician to Christ's Hospital (1694-1724), president of the College of Physicians (1719-1735), secretary to the Royal Society (1693), in the presidency of which he succeeded Sir Isaac Newton in 1727. He had been created a baronet and physician-general to the army in 1716, and in 1727 received the further honor of being appointed royal physician. He gave a strong impulse to the practice of inoculation by performing that operation on several of the royal family. He formed a museum of natural history, antiquities, coins, etc., and a library of 50,000 volumes and 3560 manuscripts, which he directed to be offered at his death to the nation for £20,000, and which formed the commencement of the British Museum (q.v.). He contributed numerous memoirs to the *Philosophical Transactions*, whose publication he superintended for a number of years, and published in 1745 a treatise on medicine for the eyes.

**SLOANE**, THOMAS O'CONOR (1851- ). An American writer on science, born in New York City. He graduated at St. Francis Xavier College in 1869 and at the School of Mines of Columbia University in 1872. For many years he served as a gas engineer, inventing a self-recording photometer and devising an accurate method for determining sulphur in illuminating gas. In 1888-89 he was professor of natural sciences in Seton Hall College (New Jersey). He wrote the *Electrician's Handy Book* (1905), *Elementary Electrical Calculations* (1909), and many other books on popular science.

**SLOANE**, WILLIAM MILLIGAN (1850- ). An American educator and historian, born at Richmond, Ohio. He graduated at Columbia in 1868, and from then till 1872 was instructor in classics at the Newell School in Pittsburgh. Afterward, while in Germany as private secretary to George Bancroft, then United States Minister at Berlin, he studied history under Mommsen and Droysen. In 1883 he was made professor of history in the College of New Jersey (Princeton), a position which he resigned in 1896 to become professor of history at Columbia. From 1886 to 1889 he edited the *Princeton Review*. A member of the American Academy of Arts and Letters, and in 1911 president of the American Historical Association, Sloane became also Chevalier of the French Legion of Honor and of the Swedish North Star. He published: *Life and Work of James Renwick Wilson Sloane* (1888); *The French War and the Revolution* (1893); *The Life of Napoleon Bonaparte* (4 vols., 1896; rev. and enlarged ed., 1911); *Life of James McCosh* (1896); *The French Revolution and Religious Reform* (1901); *Party Government*

*in the United States of America* (1914); *The Balkans* (1914).

**SLOAT**, slôt, JOHN DRAKE (1780-1867). An American naval officer, born in New York City. He was a midshipman in 1800, but after a year's service was honorably discharged. In 1812, however, he reëntered the navy as a sailing master, and in the war with England was attached to the frigate *United States*, which in 1812 captured the British frigate *Macedonia*. In 1813 he was promoted to be lieutenant, and in 1823-25 commanded the *Grampus*, one of the squadron engaged in suppressing piracy in the West Indies. From 1844 to 1846 he was in command of the Pacific Squadron, and took possession of Monterey and San Francisco early in the Mexican War. He was retired in 1861, but was subsequently promoted to the rank of commodore in 1862 and rear admiral in 1866.

**SLOCUM**, HENRY WARNER (1827-94). An American soldier, born at Delphi, N. Y., and graduated at West Point in 1852. In 1856 he resigned from military service and became a counselor at law in Syracuse, N. Y. In the Civil War he became colonel of the Twenty-seventh New York Volunteers, which he led at the first battle of Bull Run, where he was severely wounded. He returned to active service in September, 1861, as brigadier general of volunteers. He rendered conspicuous service at the battle of Gaines's Mill (q.v.). After Malvern Hill (July 1, 1862) he rose to be major general of volunteers. He was in the second battle of Bull Run and at South Mountain, Antietam, Chancellorsville, and Gettysburg. He later took part in the capture and occupation of Atlanta. In Sherman's march to the sea Slocum was given the left wing, a command which he held until after Johnston's surrender at Durham Station. In 1865 he resigned from the service. He was elected to Congress in 1868 and 1870.

**SLOCUM DISASTER**. One of the greatest marine catastrophes of modern times. The large steamboat, *General Slocum*, carrying about 1800 passengers, was discovered to be on fire while sailing up the East River on June 15, 1904. Before the boat could be grounded a panic seized those on board, and many hundreds leaped overboard to escape the flames, which spread with great rapidity. The vessel was finally beached near North Brother Island, but in spite of the heroic efforts of those who hastened to the rescue, about 1000 persons were drowned or burned to death.

**SLOE**, slô (AS. *slā*, *slāhæ*, OHG. *slēha*, Ger. *Schlehe*, *sloe*), BLACKTHORN or SLOE THORN (*Prunus spinosa*). A shrub of the family Rosaceæ, by some botanists supposed to be the original species of some of the cultivated plums. It is generally a much branched spiny shrub of 4 to 10 feet high, or sometimes a small tree of 15 to 20 feet, with small snow-white flowers, which appear before the leaves. The fruit, generally about the size of large peas, is used for making preserves, brandy, and gin. The juice is much used in the manufacture of spurious port wine and to impart roughness to the genuine.

**SLOKE**, or LAYER. See CARRAGEEN.

**SLONIM**, slō'nyēm. The capital of a district in the Government of Grodno, Russia, situated on the Shara, a navigable tributary of the Niemen, 110 miles southeast of Grodno. It has manufactures of cloth, tobacco, and spirits. Pop., 1911, 21,440, mostly Jews.

**SLONIMSKY**, CHAIM SELIG (1810-1904). A

Russian Jewish physicist, astronomer, and mathematician, born at Byelostok. Slonimsky was a pioneer as a popularizer of science among the Jews. The Hebrew weekly he founded for this purpose in 1862, *Ha-Zefirah*, was the first of its kind. The Russian government made him official censor of Hebrew books (1862-74), a function he performed while acting as dean of the Zhitomir rabbinical seminary. Slonimsky invented a device for transmitting quadruple telegrams (1856), a forerunner of the device perfected by Sir William Thomson (Lord Kelvin) in 1858. Some of his magazine articles were collected and published under the title *Ma'amare Hokmah* in 1891.

**SLOOP** (Dutch *sloop*, Ger. *Schlupe*, sloop; probably from OF. *chaloupe*, from Sp. *chalupa*, Eng. *shallop*). A small vessel having a single mast and fixed bowsprit. A sloop's sails are mainsail, gaff topsail, jib, and staysail; spinaker, club topsail, jib topsail, balloon jib, and flying jib are carried by large racing sloops. Formerly sloops and cutters differed in shape, the cutter usually being much narrower and deeper, but at present the difference in form is very slight. In the days of sailing ships, and of steamers before sails were removed from steam men-of-war, a sloop of war was a ship-rigged vessel, but smaller than a frigate. See YACHT AND YACHTING.

**SLOS'SON**, EDWIN EMERY (1865- ). An American editor and author; also a chemist. He was born at Albany, Kans., and was educated at the University of Kansas (B.S., 1890; M.S., 1892) and at the University of Chicago (Ph.D., 1902). From 1891 to 1903 he was professor of chemistry at the University of Wyoming, and chemist at the Wyoming Agricultural Experiment Station. Thereafter he was connected with the *Independent* as literary or managing editor. From 1912 he was associate on the faculty of the school of journalism, Columbia University. He published: *Great American Universities* (1910), *Major Prophets of To-Day* (1914), and many magazine articles on matters scientific and literary.

**SLOTH** (from AS. *slāw*, OHG. *slēo*, *slēiv*, dialectic Ger. *schlāw*, *schlō*, Eng. *slow*). An edentate mammal of the family Bradypodidae, remarkably adapted to arboreal life, and represented by many species, all residents of tropical America. They vary in size from that of a small bear to that of a cat. They feed on the leaves, buds, and young shoots of trees, among the branches of which they live, rarely descending to the ground. They do not walk upon the branches, but cling beneath them, with back downward, progressing with agility. They are chiefly nocturnal, resting sleepily during the day, from which, and from a misunderstanding of their habits, the misnomer of "sloth" arose.

The forelegs are much longer than the hind ones, and the feet are furnished with long sharp claws, curved into hooks by which sloths hang beneath the branches even in sleep. A peculiarity of the group is the extraordinary number of dorsal vertebrae. The head is round and the muzzle so short that the face is monkey-like. Although members of the order Edentata, sloths are by no means toothless. There are no incisor teeth, but sharp canine teeth, and eight molars in the upper, six in the lower jaw. The molars are cylindrical and are adapted merely for crushing, not for grinding, the food. For

this, however, there is compensation in the stomach—somewhat imperfectly divided, by transverse ligatures, into four compartments, for retention and thorough digestion of the food. The hair is coarse and shaggy, affords excellent protection from insects, and gives sloths such a

JAWS AND TEETH OF SLOTHS.

1, three-toed sloth (*Bradypus tridactylus*); 2, collared sloth (*Bradypus infuscatus*).

gray appearance that they are not readily observed except when in motion.

The sloth produces only one young one at a birth, which clings to its mother till it becomes able to provide for itself. The voice of the animal is a low plaintive cry. Less than a dozen species of sloth are known, grouped in two sub-families, according to the number of toes on the forefeet. All have three toes on the hind feet, but the Cholepodinae have only two toes on the front feet, the Bradypodinae three. The latter have nine cervical vertebrae and 20 abdominal, and of the latter 15-17 bear ribs; while the former have only six or seven cervical vertebrae, and 27 abdominal, of which 23-24 bear ribs. Of the Cholepodinae, or "unauas," there are only two species, the two-toed (*Cholepus didactylus*), common in Brazil, and a Central American spe-

JAWS AND TEETH OF TWO-TOED SLOTH.

cies (*Cholepus hoffmanni*), which is lighter colored. They are about 2 feet long. Of the Bradypodinae conspicuous species are the three-toed sloth (*Bradypus tridactylus*) and the collared sloth (*Bradypus infuscatus*). The latter is the largest of the family and has a collar of long black hair around the neck, behind which is a patch of pale orange. Consult: Alston, "Mammals," in *Biologia Centrali-Americana* (London, 1879-82); Richard Lydekker, *Royal Natural History*, vol. iii (ib., 1895); F. E. Beddard, "Mammalia," in *Cambridge Natural History*, vol. x (New York, 1902), and the memoirs there cited relating to anatomy and classification; H. W. Bates, *Naturalist on the River Amazons* (new ed., London, 1910). For fossil forms of the sloth, see GANODONTA; MAMMALIA, FOSSIL; MEGATHERIUM; MYLodon.

**SLOTH BEAR.** See BEAR, and Plate of BEARS.

**SLOUGH**, slou. A market town and railway junction in Buckinghamshire, England, 18 miles

west of London and 2 miles north of Windsor Castle (Map: London, D 1). Here the elder Herschel erected his observatory and great telescope and made many of his important astronomical discoveries. Pop., 1901, 11,461; 1911, 14,982.

**SLOUGH.** See NECROSIS.

**SLOUGH OF DESPOND.** A bog encountered by Christian, in *Pilgrim's Progress*. It typifies the discouragement caused by a sense of sin.

**SLOVAKS,** *slôvâks*. A Slavic people of northwestern Hungary and southern Moravia, closely akin to the Czechs. According to Niederle they number more than 2,500,000, not counting those in the United States. Most of them are Roman Catholics. Consult: J. Capek, *The Slovaks* (New York, 1906); R. Seton-Watson, *Racial Problems in Hungary: A History of the Slovaks* (London, 1909); L. Niederle, *La race slave* (Fr. trans., Paris, 1911).

**SLOVENE LANGUAGE.** See SLAVIC LANGUAGES.

**SLOVENIANS,** *slô-věni-ânz*. A South Slavic people of Austria-Hungary, inhabiting Carniola (where they constitute the great bulk of the population), the southern part of Carinthia and Styria, the environs of Udine in Friuli, Gorizia (Gorica, Görz), and other districts. About the sixth century they migrated from their home in the Carpathians to the south of the Danube, where they remain. The Slovenians number over 1,500,000 people, including some 100,000 who have settled in the United States. (Niederle.) Consult L. Niederle, *La race slave* (Fr. trans., Paris, 1911). See SLAVS.

**SLOWACKI,** *slô-vâts'kê*, JULIUSZ (1809-49). A famous Polish Romantic poet. He was born at Kremenez in Volhynia, and was educated at the University of Vilna. In 1831 he left his country, never to return. Among his works are the poems "Jan Bielecki," "Arab," "Lambro," "Anhel," "Beniowski," an epic in five cantos from the time of the Bar Confederacy, containing satirical allusions to his contemporaries, "Waclaw," "King Spirit," the dramatic poem "Kordjan," and the dramas *Maria Stuart*, *Mazepa*, *Balladyna*, and *Lilla Weneda*. Some of these were translated into several languages. His collected works were published at Leipzig (4 vols., 1860) and at Lemberg (4 vols., 1880); his posthumous works were issued in 1866 and 1885. Consult the biographies by Malecki (Lemberg, 1881) and Hoenek (Warsaw, 1897); also Sarrazin, *Les grands poètes romantiques*; Mickiewicz, *Slowacki*, *Krasinski* (Paris, 1906).

**SLOW LEMUR.** A lemur of the genus *Nycticebus* or *Loris*, noted for its slow movements, especially the common Asiatic loris, also called sloth monkey (*Nycticebus tardigradus*). See LORIS, and Plate of LEMURS.

**SLOW MATCH.** A rope or cord which has been saturated or steeped in a solution of saltpetre, so that it will burn slowly and regularly. Fuses or electric sparks now replace this in ignition of gunpowder or explosives. (See BLASTING.) For igniting fireworks quick match, which burns more rapidly, is used. See PYROTECHNY.

**SLOWWORM** (AS. *slâwyrn*, *slâwerm*, slow-worm, from *slân*, Goth., OHG. *slahan*, Ger. *schlagen*, to strike + *wyrn*, *werm*, worm; influenced by popular etymology with Eng. *slow*). A burrowing elongated lizard of the family Anguillidae. One of the slowworm species (*Ophiomorus ventralis*) occurs in the United States

south of the Ohio River and is sometimes called joint snake because, on account of a loose articulation of the vertebrae, the tail easily separates from the body. See BLINDWORM, 1.

**SLUBBER.** See SPINNING.

**SLUDGE.** See CORTONSEED.

**SLUG** (from ME. *sluggen*, Norw., Swed. *slôka*, to go draggingly, to droop, Icel. *slôkr*, slouching fellow). A terrestrial pulmonate gastropod or snail, in which the shell is represented by an internal horny plate overlying the respiratory cavity. The slugs are chiefly of two families, Limacidae and Arionidae, and most commonly are of the genus *Limax*. They are vegetable eaters and often ascend trees in search of food and then let themselves down by means of a mucous thread spun from a gland opening on the anterior edge of the foot. In Europe they ravage garden and field crops, but do little damage in the United States. Their general economy is that of the snails (q.v.). The great gray slug, sometimes 4 inches long, is a European species, introduced into and now become common in eastern North America. A native American slug, which is very common in the United States, is *Limax campestris*, a small species of slug less than 1 inch long.

**SLUTER,** *slû'tër*, CLAUX (?-c.1405). The principal Dutch sculptor of the later Middle Ages. The earliest record of his life is that in 1389 he became statuary in ordinary at Dijon to Philip the Bold of Burgundy, whose service he had entered a few years before. In charge of the sculptures for the Carthusian monastery, the Chartreuse de Champmol, which Duke Philip had founded in 1383, he surpassed in ability all his predecessors. His works are noble and original in conception and characterized by a powerful, trenchant, and yet pictorial realism. In 1398 Sluter, aged and infirm, called to his aid his nephew and pupil, Claux de Werne, of Hattem, to whom must be attributed a more or less important part in the execution of his uncle's latest productions. The earliest of Sluter's works that still remain on the site of the former Chartreuse, now occupied by a lunatic asylum, are the figures on the portal of the chapel (c.1390-94), to wit, "Duke Philip in Prayer," "Saint John," "Duchess Marguerite," and "St. Catherine," the first and last remarkable for the freshness of their realism. Next comes the famous "Moses Fountain" (1395-1404) in the courtyard, a hexagonal base with the life-size figures of the "Six Prophets," admirable specimens of psychological individualization, polychrome, according to mediæval usage. A reproduction of this is in the Dijon Museum which also contains Sluter's masterpiece, the "Tomb of Philip the Bold" (1404-11), in black and white marble, the mighty sarcophagus surrounded with arcading, through which passes a procession of 40 small alabaster figures of mourners, exquisite in finish. The recumbent figure of the Duke is of striking realism. Claux de Werne undoubtedly completed this monument. Consult Alfred Gonsse, *L'Art gothique* (Paris, 1890), and id., *La sculpture française depuis le XIV<sup>me</sup> siècle* (ib., 1894).

**SLUTSK,** *slûtsk*. The capital of a district in the Government of Minsk, Russia, situated 123 miles south of Minsk. Pop., 1910, 16,190. Slutsk passed to Lithuania in the thirteenth century and attained great importance as the capital of the Principality of Slutsk. It came into the possession of Russia in 1795.

**SLY, CHRISTOPHER.** A tinker and bear keeper who, in the induction to Shakespeare's *Taming of the Shrew*, is found drunk, taken to a lord's house and made to believe he is master, while the comedy is performed before him.

**SMALCALD, smäl'kald.** A town of Prussia. See SCHMALKALDEN.

**SMALCALDIC** (smäl-käl'dik) **LEAGUE.** See SCHMALKALDIC LEAGUE.

**SMALL, JOHN KUNKEL** (1869- ). An American botanist. He was born at Harrisburg, Pa., and graduated from Franklin and Marshall College in 1892 and from Columbia (Ph.D.) in 1895. After serving as curator of the Columbia herbarium in 1895-99 he was curator from 1899 to 1906 and head curator after 1907 of the New York Botanical Garden. His papers deal largely with the flora of North America and of Patagonia. He published: *Shrubs of Florida* (1913); *Florida Trees* (1913); *Flora of Miami* (1913); *Flora of Lancaster County* (1913); *Flora of the Florida Keys* (1913); *Flora of the Southeastern United States* (2d ed., 1913).

**SMALL ARMS.** A military term denoting the firearms carried by the soldier, in contradistinction to machine guns and artillery. Under this title will be found discussed the history of the development of the modern military rifle, while pistols and revolvers are discussed under their own heads. Firearms used for purposes of sport are treated under RIFLE, HUNTING; SHOTGUN.

Hand firearms date from about the fourteenth century and were at first like the hand cannon

pivot which, passing through the stock, formed a lever for the hand. Before the weapon could be discharged it was necessary to bring the serpentine in contact with the burning match on the barrel, until the former was ignited, after which the lever was raised and the serpentine brought to the priming of the touchhole and the gun discharged. The next improvement was to reverse the position of the serpentine and provide a spring to hold the match away from the touchhole, after which a pressure brought to bear upon the lever caused the serpentine with lighted match to fall into the flash pan.

Many strange varieties of firearms came into use—combinations of club and pistol, of pistol and battle ax, and particularly the "holy-water sprinkler," a strong mace formed by four or more barrels arranged as is the chamber of the modern revolver. An improved invention in the form of the wheel lock was made in 1515. It consisted of a grooved steel wheel, having a serrated edge connected to the lock plate by means of a chain and spring. The spring power was obtained by winding the wheel so that when the

BREECH MECHANISM OF UNITED STATES SPRINGFIELD RIFLE, CALIBRE 0.45 INCH.

or bombardello—a small bombard, fired from the shoulder by means of a match applied to a touchhole. The bombard was welded on to an iron rod, which was carried suspended from the neck of the soldier. The powder chamber was smaller in its internal diameter than the bore of the gun, but externally larger. These weapons are also known as *bâtons-à-feu* (fire sticks). The hand culverin was a small cannon secured to a stock by iron bands and had a bore of little more than half an inch, but was in general use throughout Europe. The Swiss army at the battle of Morat (1476) included about 6000 culveriniers. The hand culverin was fired from a forked rest usually and required two men to work it—one aimed and held the weapon; the other discharged, loaded, and assisted in carrying it. Improvements included an enlarged bore, a bent stock, and finally the side touchhole. The barrels were octagonal or hexagonal. Small culverins were used for horseback fighting and larger ones for foot soldiers. The first real approach to the modern small arm was the early matchlock, the ordinary gun of the period with the addition of a serpentine or cock for holding the match. The serpentine was hung upon a

gun was charged the wheel would be wound up, the cover of the flashpan withdrawn, and the pyrite which was held in the cock permitted to come in contact with the wheel. When the trigger was pressed the check on the wheel was released, and sparks produced by the friction of the wheel against the pyrite and the priming ignited the charge. Owing to its expense, the wheel-lock gun was used almost entirely for sporting purposes, and soon after this the use of firearms in the chase became general.

The flintlock, which followed the wheel lock, seems to have been of Spanish origin and to date from early in the seventeenth century; in it the process of igniting the charge was considerably simplified. The hammer or cover plate was forced backward by the bolt so that the flint, which was screwed in the jaw of the cock, and the priming in the flashpan were exposed to the sparks caused by the contact of the flint and the hammer, and thus the charge was ignited. The flintlock was a long time coming into favor, owing to the fact that in its original form the sparks frequently escaped without firing the charge. Flintlock muskets were first introduced into England during the reign of William III

and in one form or another remained in use in the British army up to as late as 1840.

In the improved methods of ignition which Forsyth made possible the next important step in the evolution of small arms was accomplished. His invention dates from 1807 and is described as "a detonating principle for exploding gun-powder in firearms, etc." Many subsequent improvements in the system were made by the manufacturers whom the patentee engaged to make the guns. The percussion principle was applied first to muzzle-loading and afterward to breechloading guns, but did not at first appeal to the various governments of Europe as suitable for weapons for military purposes.

**Modern Military Rifles.** Although the principle of rifling small arms dates from the beginning of the sixteenth century, it was not till towards the close of the seventeenth that the principle was employed for military weapons. Owing to the fact that the rifle could not be loaded after a few rounds had been fired, some method had to be found to obviate this; nothing

gun, the forerunner of all bolt-action guns. In 1841 the Prussians adopted their famous needle gun, which brought many victories from 1848 to 1866.

This weapon marked a great advance in military rifles. The bullet was conical in shape and together with the powder was inclosed in strong paper. In the centre of the outer surface of the wad (immediately behind which was the powder) was a detonator, to explode which the needle fixed in the breech would upon pulling the trigger be released and penetrate the cartridge. The French adopted the Chassepôt (q.v.), an improved needle gun. This gun, as well as other weapons employed by European armies, had the action now generally used, a bolt containing firing pin and spiral spring and sliding axially with the bore in a metal receiver behind, and fastened to, the barrel. A handle fastened to one side of the bolt engages in front of a lug when the bolt is run forward and rotated to the right, thus locking the breech.

England converted her Enfield rifles, of the

UNITED STATES MAGAZINE (KRAG-JÖRGENSEN) RIFLE, CALIBRE 0.30 INCH.

proving satisfactory until an English gunmaker in 1836 devised an egg-shaped bullet with a cavity at one end to receive a conical plug which under pressure of the gas generated by the discharge expanded the bullet into the grooves. The Minié rifle of the French was the next improvement on this; in that an iron cup was utilized to expand the cone when forced home by the gas. In the three-grooved Enfield rifle (English) of 1855 a wooden plug was used instead of the iron cup. Next followed the Whitworth hexagonal rifling, which made possible the use of an elongated bullet and which lowered the trajectory of the bullet by offering a smaller front to air resistance.

The first breechloading small arm of consequence was Hall's rifle, invented in 1811 and manufactured in small quantities about 1818 for the United States army; its chamber rose on a hinge at the rear end for loading. About 1812 Pauly, an officer under Napoleon, evolved a breechloader which is the progenitor of all later guns with swinging block. Dreyse, working under him, developed a discarded model of Pauly's into a successful breechloading needle

three-grooved expanding-bullet muzzle-loader type, into Snider breechloaders by alterations at the breech end of the barrel. A chamber was made by which the cartridge could be inserted in the barrel, after which the block (worked on a hinge) was closed and the space filled. A needle or striker passed through the breech block, struck the cap in the base of the cartridge, and thus ignited the charge. In 1869 the Martini-Henry rifle was adopted for the British army. It consisted of a combination of the Martini breech action with the Henry barrel. The Italians and Swiss adopted the Vetterli gun, which was of the repeater or magazine type, having a tube under the barrel in which were contained 11 cartridges, which were in turn forced into the breech by the same action which discharged the empty cartridge. Russia adopted the Gorloff gun with a block hinged in front and rising to open. This is the principle of the Springfield breechloading rifle (calibre 0.45) adopted for the United States army in 1873, and retained until 1892 (see illustration), when it was succeeded by the United States magazine rifle, developed from the Krag-Jørgensen.

The question of magazine arms was considered (1891-92) in the United States by a board which tested 53 different designs, among which they

UNITED STATES MAGAZINE RIFLE AND CARBINE, CALIBRE 0.30 INCH.

Transverse section through magazine.

found two general classes—repeaters, which could not be used as singleloaders while the magazine was charged, and magazine guns proper, in which the magazine could be charged and held in reserve for an emergency while loading is done shot by shot. The gun selected was

UNITED STATES MAGAZINE RIFLE AND CARBINE, CALIBRE 0.30 INCH.

The same cross section when all but the last cartridge has been fired; the magazine is "on" and the bolt opened.

one of the latter class—a bolt-action gun with magazine under and rising to the left of the chamber. It had a clasp containing five cartridges placed under and to the left of the receiver; the calibre of the barrel was 0.30 inch. It was sighted up to 1900 yards and had a firing

for it. The Krag-Jørgensen bullet had a weight of 220 grains and a velocity of 2200 feet per second. It had an inside of tin and lead composition and an outer jacket of cupronickel steel. Its weight without bayonet was 9.187 pounds, and its total length without bayonet 48.9 inches. The cartridges are put in on the right through a gate, lie side by side, and are pushed sideways across and up into the chamber by a follower. Partly entering the magazine, they are caught by the bolt coming forward, forced on an inclined path into the bore, and supported behind by the bolt, which is locked by lugs and the handle engaging in recesses when rotated.

An example of the repeater is the Austrian Mannlicher, a bolt gun, into which is introduced from above, through the receiver, a metal packet holding five cartridges. The packet forms an essential part of the mechanism until all its cartridges have been used, when it falls out. There is no cut-off, as in the Krag-Jørgensen, by which the magazine can be held in reserve; all five cartridges must be fired before any more can be put in.

The Mauser rifle was a modification of the French Chassepôt, constructed for the use of the military gas-check cartridge. It was first adopted by the Prussian government as the successor of the needle gun, but it has been so frequently improved that even in 1916 it still remained one of the most effective of modern military weapons. The Spanish troops were armed with the Mauser magazine rifle during the Spanish-American War and derived from it a great advantage in effective rifle fire over the American volunteer regiments, who were for the most part armed with the Springfield 0.45. The bore of the original Mauser as adopted for the Prussian military service was 11 millimeters (0.433 inch) diameter and was rifled with four flat grooves. The length of the barrel was 33.65 inches, and the total length 53.15 inches.

During the last half of the nineteenth century the muzzle-loader was superseded by a single-shot breechloader, and this in turn by a magazine rifle, this latter now replaced in some armies by automatic rifles ejecting and loading by the energy of discharge. During this time there was a constant decrease in the calibre until 1895, when some reaction was felt. The average

UNITED STATES SPRINGFIELD MAGAZINE RIFLE, MODEL 1902. LONGITUDINAL SECTION.

capacity (single-loading) of 42 shots to the minute. It was the weapon used by the United States regular troops in the war with Spain (1898) and was found to be all that was claimed

is now about 0.30 inch, that of the United States gun. The wisdom of arming the soldier with an automatic magazine rifle is a subject of debate among military authorities. It is argued on the

one hand that the percentage of hits with repeating fire weapons indicates wasteful and badly directed fire, and such an arm is subversive to good fire discipline, besides adding to the already complex problem of ammunition supply. On behalf of the automatic and magazine systems it is urged that the soldier is in a constant state of readiness, and that, notwithstanding a tendency to wastefulness, its faults are more than compensated for in critical moments when rapid-fire action is of importance. In 1903 the tendency was to reduce the length of the barrel and increase the strength of the charge, to increase the magazine capacity, and, where such was not already employed, to replace the detachable magazine with a clip, and from that time to the outbreak of the Great War there was but little change.

The Springfield magazine rifle, model 1902, was next adopted as the military weapon of the United States. It differs from the weapon that is displaced in that it is centrally fed by clips and the bolt has two lugs instead of one. The barrel has four grooves and a calibre of 0.30. The bullet weighs 220 grains and is fired by a powder charge of a little over 44.5 grains, giving a pressure of 4200 pounds per square inch and an initial velocity of 2300 feet, a velocity at 1000 yards of 958 feet, and a muzzle energy of 2581.6 foot pounds. The rifling in the barrel makes one turn in 8 inches. The magazine is charged from a clip, the cartridges being forced from it directly into the magazine by pressure of the thumb on the top of the cartridge. The clip is ejected by the forward motion of the bolt. The gun may be used as a single loader with the magazine empty, and it may be filled by the insertion

preciable reduction in weight. In the old weapon there was a small wooden grip to protect the hand from the heat of the barrel; in the new one the barrel is inclosed in a wooden casing throughout its entire length, to within an inch of the muzzle. This, of course, necessitated a new method of fixing and securing the bayonet. A separate nose cap is fitted to the barrel, to which the bayonet is attached. A greater velocity of the projectile is secured by slightly enlarging the bore from about 10 inches from the muzzle, on the principle that where the bore begins to increase the force of the explosion of the cartridge has already been expended, so that by enlarging the bore a small fraction of an inch an increased velocity is obtained, because if the bore were of the same diameter throughout its entire length the tight barrel would cause friction and a consequent reduction of velocity. The disadvantage of the shortened barrel is that the back and fore sights are brought closer together, thus demanding greater care in taking aim, since the possible angle of error is greatly increased. To obviate this the backsight has been made so as to be capable of adjustment up to a considerable range without raising the leaf. The magazine is concealed within the stock and carries 10 cartridges, as did the former rifle, but instead of loading the magazine by hand a clip similar to that of the Mauser rifle is employed.

The Mannlicher automatic rifle is an improvement on the ordinary Mannlicher model, is 0.7 kilogram (1.54 pounds) less in weight, and has a shorter barrel than the original weapon. It is an automatic firearm with a fixed barrel, the bolt mechanism being operated by powder gases from the barrel, which act on a piston moving in a gas cylinder parallel to the barrel and the bolt. The energy created by the gases is transmitted from the piston to the breech mechanism. The gas piston is driven back a short stroke by the gas, upon which it unlocks the bolt and starts it towards the rear. The gas piston does not accompany it the entire length of its movements in either direction, its function being confined to impelling it rearward. The advantage of this is that it enables the breech mechanism to be operated with a short and light brass cylinder and piston, at the same time leaving the greater part of the movement to the barrel, independent of the gas mechanism, so that should the opening in the barrel for the escaping gas be closed the breech mechanism can still be operated independent of the gas mechanism, as in the ordinary repeating rifle. The vent is bored in the barrel through which the powder gases enter the gas cylinder the moment the projectile has passed beyond the vent, the gas cylinder being fastened underneath the valve by means of a screw. The piston, situated in the gas cylinder, is constantly pressed forward by a spiral spring and is forged in one piece with an arm extending to the rear and side. This arm moves in a slit in the sleeve and engages with the bolt by means of a lug. The mechanical process by which the rifle is operated is that of all automatic firearms; the bolt continues its rearward movement under the impulse received (as described), the hammer is cocked, and the empty shell is disengaged from the extractor by a blow against the ejector, after which the bolt spring drives the bolt forward again. Several important advantages are claimed for this weapon, one being that the vent in the barrel leading to the gas cylinder

of a single cartridge. There is a knife bayonet, which is about 16 inches long and weighs one pound. In connection with the preliminary tests of this weapon before the examining board it was noted that it exceeded by 9.3 per cent in rapidity and 18.6 per cent in hits the results obtained by the same marksman with the regular service weapon. Later tests gave more favorable results.

The weapon with which the British army was equipped in 1903 was a modification of the Lee-~~Metford~~ Metford weapon. Notwithstanding all that had been promised for the Lee-~~Metford~~ Metford magazine rifle, with which the troops were armed during the South African War, it was found to be deficient in all the qualities that make a good service weapon. The new weapon was 5 inches shorter than the old one, thus securing ap-

can be sealed by the screw, making the weapon to all intents and purposes a nonautomatic repeating rifle. Again, should it be operated automatically and the bolt spring become useless or break, the breech mechanism may be locked by hand and the rifle still remain available as a repeater.

The construction of the Mauser automatic repeating rifle is closely similar to the automatic pistol of that name in that the energy required for its operation is supplied through the recoil. (See PISTOL.) After firing the barrel is moved backward by the breech. The same movement readjusts the spring and cocks the hammer, after which the barrel is disconnected from the breech action. The breech, however, continues its recoil movement by virtue of the velocity acquired, and besides extracting from the barrel and ejecting the shell from the breech causes the compression of a second recuperating spring. The first spring then expands and reloads the chamber; the breech is closed, and the second spring expanding in its turn brings the barrel into a firing position. Thus, all that is necessary is to press the trigger and the weapon continues to fire to the full extent of the magazine capacity.

The carbine employed by all the nations of the world is the cavalry firearm, which uses the same cartridge as the infantry rifle and with most nations is constructed on the same principle as the rifle.

A change which affected all rifles previously constructed occurred at the beginning of this century. A much desired requirement of a rifle is that the trajectory of the bullet should be so flat as to make the space vertically under it so small that it would pass through a man or horse for the greater part of its range. The importance of this is apparent, since any object between the target aimed at and the rifle would be in the path of the projectile unless the trajectory is so curved that the projectile would pass over it. To obtain a flat trajectory it is evidently necessary to increase the power of the rifle—in other words, give a greater velocity to the bullet. This, however, for the same weight gives a greater kick of the rifle, which would quickly tire the man firing and interfere with the accuracy of his aim. The change that greatly improved this condition was first adopted by Germany and consisted in the use of a pointed bullet instead of the more blunt form previously used. With this pointed bullet the air resistance was reduced to such an extent that for the same range the weight of the bullet could be reduced while its velocity was increased, without increasing the kick of the rifle. This resulted in greatly increasing the effective range for the same elevation of the rifle, or in permitting a less elevation for the same range, which of course greatly increased the dangerous space.

This change required rechambering of all rifles and was naturally not adopted by most countries until they were practically forced to do it by rival countries. France quickly followed the lead of Germany, while England delayed with the result that at the beginning of the Great War she was equipped with an inferior rifle to that of her enemy. The United States adopted the pointed bullet in 1906. The modified rifle, which is the one adopted for both cavalry and infantry, is designated "United States Rifle Model of 1903." Its action is the same as that described for the 1902 Springfield. This rifle is generally conceded to be the best military

rifle in the world. It possesses wonderful accuracy and is simple and reliable. The following data pertain to the rifle and ammunition: 23 aimed shots have been fired in one minute with this rifle, used as a single-loader, and 25 shots in the same time, using magazine fire. Firing from the hip without aim, 30 shots have been fired in one minute, using the rifle as a single-loader, and 40 shots in one minute, using magazine fire.

MAXIMUM RANGE	Elevation	Time of flight
4891.6 yards	45 degrees	38.058 seconds

The powder pressure in the chamber of this rifle is about 51,000 pounds per square inch.

#### DANGEROUS SPACES

(The dangerous spaces were calculated under the assumption that the gun, when fired, is 12 inches above the ground, that the height of a man is 68 inches above the ground, and that the gun is aimed at the middle point of the target.)

#### RIFLE AGAINST INFANTRY

DISTANCE TO TARGET (yards)	Rising branch of trajectory	Falling branch of trajectory In front of target
	<i>Yards</i>	<i>Yards</i>
100.....	All	All
200.....	All	All
300.....	All	All
400.....	All	All
500.....	All	All
600.....	All	All
700.....	232.7	113.2
800.....	174.5	73.4
900.....	138.2	52.6
1000.....	112.4	39.7
1100.....	93.1	32.4
1200.....	78.3	25.5
1300.....	66.7	21.2
1400.....	57.4	18.0
1500.....	49.8	15.3
1600.....	43.7	13.3
1700.....	38.5	11.5
1800.....	34.2	10.4

2500.....	16.9	5.2
2600.....	15.5	4.7
2700.....	14.2	4.3
2800.....	13.0	3.9

Initial velocity..... 2700 feet per second.  
Powder pressure in chamber about 51,000 pounds per sq. in.  
Weight of ball cartridge..... about 395.5 grains.  
Weight of bullet..... 150 grains.  
Weight of powder charge..... about 50 grains.

The data shown in the table on page 183 pertains to rifles as used in various countries at the beginning of the Great War.

Consult: Great Britain War Office, *Text Book of Small Arms* (London, 1909); O. M. Lissak, *Ordnance and Gunnery* (New York, 1914); Ommundsen and Robinson, *Rifles and Ammunition and Rifle Shooting* (ib., 1915). See SMOKELESS POWDER.

**SMALLEY**, sma'lē, GEORGE WASHBURN (1833-1916). An American journalist and author, born at Franklin, Mass. He graduated at Yale (1853), studied law at Harvard, and practiced in Boston. From 1861, when he went to the front in the Civil War as correspondent, he was for many years connected with the *New York Tribune*. He was on the editorial staff of

this paper (1862-67) and, after organizing its European bureau in London (1867), was in charge of its European correspondence during the Franco-Prussian War and until 1895. From that year till 1906 he was again in America as correspondent of the *London Times*. He published *London Letters and Some Others* (1891); *Studies of Men* (1895); *Anglo-American Memories* (1911; 2d series, 1912).

**SMALLPOX**, or **VARIOLA**. An acute, infectious, febrile disease, characterized by an eruption showing papular, vesicular, and pustular stages, followed by crusting. The first accurate description of variola was given by Rhazes, an Arabian physician of the ninth century. After the Crusades it prevailed in many southern countries of Europe and spread into England and the more northern countries by the thirteenth century. The Spaniards brought it to America early in the sixteenth century. It appeared first in Santo Domingo, three years later in Mexico, when it destroyed 3,000,000 people, and thence spread with frightful severity over the New World. In 1707 it reached Iceland, when more than a quarter of the inhabitants fell victims, and in 1733 it almost depopulated Greenland. In the seventeenth century a study was made of the disease by Sydenham, who devised a better treatment, but no means of preventing its spread were known until Jenner discovered vaccination (q.v.) in 1796. An attempt to mitigate the severity of smallpox was made by reviving the practice of inoculation (q.v.), and this was introduced into England by Lady Mary Wortley Montagu in 1718.

Smallpox is one of the most contagious of diseases, and few who are exposed, unless protected by vaccination, escape infection. Even the unborn child may be attacked through the medium of the mother and may be born with the characteristic rash or pitted. The malady is particularly fatal in young children and among aboriginal races; negroes are especially susceptible. One attack usually, but not invariably, protects against another. No specific microorganism has been identified with the disease, although eagerly sought. It is probably an intracellular protozoön, appearing in the epithelial cells of the lesions. Guvier first described these bodies clearly in 1892, giving them the name *Cytorytes vaccinae*. Guvier's findings have been confirmed by others, notably by Councilman and his followers. The *contagium* exists in the pustules, in the fluids of the body, and apparently in the exhalations from the lungs and skin. The dried crusts thrown off during desquamation are the most important element in disseminating the malady, which travels long distances and with great rapidity, through the medium of clothes, furniture, or other articles in contact with a patient.

The first symptoms make their appearance after an incubation period of about 12 days. The onset is abrupt, with a severe chill, pains in the back and limbs, intense headache, and vomiting. The temperature rises rapidly to 103° F. or 104° F. On the third day the typical rash appears. This may be preceded by a preliminary eruption assuming various characters in different cases. These initial rashes commonly appear on the second day, if at all, and fade away before full development of the typical eruption. The latter begins as a collection of small red papules on the face, spreading rapidly downward over the whole body. It also

occurs upon the mucous membranes. On the third day after their appearance they develop into vesicles filled at first with a clear transparent fluid, which becomes purulent in the three days following, this change being preceded by a process known as umbilication. Each vesicle becomes depressed in the centre, the circumference forming a prominent ring. This change often causes great swelling of the face. The suppurative stage lasts two or three days, after which the pustules gradually dry, leaving in their place depressed white scars, popularly known as pits. After the initial rise of temperature, coincident with the primary rash, the temperature falls nearly or quite to the normal, remaining low until the vesicles begin to mature, when the secondary or suppurative fever begins. This lasts for six or eight days and is accompanied by sleeplessness, headache, perhaps delirium. The fever subsides with the drying up of the eruption, and convalescence begins.

Several varieties of smallpox are described. To the ordinary or discrete the description given above applies. In this the pustules remain distinct and scattered. Confluent smallpox is a severe form in which the rash is very abundant and the pustules exhibit a tendency to coalesce and form blebs. The mortality in this variety is very high. Malignant or hemorrhagic variola is characterized by small hemorrhages beneath the skin and is often fatal. Modified smallpox, often called varioloid, occurs in persons who have been vaccinated, but whose protection is incomplete on account of the lapse of time or because vaccination was inefficient. This variety is of short duration, and recovery is the rule. In the form of smallpox produced by artificial inoculation a pimple arises at the seat of the operation on the second day. This develops into a vesicle or pustule and is followed by modified symptoms of the disease. About the eleventh day the typical eruption of variola appears and passes through its various stages. The attack is generally mild and confers immunity, but it is, on the other hand, sometimes fatal and always contagious. Inoculation is no longer practiced. Variola may be complicated or followed by destruction of the eyes, chronic discharge from the ears, bronchitis, pneumonia, and pleurisy.

The preventive treatment of smallpox at the present time consists almost solely in vaccination and isolation. That vaccination confers complete immunity not only to individuals but to communities has been abundantly proved. A patient with the disease should be placed in bed in a well-ventilated room and should have an abundance of milk and other easily digested liquid foods, with cooling drinks for thirst. Fever is kept within the limits of safety by cold sponging. Many attempts have been made to prevent the occurrence of disfiguring scars or pits. Painting the face with iodine or silver nitrate, washing it with various antiseptic lotions, anointing it with carbolized oil, have all been tried with indifferent success. The best plan is to protect the face from the light and keep it covered with a mask of lint saturated with antiseptic solution. Light rays passed through red glass are reported to prevent pitting, in harmony with the old belief that red curtains and hangings had this effect. But if the inflammatory process goes below the true skin a pit will result. The eyes should be sponged frequently and kept free from secretion. Beyond these measures the treatment is

purely symptomatic, no specific having been discovered for the disease. Consult: J. J. Clarke, *Protozoa and Disease*, part ii (New York, 1908); T. F. Ricketts, *Diagnosis of Smallpox* (ib., 1910); William Hanna, *Studies in Smallpox and Vaccination* (ib., 1913); W. M. Wanklyn, *How to Diagnose Smallpox* (ib., 1914); C. P. Wertenbaker, *Plan of Organization, or Suppression of Smallpox* (2d ed., Washington, 1914). See COWPOX; JENNER, EDWARD; MEASLES; VACCINATION.

**SMALLWOOD, CHARLES** (1812-73). A Canadian physician and meteorologist. He was born at Birmingham, England, studied medicine, went to Canada in 1853, and settled in practice at St. Martin, Isle Jesus, in 1854. He established a meteorological and electrical observatory which was afterward described in the reports of the Smithsonian Institution. He discovered the action of electricity in forming snow crystals, made researches on ozone in connection with light and on the effect of electricity in the germination of seeds. In 1858 he was appointed professor of meteorology in McGill University. The Canadian government having made him a grant in 1860 for the purchase of magnetic instruments, he began observations in 1861. Upon the establishment of a signal service by the United States, Smallwood connected it with stations in Montreal and other Canadian cities. He contributed frequently to scientific journals in the United States, Canada, and Europe.

**SMALLWOOD, WILLIAM** (1732-92). An American soldier, born in Kent Co., Md. He was colonel of a Maryland regiment in 1776 and served with great gallantry at Long Island, White Plains, Fort Washington, Germantown, and Camden, becoming a brigadier general in 1776 and a major general in 1780. He refused to serve under Baron Steuben in the South, but remained in the army until November, 1783. He was elected to Congress (1785) and was Governor of Maryland (1785-88).

**SMALTITE**, smāl'tit (from *smalt*, from It. *smalto*, enamel, from OHG. *smaltzan*, *smelzan*, Ger. *schmelzen*, to melt; connected with Gk. μέδω, *meldein*, to melt, OHG. *malz*, Ger. *Malz*, AS. *mealt*, Eng. *malt*). A mineral cobalt diarsenide crystallized in the isometric system. It has a metallic lustre and is white to steel gray in color. It occurs associated with other metallic arsenides and sulphides, and with cobaltite in veins. It is one of the commercial sources of the cobalt oxide which is used as a blue coloring matter for glass and pottery. It is sometimes called tin white cobalt, or speisskobalt.

**SMART, CHRISTOPHER** (1722-71). An English poet. He was born at Shipbourne, Kent, and was educated at Cambridge (B.A. 1742), where he took the Seatonian prize for poetry five years in succession. In 1753 he went to London and endeavored to make a living by his pen. He translated the Psalms, Horace, and Phædrus into English verse and made a prose translation of Horace. His works were published in collected form (London, 1791). He became insane through dissipation and privation and died in a debtor's prison in London. His "Song to David," the one poem by which he is remembered, was excluded from the first edition of his works because it was supposed to have been written while he was insane. It appears in part in T. H. Ward, *English Poets*, vol. iii, and was reprinted in 1895 and with introduction by R. A. Streatfield in 1901.

**SMART, HENRY** (1813-79). An English organist and composer, born in London. He held the position of organist at several churches in London and finally (1864) at St. Pancras. That year he lost his sight and in 1879 received a government pension. Among his works are an opera, *Bertha, or the Gnome of Hartzburg* (1855); the cantatas, *The Bride of Dunkerron* (1864), *King René's Daughter* (1871), *The Fisher Maidens* (1871), and *Jacob* (1873). In addition he wrote considerable church music, songs, and part songs. Consult William Spark, *Henry Smart* (London, 1881).

**SMART, JOHN** (1741-1811). An English miniature painter. He was born near Norwich and studied under Daniel Dodd and at Shipley's Academy. He was the friend and perhaps a pupil of Cosway and ranks highest among English miniaturists of the late eighteenth and early nineteenth centuries. Though quiet and gray in color, his miniatures have never been excelled in precision, modeling, and delicacy of finish. About 1788 he went to India, returning to London in 1797. He is excellently represented in the Morgan collection, New York, and in private collections in England, Hyderabad, and Delhi.

**SMART, WILLIAM** (1853-1915). A British political economist. He was born in Renfrewshire, Scotland, was educated at the University of Glasgow, and until 1884 was a manufacturer. Between 1886 and 1896 he was lecturer on political economy in University College, Dundee, in Queen Margaret College, Glasgow, and in Glasgow University. At the last-named institution he was Adam Smith professor of political economy from 1896 till his death. He was elected president of the economic section of the British Association in 1904 and in 1905 was appointed a member of the Royal Commission on the Poor Laws. His publications include: *An Introduction to the Theory of Value* (1891); *Studies in Economics* (1895); *Taxation of Land Values and the Single Tax* (1900); *The Return to Protection* (1904); *Economic Annals of the Nineteenth Century, 1801-20* (1910), besides contributions to economic periodicals.

**SMEATON, smē'ton, JOHN** (1724-92). A British engineer, born at Ansthorpe, near Leeds. He was educated for the bar, but followed his mechanical tastes and became an instrument maker, pursuing in the meantime scientific study and investigation. In 1754 he studied the canals and other great engineering works in Holland and a few months after his return was called to replace the second Eddystone lighthouse. The new structure erected from his plans (1756-59) was considered a model of engineering. After it had been standing about 120 years it was found necessary to replace it by a new lighthouse. (See LIGHTHOUSE.) Afterward he built bridges at Perth, Banff, and Coldstream, the North Bridge at Edinburgh, and the Hexham Bridge. The Forth and Clyde Canal was the most important of his canal work. He also made harbor improvements at Ramsgate. In 1769, after considerable experimental work, he began the construction of steam engines of greater size and length of stroke than had previously been built, in which numerous improvements were introduced. Smeaton's improvements on Newcomen's engine did much to increase its range of usefulness, and engines designed by him were exported to the continent of Europe. He also engaged in astronomical

researches. A small club of engineers, founded by him in 1771, afterward became the Institution of Civil Engineers. His engineering work is described in three volumes of *Reports*, published in 1812. Consult Samuel Smiles, *Lives of the Engineers—Smeaton and Rennie* (London, 1861; new ed., 1904).

**SMEDLEY, FRANCIS EDWARD** (1818-64). An English novelist. Unable to attend public school and university because of a malformation of the feet, he was educated by private tutors and for a long time lived at Chesterton, near Cambridge, with his uncle, Edward Arthur Smedley, chaplain of Trinity College. There he saw much of student life and subsequently he turned his experiences to good use. He edited *Sharpe's London Magazine* two years, and wrote *Frank Fairleigh* (1850), *Lewis Arundel* (1852), and *Harry Coverdale's Courtship* (1855); with Edmund Yates, *Mirth and Metre* (1855).

**SMEDLEY, WILLIAM THOMAS** (1858- ). An American landscape and portrait painter and illustrator. He was born in Chester Co., Pa., and studied at the Pennsylvania Academy and under Laurens in Paris. In 1880 he opened a studio in New York. In his suave and typical illustrations of modern life, especially of the wealthier classes, contributed to *Harper's Magazine* and other periodicals, he displayed the same subtle psychological analysis which later distinguished his painted portraits. In 1882 he traveled with the Marquis of Lorne and illustrated his *Picturesque Canada*. He became a National Academician in 1905, received various prizes, and is represented in the National Gallery, Washington.

**SMEERENBERG**, smä'ren-bêrk. A former Dutch settlement on the extreme west coast of Spitzbergen, founded in 1623. It was a busy and important whaling station, but declined in about 20 years.

**SMELL**. The sensations set up through the stimulation of the end organs of the olfactory nerve by odorous particles in the current of inspired air. The ultimate number of smell qualities is difficult to determine. Like tastes, odors come to us highly fused with affective qualities, with other sensations, pressure, temperature, tickling, or pain, and with secondary effects—drowsiness, sneezing, weeping. (Cf. the effects of carbon disulphide, chlorine, acetic acid.) In 1896 Aronsohn suggested a method of classification by exhaustion. A given substance is smelled until entire fatigue (perhaps better, adaptation) ensues; other substances are then applied with the result that some remain at their normal intensity, others possess a lessened intensity, and others are entirely imperceptible. Thus, after exhaustion by iodine, cajuput is strong, mace weak, pine imperceptible; after exhaustion by camphor, cajuput is very faint; mace strong, pine faint. Certain smells are compensatory; if given simultaneously, they cancel one another. Compensation, it should be noted, is not the mere swamping of one odor by the sheer intensity of a second, often observed in actual life, e.g., in the operating room; it is a complete nullification of olfactory sensation, comparable to producing neutral gray by the mixture of complementary colors. There are also smell contrasts. See **CHEMICAL SENSE IN ANIMALS**; **INTENSITY OF SENSATION**; **NOSE**.

**Bibliography.** M. von Vintschgau, "Physiologie des Geruchssinns," in Hermann, *Handbuch der Physiologie*, vol. iii (Leipzig, 1880); Aron-

sohn, in *Archiv für Anatomie und Physiologie* (ib., 1886); H. Zwaardemaker, *Die Physiologie des Geruchs* (ib., 1895); Gamble, in *American Journal of Psychology*, vol. x (Worcester, 1898); E. B. Titchener, *Experimental Psychology* (New York, 1901); W. A. Nagel, "Geruchssinn," in *Handbuch der Physiologie des Menschen*, vol. iii (Brunswick, 1905); Oswald Külpe, *Outlines of Psychology* (Eng. trans. by E. B. Titchener, new ed., London, 1909); E. B. Titchener, *Text-book of Psychology* (New York, 1910).

**SMEL/LIE, WILLIAM** (1740-95). A Scottish printer and antiquary, born in Edinburgh. From the grammar school he passed to an Edinburgh printing house, performing his duties with efficiency and attending lectures at the university. In 1765 he began business as printer in conjunction with a fellow apprentice. The firm brought out the first edition of the *Encyclopædia Britannica* (1771). Of Smellie's works, which include several biographies, the most popular was *The Philosophy of Natural History* (completed by his son in 1799).

**SMELLING SALTS.** See **SALT**; **SPRING**.

**SMELT** (AS. *smelt*; perhaps connected with *smcolt*, *smylt*, smooth). One of a genus (*Osmerus*) of fishes of the family Argentinidae, sometimes included under the Salmonidae. They are merely reduced salmon, from which they differ principally in the form of the stomach and in their smaller size. They are slender, delicate fishes, inhabiting the coasts of Europe and North America; some enter rivers to spawn. Their flesh is most delicate, and they are highly valued as food. There are only a few species. The common European smelt is *Osmerus eperlanus*, called spirling or spurling in Scotland and éperlan in France. It grows to be about 8 inches long and is abundant. The American smelt (*Osmerus mordax*) is very closely related to the European species, attains a length of about 12 inches, and is abundant along the Atlantic coast of the United States from Virginia to the Gulf of St. Lawrence. It ascends streams to spawn and has become landlocked in lakes in New England, where it thrives and is important not only for the markets, but especially as food for salmon and trout. On the California coast and northward to Alaska occurs an important species (*Osmerus thaleichthys*), and a common species of the Far East is *Osmerus japonicus*.

See **FISHERIES**, and Colored Plate of **PHILIPPINE FISHES**; Plate of **WHITEFISH, SMELTS, ETC.**; also Plate of **MULLETS AND ALLIES** for California smelt.

**SMELTING.** See *Metallurgy* in the articles on **COPPER**; **GOLD**; **IRON AND STEEL**; **SILVER**; and other metals.

**SMENDES**, smén'déz. See **HER HOR**.

**SMERDIS** (Lat., from Gk. *Σμερδης*, *Smerdis*). A son of Cyrus. At his father's death the young prince controlled several provinces in eastern Iran, but he was soon put to death by his elder brother, Cambyses II (q.v.). During the absence of Cambyses in Egypt a Magian named Gaumata, who closely resembled Smerdis, impersonated the dead man, since the murder was not generally known. The rebellion begun by this pseudo-Smerdis in 522 became so dangerous that, if the inscription of Darius Hystaspis (see **DARIUS**), the earliest record of these events, may be trusted, the entire Persian Empire was in commotion. He was finally slain by conspirators after having reigned seven months. Consult Wilhelm Hutecker, *Ueber den falschen*

*Smerdis* (Königsberg, 1885); H. C. Tolman, *The Behistun Inscription of King Darius* (Nashville, 1908).

**SMET**, PETER JOHN DE (1801-73). A Roman Catholic missionary to the Indians. He was born in Termonde, Belgium, was educated at the episcopal seminary at Mechlin, and in 1821 embarked for the United States. He was received into the Jesuit Order at Whitmarsh, Md., and in 1828 went to Saint Louis, participated in the establishment of the University of Saint Louis, and became one of its professors. In 1838 he entered upon the work that occupied him the remainder of his life, first among the Potawatamie Indians and later among the Flatheads of the Rocky Mountains, in whose behalf he made several visits to Europe, collecting money and enlisting recruits as missionaries and teachers. He wrote: *Letters and Sketches and Residence in the Rocky Mountains* (1843; also in *Early Western Travels*, ed. by R. G. Thwaites, vol. xxvii, Cleveland, 1906); *Oregon Missions and Travels Over the Rocky Mountains in 1845-46* (1847); *Western Missions and Missionaries* (1863); *New Indian Sketches* (1865). Consult his *Life, Letters, and Addresses*, edited by Chittenden and Richardson (4 vols., New York, 1904); E. Lavelle, *The Life of Father De Smet* (ib., 1915).

**SMETANA**, smä'tä-nä, FRIEDRICH (1824-84). A Bohemian composer and pianist, born in Leitomischl. He studied music under Proksch of Prague, and later with Liszt. He founded a music school in Prague, but in 1856 went to Sweden, where he became conductor of the Philharmonic concerts at Gothenburg. Returning to Prague in 1866, he became kapellmeister at the National Bohemian Theatre. A gradual loss of the sense of hearing, resulting in complete deafness, compelled him to resign his post in 1874. Smetana's works are thoroughly Bohemian, and as a national composer he is of the greatest importance. But his instrumental works have won a lasting place in the repertoire of the best orchestras throughout the world. His works include the following operas: *The Bartered Bride* (1866); *Dalibor* (1868); *Two Widows* (1874); *The Kiss* (1876); *The Secret* (1878); *Libussa* (1881), and *The Devil's Wall* (1882); the symphonic poems, *Richard III.* (1858); *Wallensteins Lager* (1859); *Hakon Jarl* (1861); *My Country*, comprising six independent works (1874-79); and other symphonies, string quartets, and smaller compositions. He died in the Prague lunatic asylum. Consult F. V. Krejčí, *Friedrich Smetana* (Berlin, 1907); W. Ritter, *Smetana* (Paris, 1907).

**SMET DE NAEYER**, nä'yér, PAUL, COUNT DE (1843- ). A Belgium statesman, born at Ghent. He was elected in 1886 to the chamber of deputies, where he became the leader of the conservative-clerical party. He became minister of finance in 1894 and premier in 1896, continuing to hold that office until 1907, with the exception of the first six months in 1899. In 1900 he was created a count. In 1910 he declined renomination to the chamber, but became a member of the senate.

**SMETHWICK**, sméth'ík. A municipal borough in Staffordshire, England, 3 miles northwest of Birmingham (Map: England, E 4). It is an important manufacturing centre with iron, machine, glass, chemical, and other works. The municipality owns gas and electric lighting plants and garden allotments and maintains a

free library and reading rooms, a park, public baths, and an isolation hospital. Pop., 1901, 54,539; 1911, 70,681.

**SMEW** (probably a variant of *smee*, *smeath*, perhaps from MDutch *smeente*, Dutch *smient*, widgeon). A small merganser (*Merganser albellus*), which abounds from Lapland to Kamchatka, but not east of Bering Strait, and visits Europe in winter. It is a very handsome bird, the plumage of the male being chiefly white, marked with black and gray, and on the head with green.

**SMIBERT**, JOHN. See SMYBERT, JOHN.

**SMICHOW**, smě'kóf. A town of Bohemia, Austria, on the river Moldau, opposite Prague, of which city it is an important suburb and with which it is connected by the Palaky Bridge. The town contains a municipal building and a botanical garden. There are a large wagon factory, rattan-furniture factories, chocolate and confectionery establishments, and flour mills. Pop., 1900, 47,135; 1910, 47,857, mostly Czechs.

**SMIKE**. A miserable, half-witted drudge at Squeer's school, in Dickens's *Nicholas Nickleby*.

**SMILACEÆ**, smí-lá'sè-è. A group of monocotyledonous, generally climbing herbs and shrubs, regarded by some botanists as a distinct family and by others as a tribe of the family Liliaceæ. It includes three genera and about 250 species, natives of warm and temperate regions. Most of the species belong to *Smilax* (q.v.), the only genus represented in North America.

**SMILAX** (Lat., from Gk. *σμίλαξ*, *yew*). A genus of about 225 species, mostly herbs and

GREENBRIER (*Smilax rotundifolia*).

woody climbing or trailing plants, best represented in the temperate and tropical parts of Asia and America. (For family relationship, see SMILACEÆ.) In some species (the greenbriers) the stems are often very prickly. The roots or rootstocks of a number of species, particularly

*Smilax officinalis*, *Smilax medica*, and *Smilax papyracea* of Central and South America, yield sarsaparilla. The fleshy, starchy rhizomes of others (*Smilax china* of eastern Asia and *Smilax pseudo-china* of the southern United States) have similar properties and are sometimes used—the former as food, the latter as medicine. There are a dozen American species, the best known being *Smilax herbacea*, carrion flower, with herbaceous stems, and *Smilax rotundifolia*, the greenbrier or horse brier. The smilax used for decorative purposes is *Asparagus medeoloides*, or *Asparagus asparagoides*, a native of South Africa.

**SMILES, SAMUEL** (1812–1904). An English writer, born at Haddington, Scotland. He studied medicine at the University of Edinburgh. At 20 he began practice at Haddington and later at Leeds. He subsequently gave up his profession to assume the editorship of the radical *Leeds Times*. In recognition of his services to letters, the University of Edinburgh honored him with the degree LL.D. (1878). As early as 1827 Smiles published, at his own expense, *Physical Education*, and in 1857 a *Life of George Stephenson*. His *Lives of the Engineers* appeared in 1861–62 (new ed., 5 vols., 1904). There followed biographies of James Brindley, Boulton and Watt, Thomas Telford, Robert Dick, George Moore, Josiah Wedgwood, James Nasmyth, and others. He gained immense success with *Self Help* (1859), practical talks to young men. It has been translated into seventeen languages. Among his many works, similar books are *Character* (1871), *Thrift* (1875), *Duty* (1880), and *Life and Labor* (1887). Consult his *Autobiography*, ed. by T. Mackay (New York, 1905).

**SMILEY, smi'li, ALBERT KEITH** (1828–1912). An American humanitarian, born at Vassalboro, Me., of Quaker stock. In 1849 he graduated from Haverford College, where he was an instructor until 1853. With his twin brother, Alfred H. Smiley, he founded and was principal of the English and Classical Academy, Philadelphia, in 1853–57. He then served as principal of schools in his native town in 1858–59, and at Providence, R. I., in 1860–79. His name is known in connection with the remarkable summer resort which he was instrumental in building up at Mohonk Lake (q.v.) and the conferences which he initiated (see LAKE MOHONK CONFERENCE). In 1889, with his brother Alfred, who was also associated with him at Mohonk, he purchased a large tract of land at Redlands, Cal., part of which he made into a park, and here he spent his winters. See also SMILEY, DANIEL.

**SMILEY, DANIEL** (1855– ). An American humanitarian. He was born at Vassalboro, Me., and graduated at Haverford College in 1878. He was instructor in Greek and Latin at the William Penn Charter School, Philadelphia, 1878–81; with his brother, Albert K. Smiley (q.v.), managed the noted resort at Lake Mohonk, N. Y., and became in 1912, on his brother's death, owner of the Lake Mohonk estate and of Cañon Crest Park, Redlands, Cal. In 1882 he became associated in the management of the Lake Mohonk Conferences. In 1912 he was appointed a member of the United States Board of Indian Commissioners.

**SMILLIE, smi'li, GEORGE HENRY** (1840– ). An American landscape painter, brother of James D. Smillie. He was born in New York

and was a pupil of his father, James Smillie, an engraver, and of James Hart. He became a member of the National Academy of Design in 1882. His landscapes, modern in style and skillfully executed, are distinguished by brightness and gaiety. Examples are in the Metropolitan Museum, New York; the Corcoran Gallery, Washington; the Union League Club, Philadelphia; and the Lotos Club, New York.

**SMILLIE, JAMES DAVID** (1833–1909). An American engraver, etcher, and landscape painter, brother of George H. Smillie. Born in New York, he studied at the National Academy of Design and under his father James Smillie, an engraver, with whom he collaborated until 1862, working chiefly at bank-note vignettes. He also did illustrations, notably a series for Cooper's novels. From 1862 to 1864 he traveled in Europe and upon his return took up landscape painting. He became a member of the National Academy of Design in 1876 and was one of the founders and president of the American Water-Color Society and of the New York Etching Club. His landscapes in oil and water color, including many of American mountain scenery, are skillfully executed and modern in conception. He possessed extraordinary mastery of the technique of etching, dry point, aquatint, and mezzotint, excelling particularly in flower pieces drawn from nature.

**SMIRKE, SIR ROBERT** (1781–1867). An English architect, born in London. He studied under Sir John Soane and in the schools of the Royal Academy, winning the gold medal for design in 1799. After visiting Greece and Sicily he began to practice his profession as an architect in London in 1805. Among his works in the classic style are the College of Physicians, the Post Office, the Mint, and the British Museum, the main façade of which is his best-known work. In the Gothic style are his extension of the Inner Temple and restoration of York Minster. He published *Specimens of Continental Architecture* (1806). His brother, SIR NEY SMIRKE (1799–1877), also an architect, designed the great circular reading room of the British Museum.

**SMITH, ADAM** (1723–90). A British political economist, regarded as the founder of economics as a separate branch of human knowledge. He was born at Kirkcaldy in Fifeshire, Scotland, June 5, 1723. He studied at the University of Glasgow and won there an exhibition on the Snell foundation, which took him to Balliol College, Oxford. There he remained seven years. In 1748 he was in Edinburgh, where he delivered a course of lectures upon rhetoric and belles-lettres. These seem to have given him a reputation as a scholar and to have introduced him to learned and accomplished men, of whom the most famous was David Hume. The friendship thus begun was an important one for Smith, who remained friendly with Hume during his life. In 1751 Adam Smith was appointed professor of logic at the University of Glasgow and a year afterward was transferred to the chair of moral philosophy.

In 1759 he published his first work, *The Theory of Moral Sentiments*, still well-known in the history of ethics. In 1763 he became tutor to the young Duke of Buccleuch and accompanied him in France. He spent a year or more in Paris and met the more important men of letters of France. He was particularly attracted by

the group who termed themselves Economistes and who are better known as Physiocrats. Quesnay, the leader of the school, and several of his followers were in the circle of Smith's acquaintance. He became familiar with the theories of the Physiocrats, which exercised a great influence upon him. In 1766 he returned to Kirkcaldy. He was now engaged in the preparation of his great work, *An Inquiry into the Nature and Causes of the Wealth of Nations*, which first appeared in 1776. The work made a great impression. Five editions were printed during the lifetime of the author, and before the close of the century it had been translated into the principal European languages. (For its place in economic thought, see POLITICAL ECONOMY.) In 1778 Smith was appointed a Commissioner of Customs for Scotland, and he took up his official residence in Edinburgh. In 1787 he was elected Lord Rector of the University of Glasgow. He died in Edinburgh, July 17, 1790.

**Bibliography.** MacCulloch, "Sketch of the Life and Writings of Adam Smith," in *Treatises and Essays on Money* (Edinburgh, 1859); R. B. Haldane, *Life of Adam Smith* (London, 1887); John Rae, *Life of Adam Smith* (ib., 1895); Prida, *Economic Science and Practice* (ib., 1896); Walter Bagehot, *Biographical Studies* (ib., 1899); F. W. Hirst, *Adam Smith* (ib., 1904); A. W. Small, *Adam Smith and Modern Sociology* (Chicago, 1907).

**SMITH, SIR ALBERT JAMES** (1824-83). A Canadian statesman. He was born at Shediac, New Brunswick, and was called to the bar in 1847. He was a Liberal member of the New Brunswick Legislative Assembly in 1851-67 and in 1856 a member of the executive council without portfolio. He became Attorney-General of the province in 1862, led the party opposed to Confederation and went to England in that behalf in 1865. In 1864-66 he was Premier of New Brunswick. After Confederation he was elected to the House of Commons, was Minister of Marine and Fisheries in the Mackenzie administration (1873-78), and in 1877 was chief counsel of the Canadian government before the Halifax Fisheries Commission. In 1878 he was knighted (K.C.M.G.).

**SMITH, ALBERT RICHARD** (1816-60). An English author and lecturer, born at Chertsey, Surrey. For a short time he practiced medicine. Primarily a humorist, he was a contributor to *Punch* in its early years and to *Bentley's Miscellany*, where his book, *The Adventures of Mr. Ledbury* (1842), first appeared serially. He also wrote extravaganzas and adapted certain of Dickens's stories for stage presentation. His ascent of Mont Blanc in 1851 provided him with the material for one of several popular lectures, or entertainments, at Egyptian Hall, London. He wrote several novels: *Christopher Tadpole* (1848); *Pottleton's Legacy* (1849); *Wild Oats and Dead Leaves* (1860), and books of satiric essays and sketches, illustrated by favorite artists of the day.

**SMITH, ALBERT WILLIAM** (1856- ). An American mechanical engineer, born at Westmoreland, N. Y. He graduated from Cornell University in 1878 and in 1887-91 was assistant professor of mechanical engineering at Sibley College (Cornell), of which he became director in 1904. In the meantime he had been professor of machine design at the University of Wisconsin in 1891-92 and professor of mechanical engi-

neering at Leland Stanford Junior University from 1892 to 1904. He published: *Elementary Machine Design* (1895); *Material of Machines* (1902; 2d ed., 1914); *Machine Design* (1905; 4th ed., 1915), with G. H. Marx; *The Giant and Other Nonsense Verse* (1910).

**SMITH, ALEXANDER.** See ADAMS, JOHN (1760-1829).

**SMITH, ALEXANDER** (1830-67). A Scottish poet, born at Kilmarnock. His *Life Drama* (1853) created a sensation. Its richness and originality of imagery may perhaps atone for its many sins against taste and knowledge. In 1855, with Sidney Dobell, he published a volume of *Sonnets on the Crimean War*. He also wrote *City Poems* (1857), *Edwin of Deira* (1861), and several prose works, as *Dreamthorp* (1863), notable essays; *A Summer in Skye* (1865); *Alfred Hagart's Household*, a story of Scottish life (1866), and its sequel, *Miss Dona McQuarrie* (1867). After his death appeared *Last Leaves* (London, 1868). Smith was classed with Philip James Bailey, Sydney Dobell, and Gerald Massey (qq.v.) as a member of the Spasmode school. The epithet was first used in *Blackwood's Magazine* for May, 1854. Consult Brisbane, *Early Years of A. Smith* (London, 1869).

**SMITH, ALEXANDER** (1865-1922). An American chemist, born in Edinburgh, Scotland. He graduated from the university of his native city in 1886 and received the degree of Ph.D. at Munich in 1889. After coming to the United States he was professor of chemistry and mineralogy in Wabash College (1890-94) and then till 1911 was a member of the faculty of the University of Chicago. In 1911 he was called to Columbia University to be professor and head of the department of chemistry, and in the same year he held the presidency of the American Chemical Society. He was elected to the National Academy of Sciences in 1915. His publications include: *Laboratory Outline of General Chemistry* (1899); *The Teaching of Chemistry and Physics* (1902), with E. H. Hall; *Introduction to General Inorganic Chemistry* (1906; 2d ed., 1912); *General Chemistry for Colleges* (1908; rev. ed., 1916); *A Text-Book of Elementary Chemistry* (1914).

**SMITH, ALFRED H. (OLLAND)** (1864-1924). An American railroad president. He entered the service of the Lake Shore and Michigan Southern Railway as a messenger boy in 1879, served afterward in various minor capacities, and was superintendent of various divisions from 1890 to 1901, assistant general superintendent and, in 1901-02, general superintendent. Thereafter he was with the New York Central and Hudson River Railroad as general superintendent (1902-03), general manager (1903-12), vice president (1906-13), and president of the system and its subsidiary lines after 1914.

**SMITH, ANDREW JACKSON** (1815-97). An American soldier, born in Berks Co., Pa. He graduated at West Point in 1838, served on the southwest frontier and in the Mexican War, and afterward against the Indians in Oregon and Washington Territory. In the Civil War he was commissioned colonel of the Second California Cavalry. He served as chief of cavalry in the departments of the Missouri and the Mississippi up to 1862 and was then commissioned brigadier general of United States volunteers. He was at the siege of Corinth in the Yazoo River expedition (1862), in the attack on Arkansas Post (1863), and in the Vicksburg

campaign. Subsequently he commanded a division in the Sixteenth Army Corps, took part in Banks's Red River expedition, and for services at the battle of Pleasant Hill, La., April 9, 1864, he received the brevet of colonel in the regular army. He became major general of volunteers, May 12, 1864; later he participated in the battle of Nashville (1864), receiving for services in that struggle the brevet rank of major general in the regular army. He took command of the Sixteenth Army Corps in February, 1865, and was with it in the Mobile campaign and in operations against Montgomery. In January, 1866, he was appointed colonel of the Seventh Cavalry. In May, 1869, he resigned from the army and was appointed postmaster at St. Louis, Mo.

**SMITH, ARCHIBALD CAREY** (1837-1911). An American naval architect, born in New York City. He learned boatbuilding under Robert Fish and in 1860 built the sloop *Comet*, which held the American championship for several years. Later he built the *Vindex*, the first iron vessel built in the United States. He designed the *Mischief*, which successfully defended the *America's* Cup against the *Atalanta* in 1881, and superintended the construction of the *Priscilla*, which was defeated by the *Puritan* and the *Mayflower* in 1885. In 1911 he designed and built the schooner *Enchantress*, the winner of the King's Cup. Other vessels designed by him were the *Iroquois*, the *Meteor* for the German Emperor, the motor boats *Ailsa Craig* and *Eronel*, and several steamboats.

**SMITH, BENJAMIN BOSWORTH** (1794-1884). An American Protestant Episcopal bishop. He was born at Bristol, R. I., and graduated at Brown University in 1816. The following year he was ordained, beginning his ministry at Marblehead, Mass. He held several pastoral charges and was for a time editor of the *Episcopal Recorder* of Philadelphia. His last rectorship, in Lexington, Ky., he held until 1837, though in 1832 he had become Bishop of the diocese. While he was presiding Bishop (from 1868) was organized the separatist movement which became the Reformed Episcopal church, under the leadership of Bishop Smith's own assistant bishop, George David Cummins. He published *Saturday Evening* (1876) and *Apostolic Succession* (1877).

**SMITH, BENJAMIN ELI** (1857-1913). An American editor, son of Eli Smith. He was born at Beirut, Syria, and was educated at Amherst College (A.B., 1877; A.M., 1881), which gave him the degree of L.H.D. in 1902. Of the *Century Dictionary* he was managing editor from 1889 to 1891 and editor after 1894. As editor he was responsible also for the *Century Cyclopaedia of Names* (1894), the *Century Atlas* (1897), the two-volume *Century Dictionary Supplement* (1909), and the revised and enlarged *Century Dictionary, Cyclopaedia, and Atlas* (12 vols., 1911). In addition he edited selections from Marcus Aurelius (1899), Epictetus (1900), and Pascal (1902), and translated Schwegler's *History of Philosophy* (1879) and Cicero's *De Amicitia* (1897).

**SMITH, BUCKINGHAM** (1810-71). An American antiquary, born on Cumberland Island, Ga. He graduated at the Harvard Law School in 1836, practiced in Maine, but removed to Florida and became a member of the Territorial Legislature. From 1850 to 1852 he was Secretary to the United States Legation in Mexico and acted

as chargé d'affaires in 1851. Here he studied Indian philology and began to collect material on the Spanish exploration and settlement of America. While Secretary of Legation at Madrid (1855-58) he collected further material from the Spanish archives. He returned to Florida in 1859 and became a judge and a member of the State Senate. Among his translations and other publications are: *Relation of Alvar Nuñez Cabeza de Vaca* (1851; new ed., 1871); *Grammar of Pima or Nevome, a Language of Sonora* (1862); *Narratives of the Career of Hernando de Soto in the Conquest of Florida* (1866).

**SMITH, CHARLES EMORY** (1842-1908). An American journalist and politician. He was born at Mansfield, Conn., and graduated at Union College in 1861. In 1865 he became editor of the *Albany Express* and in 1870 of the *Albany Journal*. For many years he took an active interest in politics as a Republican and stood high in the party's councils. From 1880 to 1898 he conducted the *Philadelphia Press*. While American Minister to Russia (1890-92), he was active in distributing supplies to the famine sufferers in that country. In 1898-1902 he was Postmaster-General of the United States. During his administration rural mail routes were established.

**SMITH, CHARLES FERGUSON** (1807-62). An American soldier, born in Philadelphia, Pa. He graduated at West Point in 1825 and served with distinction through the Mexican War. During the Civil War he rose to the rank of major general in the Federal army and was for some time commander of the District of Western Kentucky. He led the decisive charge at Fort Donelson, and soon afterward he was given command of the troops sent up the Tennessee. During these movements he was accidentally injured, and died April 25, 1862.

**SMITH, CHARLES FORSTER** (1852- ). An American classical scholar, born in Abbeville Co., S. C. He was educated at Wofford College (A.B., 1872), Harvard (1874), Berlin (1875), and Leipzig (Ph.D., 1881). Smith was professor of classics and German at Wofford in 1875-79, assistant professor of Latin and Greek at Williams in 1881-82, and professor of modern languages (1882-83) and of Greek (1883-94) at Vanderbilt University. Thenceforth he was professor of Greek and classical philology at the University of Wisconsin. In 1903 he served as president of the American Philological Association. He edited several volumes of Thucydides, Xenophon's *Anabasis* (1905), and Herodotus, vii (1907); translated Hertzberg's *History of Greece* (1900); and is author of *Reminiscences and Sketches* (1909).

**SMITH, CHARLES HENRY** (1826-1903). An American humorist, born at Lawrenceville, Ga. He graduated at Franklin College, Athens, and became a lawyer at Rome, both in his native State. Later he served in the Confederate army. After the war he removed to Cartersville, Ga. He was widely known for his newspaper letters, under the signature "Bill Arp," which began in 1861 and with their homely genuine humor cheered the hearts of the Southern people. The letters were subsequently collected as *Bill Arp's Letters* (1868), to which were added *Bill Arp's Scrap Book* (1896) and other volumes.

**SMITH, CHARLOTTE** (1749-1806). An English poet and novelist, eldest daughter of Nicholas Turner of Stoke House in Surrey

Through misfortune and separation she began to support herself and her children by literary work. She gained the attention of the London literary world with *Elegiac Sonnets and Other Essays* (1784), a volume which passed through many editions. Her wider public was won by a series of novels describing contemporary life. Among them are *Emmeline* (1788), *Desmond* (1792), and *The Old Manor House* (1793). Consult the memoir and generous estimate of Charlotte Smith, and criticism of her work, by Sir Walter Scott in his *Miscellaneous Prose Works*, vol. i (Edinburgh, 1834-36).

**SMITH, CLEMENT LAWRENCE** (1844-1909). An American Latin scholar, born at Upper Darby, Pa., and educated at Haverford College, at Harvard, and in Europe. In 1869-70 he was professor of Greek and German at Swarthmore College, and was then called to Harvard as tutor in Latin. He became assistant professor in 1873 and was professor from 1883 to 1904. He was also dean of Harvard College from 1882 to 1901 and of the faculty of arts and sciences from 1898 to 1902. In 1897-98 he was director of the American School of Classical Studies at Rome. With Professor Tracy Peck of Yale he edited the *College Series of Latin Authors*. In this series he edited *The Odes and Epodes of Horace* (Boston, 1894).

**SMITH, DAVID EUGENE** (1860- ). An American mathematician and educator. He was born at Cortland, N. Y., where, after graduating from Syracuse University (1881), he practiced law and then was a teacher in the State Normal School (1884-91); meanwhile he took his Ph.D. at Syracuse in 1887. Subsequently he became professor in the Michigan State Normal College (1891), the principal of the State Normal School at Brockport, N. Y. (1898), and professor of mathematics in Teachers College, Columbia University (1901). He was elected member or fellow of various American and foreign societies and in 1905 received the degree of LL.D. from Syracuse. Besides serving as editor of the *Bulletin of the American Mathematical Society* and being prominently identified with other mathematical journals, he contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA* and published a series of textbooks and *History of Modern Mathematics* (1896; as a separate work, 1910); *The Teaching of Elementary Mathematics* (1900), *The Teaching of Arithmetic* (1909; rev. ed., 1913), and *The Teaching of Geometry* (1912); *Rara Arithmetica* (1908); *A Bibliography on the Teaching of Mathematics* (1912), with C. Goldziher; and *A History of Japanese Mathematics* (1914), with Y. Mikami. With George Wentworth, Smith was joint author of a large number of textbooks, and with W. W. Beman he wrote various textbooks and translated F. Klein's *Famous Problems of Geometry* and Fink's *History of Mathematics*. In 1915 he edited Augustus De Morgan's *Budget of Paradoxes*.

**SMITH, DONALD ALEXANDER.** See STRATHCONA and MOUNT ROXAL.

**SMITH, EDGAR FAHS** (1856- ). An American chemist and educator, born in York, Pa. He graduated at Pennsylvania College in 1874 and at Göttingen, Germany (Ph.D.), in 1876. After serving as instructor at the University of Pennsylvania and as professor at Muhlenberg and Wittenberg colleges, he held a chair of chemistry at the University of Penn-

sylvania from 1888 to 1911. In 1899 he became vice provost of the University, and, in 1911, provost. In recognition of his many important original contributions to chemistry, especially in the domain of electrolytic methods of analysis and of atomic weight determinations, he was elected to membership in the National Academy of Sciences and to the presidency of the American Philosophical Society and the American Chemical Society. He translated Richter's textbooks of inorganic and organic chemistry and wrote: *Electro-Chemical Analysis* (5th ed., 1911); *Theories of Chemistry* (1913); *Elements of Electro-Chemistry* (1913); *Chemistry in America* (1914).

**SMITH, EDMUND KIRBY** (1824-93). An American soldier, born at St. Augustine, Fla. He graduated at West Point in 1845. In the Mexican War he was brevetted first lieutenant for gallantry at Cerro Gordo and captain for bravery at Contreras and Churubusco. From 1849 to 1852 he was assistant professor of mathematics at West Point. He became first lieutenant in 1851, captain of the Second Cavalry in 1855, and major in 1861. He resigned from the army April 6, 1861, was appointed lieutenant colonel of cavalry of the Confederates, and became brigadier general June 17, 1861. He was chief of staff under Gen. Joseph E. Johnston in the Shenandoah valley during June and July, bringing in the fresh troops which decided the first battle of Bull Run (July 21), but was severely wounded. He became major general in 1861 and in 1862 was placed over the District of East Tennessee and afterward of the Department of East Tennessee, Kentucky, North Georgia, and Western North Carolina. He led the advance of Bragg's army into Kentucky, defeated Nelson at Richmond (near Lexington), Aug. 30, 1862, gathered men and threatened Cincinnati. On Oct. 9, 1862, he became lieutenant general and in February, 1863, was assigned to the Trans-Mississippi Department. He became general, Feb. 19, 1864, and in April baffled Banks's unfortunate Red River expedition. He finally surrendered to General Canby in May, 1865. From 1866 to 1868 Smith was president of the Atlantic and Pacific Telegraph Company, from 1870 to 1875 was chancellor of the University of Nashville, and from 1875 until his death was professor of mathematics in the University of the South at Sewanee, Tenn.

**SMITH, ELI** (1801-57). An American Protestant missionary and scholar. He was born at Northford, Conn., graduated from Yale in 1821 and from Andover Theological Seminary in 1826. The same year he was put in charge of the printing establishment of the American Board at Malta and remained there until 1829, except for a period spent at Beirut in studying Arabic. In 1829 he traveled through Greece, later through Armenia and Georgia to Persia in company with H. G. O. Dwight, and published the results of their observations in *Missionary Researches in Armenia* (2 vols., 1833). The Armenian and Nestorian missions were shortly afterward established by the American Board. In 1833 he settled in Beirut. In 1838 and 1852 he accompanied Edward Robinson (q.v.) on tours of investigation in the Holy Land. He kept up linguistic studies in preparation for what he considered his life work, the translation of the Bible into Arabic, but died after completing the New Testament, the Pentateuch, and part of the prophetic books. The

work was completed by C. V. Van Dyck of the Syrian Mission and published in 1866-67.

**SMITH, ELIZABETH OAKES (PRINCE).** See SMITH, SEBA.

**SMITH, ELLISON DURANT (1866- )**. An American planter and legislator, born at Lynchburg, S. C. He was educated at the University of South Carolina, Wofford College (A.B., 1889), and Vanderbilt University (A.M., 1890). Long a farmer, he became interested in improving methods of growing cotton and in perfecting farmers' organization. As a Democrat he was a member of the Lower House of the South Carolina Legislature from 1896 to 1900. Later he gave his time to betterment of agricultural conditions, organizing the Farmers' Protective Association and becoming the field agent of the Southern Cotton Association. His speeches attracted general attention, and in 1908 he was elected United States Senator. He became a member of the committees on agriculture and immigration and was one of the framers of the Burnett-Dillingham-Smith Immigration Law. In 1914 he was reelected Senator, his opponent being Governor Bleasde.

**SMITH, ERMINNIE ADELLE (PLATT) (MRS. SIMEON H. SMITH) (1836-86)**. An American ethnologist, born at Marcellus, N. Y., and educated at Mrs. Willard's seminary in Troy (now called the Emma Willard School). She was married in 1855. While her sons were being educated in Germany, she studied mineralogy (graduating from the Freiberg Mining Academy) and other sciences. In 1878 she became connected with the Bureau of Ethnology and was detailed to study the dialects, customs, and myths of the Iroquois Indians. For this purpose she spent two summers in Canada among the Tuscaroras (of Iroquoian stock), who adopted her as a member. Her Iroquois English Dictionary was being printed when she died.

**SMITH, ERWIN F. (RINK) (1854- )**. An American plant pathologist. He was born at Gilbert's Mills, N. Y., and was educated at the University of Michigan (B.S., 1886; Sc.D., 1889). Subsequently he was expert pathologist of the United States Department of Agriculture, and later took charge of the laboratory of plant pathology of the Bureau of Plant Industry. He held the presidency of the Society for Plant Morphology and Physiology, of the Society of American Bacteriologists (1906), and of the Botanical Society of America (1910), and in 1913 was elected to the National Academy of Sciences. Besides serving as an associate editor of the *Centralblatt für Bacteriologie* and contributing to the *Standard Dictionary*, he published *Bacteria in Relation to Plant Diseases* (vols. i-iii, 1905-15) and papers and bulletins on bacteriology, general botany, mycology, and sanitary science.

**SMITH, EUGENE ALLEN (1841- )**. An American geologist, born in Autauga Co., Ala. He graduated from the State university in 1862, studied in Berlin and Göttingen in 1865-66, and received the degree of Ph.D. from Heidelberg in 1868. In 1862-65 he was a second lieutenant and captain in the Confederate army. After 1871 he was a professor at the University of Alabama. From 1873 he was also State geologist of Alabama and in 1911 became a member of the State Highway Commission. Smith served as president of the Geological Society of America in 1913.

**SMITH, FRANCIS HENNEY (1812-99)**. An

American soldier, born at Norfolk, Va. He graduated in 1833 at the United States Military Academy and in 1837 was appointed professor of mathematics at Hampden-Sidney College. In 1839 he was selected to be superintendent and professor of mathematics in the newly organized Virginia Military Institute. Soon after the outbreak of the Civil War he was appointed colonel and was stationed at Norfolk and in command of Craney Island Fort. Subsequently he reopened the institute, whose buildings had been destroyed by fire during the war. His publications include: *The Best Methods of Conducting Common Schools* (1849); *College Reform* (1850); *The Virginia Military Institute* (1912), and textbooks on arithmetic and algebra.

**SMITH, FRANCIS HOPKINSON (1838-1915)**. An American author, artist, and engineer, born in Baltimore, Md. His school days ended, he became a clerk in a Baltimore ironworks; subsequently he studied engineering and became a contractor. In this capacity he was engaged in several government works of importance on the Atlantic seaboard, including the construction of the sea walls at Block Island, Governor's Island (New York harbor), and Tompkinsville (Staten Island), the Race Rock Lighthouse, off New London, Conn., and the foundation for the Bartholdi Statue of Liberty. He was proudest of his work as an engineer and considered the Race Rock Lighthouse his greatest achievement. He became known also as a painter in water color and for his charcoal sketches. Although his work often shows a lack of technical training (for he was self-taught), it is not without charm and an intimate feeling for the picturesque. He received various awards and medals and is represented in the public collections of Washington, Baltimore, and Buffalo. Hopkinson Smith was a member of the American Academy of Arts and Letters. He was a great traveler, spending six months every year in foreign lands. As a novelist he was best in portraying Southern types and manners. His *Colonel Carter of Cartersville*, with its Southern gentleman of the old school, was perhaps his finest achievement as a novelist. Among his works are: *Old Lines in New Black and White* (1885); *Well-Worn Roads* (1886); *A Book of the Tile Club* (1887); *A White Umbrella in Mexico* (1889); *Colonel Carter of Cartersville* (1891); *A Day at Laguerre's* (1892); *American Illustrators* (1892); *A Gentleman Vagabond and Some Others* (1895); *Tom Grogan* (1896); *Gondola Days* (1897); *Caleb West, Master Diver* (1898), one of his most successful books; *The Other Fellow* (1899); *The Fortunes of Oliver Horn* (1902); *At Close Range* (1905); *The Wood-Fire in No. 3* (1905); *The Tides of Barnegat* (1906); *The Veiled Lady* (1907); *Peter* (1908); *Kennedy Square* (1911); *Charcoals of New and Old New York* (1912); *The Arm-Chair at the Inn* (1912); *In Thackeray's London* (1913) and *In Dickens's London* (1914), both with sketches. Posthumously appeared a novel *Felix O'Day* and a series of lectures, *Outdoor Sketching* (both 1915).

**SMITH, SIR FRANCIS PETTIT (1808-74)**. An English inventor, born in Hythe. In 1834 he constructed a model of a steam vessel to be propelled by a screw driven by a spring, and three years afterward built a larger boat on the same principle, which he successfully tested in the English Channel. He constructed for the British navy the screw steamer *Archimedes* of 237

tons, 90 horse-power, which he completed in 1840, and the success of which led to the rapid introduction of screw vessels into the English navy and the mercantile marine.

**SMITH, FRED B.** (1864- ). An American evangelist and Y. M. C. A. leader, born at Lone Tree, Iowa. He studied at the State University of Iowa in 1882-83. After some years' experience in similar work, in 1898 he was sent by the International Committee of the Y. M. C. A. to conduct evangelistic meetings at the army camp at Chickamauga and later in Cuba. The years 1899-1901 he spent in visiting city Y. M. C. A. organizations throughout the country, urging them to increase emphasis on the religious side of their work. In 1910 he became international secretary of the Y. M. C. A. He was largely instrumental in the initiation and successful work of the "Men and Religion Forward Movement," which within a few years after 1910 established organizations in 1500 cities and towns. He wrote *Men Wanted* (1911) and *A Man's Religion* (1913).

**SMITH, SIR FREDERICK EDWIN** (1872- ). An English lawyer and statesman. He was born at Birkenhead, was educated at Wadham College, Oxford, and entered on the practice of law. He was extension lecturer in modern history for Oxford University in 1898 and for Victoria University in 1900. In 1906 he was elected Unionist member of the House of Commons for Walton Division, Liverpool. His remarkable success at the bar was recognized when he was made king's counsel and bench of Gray's Inn in 1908. In Parliament he distinguished himself by debating power and knowledge of public questions and came to be considered one of the leaders of the Unionist and Conservative parties. After the outbreak of the European War in 1914, Smith served for a time at the front. In 1915 he became Attorney-General in Asquith's coalition cabinet. In 1915 he was knighted. He published: *Newfoundland* (1906); *Toryism until 1832* (1907); *The Licensing Bill* (1908); *International Law in the Far East* (2d ed., 1908); *International Law* (4th ed., 1911); *Speeches, 1906-09* (2d ed., 1912). Consult A. G. Gardiner, *Pillars of Society* (London, 1913).

**SMITH, GEORGE** (1800-68). An English Wesleyan writer on theology. He was educated in a Lancastrian school. Although he was engaged in business throughout life, he was a careful student of religious doctrines and history. He was the author of: *Religion of Ancient Britain* (2d ed., 1846); *The Hebrew People* (2 vols., 1850); *The Polity of Wesleyan Methodism Exhibited and Defended* (1851; 3d ed., 1852); *The Gentile Nations* (2 vols., 1852); *Wesleyan Local Preacher's Manual* (2d ed., 1855); *The History of Wesleyan Methodism* (3 vols., 1857; 2d ed., 1859); *The Life and Reign of David, King of Israel* (1867).

**SMITH, GEORGE** (1808-99). An American banker, born in Aberdeenshire, Scotland. He was educated at Aberdeen College, emigrated to America, in 1834 settled in Chicago, and for the next quarter of a century was closely identified with the industrial and financial history of the Northwest. In 1837 he was granted a charter for the Wisconsin Marine and Fire Insurance Company at Milwaukee, which allowed him to carry on a general banking business and issue notes to the amount of \$1,500,000. This corporation was for many years the most stable financial institution in the West, and its notes,

payment upon which was never refused, circulated widely and were of great benefit to other banks and to business houses in times of panic. In 1839 he also founded the house of George Smith & Co., the first banking house in Chicago. Subsequently he became interested in banking in the South, but after the outbreak of the Civil War gradually withdrew from active business and retired to London, where he died.

**SMITH, GEORGE** (1824-1901). An English publisher, born in London. In 1843 he took charge of most of the business of Smith and Elder, publishers, and in 1846, on the death of his father, became head of the firm. Under his supervision the early works of John Ruskin were published, Charlotte Brontë's *Jane Eyre* was brought out in 1848, and Thackeray's *Henry Esmond* in 1851. In 1859 Smith founded the *Cornhill Magazine*, with Thackeray as its first editor; and in 1865 he established the *Pall Mall Gazette*, an independent evening paper, retaining control of it until 1880. He projected and published the great *Dictionary of National Biography* (63 vols., 1885-1900) edited by Sir Leslie Stephen and Sir Sidney Lee (qq.v.). Subsequently an index volume and supplements were brought out.

**SMITH, GEORGE** (1840-76). An English Assyriologist, born at Chelsea. He was an engraver by trade. Becoming interested in Assyriology, he gave much of his leisure time and spare money to the study and attracted the favorable notice of Rawlinson. In 1866 he discovered a text relating to the tribute paid by Jehu to Shalmaneser III. His aptitude for arranging and classifying Assyrian documents led to his association with Rawlinson in the preparation of the third and fourth volumes of the *Cuneiform Inscriptions of Western Asia* (published 1870, 1875). In 1867 Smith became connected with the British Museum. In 1871 he published the *Annals of Assur-bani-pal* and prepared valuable papers on the *Early History of Babylonia* and *The Reading of the Cypriote Inscriptions*. In 1872 he made his most famous discovery—the Babylonian account of the deluge, which had been found at Nineveh and brought to England by Layard. As a result he was sent to Nineveh the following year at the expense of the *Daily Telegraph* to search for more fragments of the account and returned in a short time, having succeeded in his mission. He again conducted excavations at Nineveh for the British Museum in 1874. In October, 1875, he started a third time for the East; after many difficulties he reached Nineveh, only to find that it was impossible to excavate, owing to the disturbed state of the country. His health broke down from care and worry, and he died at Aleppo, Aug. 19, 1876. Besides the works already mentioned, he published: *Assyrian Discoveries* (1875), the account of his explorations; *The Assyrian Eponym Canon* (1875); *Ancient History from the Monuments: Assyria* (1875); *The Chaldean Account of Genesis* (1876; ed. by Sayce, 1880); and papers in the *Transactions* of different societies. *Ancient History from the Monuments: Babylonia* (1877) and *The History of Sennacherib* (1878) appeared posthumously.

**SMITH, SIR GEORGE ADAM** (1856- ). A Scottish Hebraist, born at Calcutta, India. He was educated in Edinburgh at the university and at New College. In 1880-82 he was Hebrew tutor at the Free Church College in

Aberdeen; then, until 1892, was pastor of the Free Church, Queen's Cross, Edinburgh; and in that year was named professor of Old Testament language, literature, and theology in the United Free Church College of Glasgow. In 1909 he became principal and vice chancellor of Aberdeen University. Smith traveled in Palestine in 1891, 1901, and 1904; lectured in the United States at Johns Hopkins (1896), Yale (1899), and the University of California (1909); and in 1909 was visiting professor at the University of Chicago. He was also Jowett lecturer in London in 1900 and Schweich lecturer before the British Academy in 1910. In 1916 he was knighted. His writings include: *The Book of Isaiah* (2 vols., 1888-90); *The Preaching of the Old Testament to the Age* (1893); *Historical Geography of the Holy Land* (1894; 16th ed., 1910); *The Twelve Prophets* (2 vols., 1896-97); *The Life of Henry Drummond* (1898; 7th ed., 1902); *Modern Criticism and the Preaching of the Old Testament* (1901); *The Forgiveness of Sins and Other Sermons* (1904); *Jerusalem: The Topography, Economics, and History* (1908); *The Early Poetry of Israel* (1912); "Deuteronomy," in *Cambridge Bible for Schools* (1914); *War and Peace* (1915).

**SMITH, GEORGE GREGORY** (1865- ). A British literary scholar, born in Edinburgh and educated at Edinburgh University and at Balliol College, Oxford. From 1892 to 1905 he was lecturer in English literature and languages at Edinburgh University; from 1905 to 1909 professor of English literature at Queen's College, Belfast; and thereafter professor at the University of Belfast. His publications include notably: *The Days of James IV* (1890); *The Book of Islay* (1895); an edition of *The Spectator* (8 vols., 1897-98; 4 vols., 1907); *The Transition Period* (1900), treating of the literature of Europe in the fifteenth century; *Specimens of Middle Scots* (1902); *Elizabethan Critical Essays* (2 vols., 1904); the Globe edition (1905) of *Pepys's Diary*; *Poems of Henryson* (3 vols., 1906-14).

**SMITH, GEORGE OTIS** (1871- ). An American geologist, born at Hodgdon, Me. He graduated from Colby College in 1893 and from Johns Hopkins (Ph.D.) in 1896. Joining the United States Geological Survey in 1896, he was an assistant geologist until 1901, geologist in 1901-07, and thereafter director of the Survey. In 1909 he was president of the Washington Geological Society. Smith is author of reports on areal, economic, petrographic, and physiographic geology in the reports of the Survey.

**SMITH, GERARD FOWKE.** See FOWKE, GERARD.

**SMITH, GERRIT** (1797-1874). An American philanthropist, son of Peter Smith of Utica, N. Y., who, associated in the fur trade with John Jacob Astor, accumulated a fortune which the son greatly increased. Gerrit graduated from Hamilton College in 1818 and with some study of law entered upon that profession and practiced with distinction in both State and Federal courts. His home was in Peterboro, Madison Co., N. Y. Entering Congress in 1853, he found public life distasteful and abandoned it after the long session of 1854. At this time a very large landowner, Smith developed radical views in opposition to private land monopoly. Putting theory into practice, he began and for

years continued to distribute holdings to poor families—often to negroes—in parcels of 50 acres each. In religious matters he was a radical and attempted to build up an independent church both by money gifts and his own preaching. Plunging at length into the antislavery movement, he became by generosity and earnestness one of its most effective agitators. His private gifts are said to have amounted to \$8,000,000. A staunch and lifelong friend of John Brown, he supported him in his Kansas raids and through subsequent tribulations. The signing of Jefferson Davis's bail bond when the Civil War was over, by Gerrit Smith and Horace Greeley, was one of the most characteristic acts of each of those unusual men. Besides numerous speeches and pamphlets, chiefly on the slavery issue, Smith wrote *The Religion of Reason* (1864) and *Nature the Base of a Free Theology* (1867). Consult the biography by O. B. Frothingham (New York, 1878).

**SMITH, GERRIT** (1859-1912). An American organist and composer, born at Hagerstown, Md., and educated at Hobart College. After studying music abroad he was organist of St. Paul's Cathedral, Buffalo, of St. Peter's Church, Albany, N. Y., and, from 1885 until his death, of the Old South Church, New York, where he gave some 300 free organ recitals. He was also professor of music at Union Theological Seminary and professor of theory at the Master School, Brooklyn. For six years he served as president of the Manuscript Society of Composers, and he was honorary president of the American Guild of Organists. His compositions include a cantata (*King David*), a *Song Cycle*, more than 75 songs, and numerous piano pieces.

**SMITH, GOLDWIN** (1824-1910). A British American publicist, historian, and educator. He was born at Reading, Berkshire, England, Aug. 20, 1824, and was educated at Eton and at Oxford (Christ Church, Magdalen College, and University College, of which he was elected a fellow in 1847). He was called to the bar at Lincoln's Inn, but never practiced. His interest in university reform led to his appointment as assistant secretary to the first Oxford commission (1850) and as secretary to the second commission (1854). From 1858 to 1866 he was regius professor of modern history at Oxford. Even before the outbreak of the Civil War in the United States he had enthusiastically championed the North, and in 1864 he visited the United States and spoke and wrote strongly for the Union. From 1868 until 1871 he was professor of English and constitutional history at Cornell University, but in 1871 he went to Toronto, retaining a nonresident professorship at Cornell. In Canada he at once took the lead in literary activity and became prominent in educational circles. Politically he at first favored independence, but later he was convinced that the destiny of Canada was annexation to the United States, which, he said, "was written in the stars." After this was known, his name was for many years a storm centre in Canadian political life. Goldwin Smith was unsparingly denounced in the press and on the platform, but the compass and variety of his intellectual interests prevailed against a provincial criticism and dislike. His great services to Canadian journalism were widely acknowledged. He was the founder and editor successively of the *Canadian Monthly*, the *Nation*, the *Toronto Week*, and the *Bystander*, and later he

was the principal contributor to the *Sun*, a paper published in the farming interest. Although these periodicals, except the last, were comparatively short-lived, they were unequalled in Canada for their treatment of public questions. At the same time he contributed to the leading British and American reviews, besides writing many books and pamphlets remarkable for keen insight and a felicitous style which won for him an international reputation. His philosophy of history reserved the largest liberty for the individual, thus upholding a moral rather than a physical theory of historical evolution. He denounced American imperialism as a grave danger and was opposed to Irish home rule, government paternalism, woman suffrage, and the legal prohibition of the liquor traffic. In 1904 he was president of the American Historical Association. His regard for Cornell, whose hall of humanities is named for him, was shown by the bequest of most of his property, amounting to about \$650,000, to that university. He married Mrs. W. H. Boulton (née Dixon), widow of a Conservative member of Parliament. He died at his residence, The Grange, Toronto, on June 7, 1910. His writings include: *The Empire* (1863); *Speeches and Letters* (1865), dealing with the American Civil War; *Lectures on Modern History* (1866), delivered at Oxford; *Three English Statesmen* (1867); *Lectures and Essays* (1882); *False Hopes* (1883); *Cowper* (1887), in the "English Men of Letters Series"; *Canada and the Canadian Question* (1891); *Essays on the Questions of the Day* (1894); *Guesses at the Riddle of Existence* (1897); *The United States: An Outline of Political History* (1899); *The United Kingdom: A Political History* (1899); *Irish History and the Irish Question* (1904); *My Memory of Gladstone* (1905); *In Quest of Light* (1906); *No Refuge but in Truth* (1909). Consult his *Reminiscences* (1910), edited by his private secretary, T. A. Haultain; also the latter's *Goldwin Smith: His Life and Opinions* (London, 1913).

**SMITH, GREEN CLAY** (1832-95). An American soldier, legislator, and preacher, born at Richmond, Ky. He served through the Mexican War as lieutenant in a Kentucky regiment, graduated at Transylvania University in 1850 and at the Lexington Law School in 1853, and settled in Covington at law practice in 1858. In 1860 he was elected to the Kentucky Legislature, where on the approach of Civil War he tried to keep the State in the Union. On the outbreak of hostilities he became colonel of the Fourth Kentucky Cavalry (Federal), took part in the Tennessee campaigns of 1862, and in that year was commissioned brigadier general of volunteers. In 1863, having been elected a Unionist member of the Thirty-eighth Congress, he resigned his commission. He was reelected to Congress in 1864 and in 1866 was appointed by President Johnson Governor of Montana Territory. He retired from politics in 1869, was ordained to the Baptist ministry, and attained prominence as an evangelist. In 1876 he was presidential candidate of the Prohibition party.

**SMITH, GUSTAVUS WOODSON** (1822-96). An American soldier, born in Scott Co., Ky. He graduated at the United States Military Academy in 1842, fought in the Mexican War, and was brevetted lieutenant for gallantry at Cerro Gordo and captain for services at Contreras. In 1861 he was commissioned major general in the Confederate service. After Gen. Joseph E.

Johnston was wounded in the battle of Seven Pines, Smith was for a short time in command of the Army of Northern Virginia, but was seized by a temporary attack of paralysis and was superseded by General Lee. Afterward he was in command of Richmond and then of the Georgia militia. He published *Confederate War Papers* (1883; 2d ed., 1884) and *Battle of Seven Pines* (1891).

**SMITH, HANNAH WHITTALL** (1832-1911). An American religious and feminist leader, born in Philadelphia. A Quaker herself, she was educated at the famous Quaker school of Miss Mary Anna Longstroth and in 1851 was married to Robert Pearsall Smith. For many years she conducted Bible classes for women in Philadelphia, and her home was a centre of religious life there. In 1873-74 Mr. and Mrs. Smith held a series of religious conferences in various cities of England, and after 1888 they made their home in London. Mrs. Smith was president of the British organization of the Woman's Christian Temperance Union and was also closely connected with the English woman-suffrage movement. She wrote many religious tracts, and the *Unselfishness of God*, *The God of All Comfort*, and *The Christian's Secret of a Happy Life* (1877).

**SMITH, SIR HENRY BABINGTON** (1863-1923). A British financier. He was born at Jordan Hill, Renfrewshire, Scotland, and was educated at Eton and at Trinity College, Cambridge. In 1894-99 he was private secretary to the Earl of Elgin, Viceroy of India, whose daughter he married in 1898. He was British representative abroad at various postal, telegraph, and other congresses and conferences of importance. Smith became president of the National Bank of Turkey in 1909. In 1915 he was a member of the Anglo-French Commission which came to New York City and in October negotiated a loan of \$500,000,000 for the allies in the European War. He was knighted in 1908 (K.C.B.).

**SMITH, HENRY BOYNTON** (1815-77). An American educator and theologian. He was born at Portland, Me., graduated at Bowdoin College in 1834, and studied theology at Andover and abroad at Paris, Halle, and Berlin. For several years he was a Congregational minister. Subsequently he was professor of philosophy in Amherst College (1847-50), and then for 24 years was at Union Theological Seminary, holding the chair of Church history and then that of systematic theology. He belonged to the liberal and progressive school in theology and was prominent in the work of Presbyterian union. He edited the *New York Evangelist* and was coeditor of the *American Theological Review*, the *American Presbyterian and Theological Review* and afterward of the *Presbyterian Quarterly* and *Princeton Review*. His writings, most of which appeared posthumously, include: *Tables of Church History* (1859); *Faith and Philosophy* (1877); *Lectures on Apologetics* (1882); *Introduction to Christian Theology* (1883); *System of Christian Theology* (1884).

**SMITH, HENRY HOLLINGSWORTH** (1815-90). An American surgeon, born in Philadelphia. He graduated from the medical department of the University of Pennsylvania in 1837, studied for two years in the hospitals of London, Paris, and Vienna, and was professor of surgery in the University of Pennsylvania from 1855 till his retirement in 1871. During the first two years of the Civil War (1861-62), as surgeon-

general of Pennsylvania, he organized the field hospital service thoroughly and introduced the practice of embalming on the field of battle. Among his published works are: *Minor Surgery* (1843; 3d ed., 1850); *System of Operative Surgery* (2 vols., 1852; 2d ed., 1855); *The Treatment of Disunited Fractures by Means of Artificial Limbs* (1855); *The Principles and Practice of Surgery* (2 vols., 1863).

**SMITH, HENRY JOHN STEPHEN** (1826-83). A British mathematician, born in Dublin, Ireland. He was educated at Balliol College, Oxford, of which he was elected fellow. He won numerous prizes and was a brilliant scholar. In 1850 he was appointed lecturer in mathematics at Balliol College and in 1851 senior scholar in mathematics. In 1860 he became Savilian professor of geometry and in 1861 was elected fellow of the Royal Society and of the Royal Astronomical Society. Smith was the leading English writer on the theory of numbers and a disciple of Gauss, whose writings he thoroughly examined. These researches occupied his time from 1854 to 1864 and are contained in his *Report on the Theory of Numbers*, presented to the British Association in six parts (1859-65). His most important contributions were contained in two papers: "On Systems of Linear Indeterminate Equations and Congruences" and "On the Orders and Genera of Ternary Quadratic Forms" (1861, 1867). Jacobi had proved the cases of numbers as the sum of two, four, and six squares; Eisenstein had proved the case of three squares but left that of five squares without demonstration. The formulae for this were supplied by Smith (as also for that of seven squares), but through an oversight the French Academy set this as the subject of their "Grand prix de sciences mathématiques" for 1862. The prize of 3000 francs was awarded him two months after his death. Smith also devoted his attention to elliptic functions, his results being published in the *Proceedings* of the London Mathematical Society. Smith's published writings were collected and edited by Glaisher in two volumes (Oxford, 1894). Consult *Monthly Notices of the Royal Astronomical Society*, vol. xlv (London, 1884), and the *Fortnightly Review* (ib., May, 1883).

**SMITH, HENRY PRESERVED** (1847-1927). An American theologian and Orientalist, brother of Richmond Mayo-Smith (q.v.). He was born in Troy, Ohio, and was educated at Amherst (A.B., 1869), at Lane Theological Seminary, and in Berlin. He was appointed professor at Lane Seminary in 1877. In 1891, after the Briggs heresy case (see BRIGGS, C. A.), Professor Smith in an address on *Biblical Scholarship and Inspiration* urged a distinction between inerrancy and inspiration, and, for his attack on the former doctrine, citing parallel accounts in Chronicles and in Samuel and Kings, he was tried by the Presbytery of Cincinnati in 1892 and suspended. (Consult his *Inspiration and Inerrancy*, 1893.) Subsequently he entered the ministry of the Congregational church and served in succession as professor at Andover Seminary in 1893-98, at Amherst College from 1898 to 1906, and Meadville (Pa.) Theological School (Unitarian) in 1907-13, and as chief librarian of Union Seminary, New York. He published: *The Bible and Islam* (1897); *A Commentary on Samuel* (1899); *Old Testament History* (1903); *The Religion of Israel* (1914).

**SMITH, HOKE** (1855- ). An American lawyer and statesman, born at Newton, N. C. He was educated at Chapel Hill in a school of his father's, and on removal to Georgia he studied law. Practicing in Atlanta, he became one of the most successful lawyers in the State. From 1887 to 1898 he was president and publisher of the *Atlanta Journal*, which became a power in Georgia politics. In recognition of his able support of Cleveland, Smith was made Secretary of the Interior in Cleveland's second cabinet and he served acceptably for three years (1893-96). In 1896 he supported Bryan for President. Although active in Democratic politics, he subsequently devoted himself to his law practice until 1906, when he was elected Governor of Georgia on a reform ticket. Defeated for reelection in 1910 he was chosen Governor again by an overwhelming majority. (See *GEORGIA, History*.) Smith was elected United States Senator in 1911 to fill an unexpired term and in 1914 was reelected. He was a supporter of President Wilson. In 1915 he criticized bitterly the English blockade system.

**SMITH, HORACE**. See SMITH, JAMES AND HORATIO.

**SMITH, JACOB HURD** (1840-1918). An American soldier. He was born at Jackson, Ohio, and graduated at the Collegiate and Commercial Institute, New Haven, in 1858. He fought in the Civil War (rising to be captain), in the frontier Indian Wars, and in the Spanish-American War. He was made brigadier general of volunteers in 1900 and in 1901 brigadier general in the regular army. In the autumn of 1901, while commander of the Sixth Separate Brigade in Samar, Philippine Islands, Smith gave heated oral orders for severe treatment of belligerent natives. He was afterward tried by a court-martial convened in the Philippines under an order of President Roosevelt dated April 21, 1902. It was decided that Smith's instructions were prejudicial to good order and discipline, but in view of his previous good record and of the circumstances of the case he was given the light sentence of being retired from active service. His sentence was further mitigated by the fact that in 1902 he had reached the age limit.

**SMITH, JAMES** (c.1720-1806). An American legislator, one of the signers of the Declaration of Independence, born in Ireland. He came to America with his father, who settled on the Susquehanna in Pennsylvania in 1729. He was educated at the College of Philadelphia and studied law. He was a delegate to the Provincial Conference to discuss the state of the Colonies in July, 1774, raised a volunteer company, and wrote an *Essay on the Constitutional Power of Great Britain over the Colonies in America*. He was a delegate to the Pennsylvania Convention in January, 1775, to the Provincial Conference in June and to the State Constitutional Convention in July. From 1775 to 1778 he served in the Continental Congress and during this time signed the Declaration of Independence. In 1779 he was a member of the Pennsylvania General Assembly and in 1784 was elected to Congress for one term.

**SMITH, JAMES** (1737-1812). An American backwoodsman, born in Franklin Co., Pa. He was captured by the Indians in 1755 and was adopted into the Caughnewaga nation, but escaped in 1759. He was the leader (1763) of the Black Boys, organized to fight the Indians,

served as lieutenant in Bouquet's expedition of 1764 (see *BOUQUET, HENRY*), and in 1766-67, with four companions, explored the southern part of Kentucky. In 1769, at the head of 18 men, he captured Fort Bedford and released several prisoners there, this being the first fort ever taken from British troops by American colonists. He served as captain of rangers in Lord Dunmore's War and sat in the Pennsylvania Assembly in 1776-77 and in the latter year was commissioned colonel. He published *An Account of the Remarkable Occurrences in the Life and Travels of Col. James Smith* (1799) and *A Treatise on the Mode and Manner of Indian War* (1811).

**SMITH, JAMES** (1775-1839) and **HORATIO** (generally known as Horace) (1779-1840). Authors of the *Rejected Addresses* and sons of a London solicitor. Both were educated at a school at Chigwell. James succeeded his father as solicitor to the Board of Ordnance; Horace adopted the profession of stockbroker and made a handsome fortune, on which he retired with his family to Brighton. Both were popular and accomplished men—James remarkable for his conversational powers and gaiety, and Horace distinguished for liberality and benevolence. The work by which they are best known is a small volume of verse parodies, perhaps the most felicitous in the language. On the opening of the new Drury Lane Theatre in October, 1812, the committee of management advertised for an address to be spoken on the occasion, and the brothers adopted a suggestion made to them that they should write a series of supposed "Rejected Addresses." They accomplished their task in six weeks—James furnishing imitations of Wordsworth, Southey, Coleridge, Crabbe, Cobbett, etc., and Horace those of Scott, Byron (all but the first stanza), Monk Lewis, Moore, and others. Horace Smith also wrote several historical novels in imitation of Scott. The best is *Brambletye House* (1826), dealing with the Commonwealth and the Restoration. Horace's *Poetical Works* appeared in 1846. Consult *Rejected Addresses* (ed. by Percy Fitzgerald, London, 1890).

**SMITH, JESSIE WILLCOX** (?- ). An American illustrator and painter. She was born in Philadelphia and studied there at the Pennsylvania Academy of Fine Arts, also under Howard Pyle at the Drexel Institute, and after 1890 was known for her illustrations in current magazines. Her child subjects, of which she made a specialty, became very popular and display genuine love for and insight into child nature. Well-known series are: "The Child's World," "The Five Senses," "Seven Ages of Childhood" (1909), and illustrations for Mother Goose Rhymes. She made her home in Philadelphia. She received a silver medal at the Panama-Pacific Exposition (1915).

**SMITH, JOHN** (c.1570-1612). See *SMYTH, JOHN*.

**SMITH, JOHN** (1580-1631). A famous adventurer, explorer, and colonist, born at Willoughby, Lincolnshire, England. He was left an orphan at an early age. At 15 he accompanied the sons of an English nobleman on a tour of the Continent as a page, but left them and enlisted with the Protestants of France. He was a soldier of fortune in different lands and met with a series of romantic adventures. Upon his return to England, in 1605, he was induced to take part in the colonization of

Virginia and sailed thence in 1606. He was named a member of the Council for the community in the secret list prepared before departure, but during the voyage he was imprisoned on a charge of sedition. On arrival, when the sealed instructions were opened, he was not allowed to take his seat.

Smith went out on expeditions for forage and discovery among the Indians and conducted them ably. After the first trip of discovery he was, in June, 1607, admitted to the Council. On one of these occasions, in December, 1607, he was captured by the Indian chief Powhatan (q.v.). The story which he relates of the young Indian maiden Pocahontas, the daughter of Powhatan, who, when he was condemned to death by the savage chieftain, saved his life by her interposition, is not now fully credited. (See *POCAHONTAS*.) After a period of turbulence and disaster Smith's influence became paramount in Jamestown. During another of his journeys, in 1608, he explored Chesapeake Bay as far as the Patapsco. He was elected President of the Council in September, 1608, but the statement so often made that he saved the colony from ruin rests upon no adequate foundation. (See *DALE, SIR THOMAS*.) In his dealings with the Indians he showed himself astute and valiant, and an adept in Indian peculiarities. His services were not sufficiently appreciated, and upon the grant of a new charter and the reorganization of the government he returned to England at the close of 1609. He was sent out on voyages of discovery and in 1614 made a fairly complete exploration of the New England coast from the Penobscot to Cape Cod. To the same end he twice sailed in 1615, the first time being driven back by bad weather and the second time being captured by the French. He died in 1631.

His two really historical works are his *True Relation*, published in 1608 (the best edition being that edited by Charles Deane, Boston, 1867), and his *General Historie of Virginia, New England, and the Summer Isles*, published in 1624. Three other works of importance are his maps of Virginia (1612), his *Description of New England* (1616), and his *New England's Trials* (1620). The only comprehensive edition of Smith's Works is that by E. Arber (Birmingham, 1884; London, 1895). Consult: C. D. Warner, *Life of Captain John Smith* (New York, 1881); John Ashton, *Adventures and Discoveries of Captain John Smith* (ib., 1883); Tudor Jenks, *Captain John Smith* (ib., 1904); A. G. Bradley, *Captain John Smith* (ib., 1905); note on Capt. John Smith in Edward Channing, *History of the United States*, vol. i (ib., 1907); T. J. Wertenbaker, *Virginia under the Stuarts* (Princeton, 1914); E. B. Smith, *Pocahontas and Captain John Smith* (Boston, 1914).

**SMITH, JOHN** (1618-52). One of the founders of the Cambridge Platonists. See *CAMBRIDGE PLATONISTS*.

**SMITH, JOHN BERNHARDT** (1858-1912). An American entomologist, born in New York. He studied law and was admitted to the bar in 1879, but was more interested in entomology and in 1884 became a special agent of the United States Department of Agriculture. He was assistant curator of the United States National Museum in 1886 and after 1889 professor at Rutgers College and entomologist of the New Jersey Agricultural College Experiment Station. He was in charge of the New Jersey campaign

against mosquitoes and was best known for this work and that against the San José scale. His writings include *Economic Entomology for Farmer and Fruit Grower* (1896) and *Our Insect Friends and Enemies* (1909).

**SMITH, JOHN LAWRENCE** (1818-83). An American chemist. He was born in Louisville, Ky., and was educated at the University of Virginia, the Medical College of South Carolina (M.D., 1840), in Germany under Liebig, and in Paris under Pelouze. In 1844 he began the practice of medicine in Charleston and established the *Medical and Surgical Journal of South Carolina*. During 1846-50 he investigated the mineral resources of Turkey, for the government of that country, and he discovered deposits of coal, chrome ore, and the famous emery deposits of Naxos. From 1852 to 1854 he was professor of chemistry in the University of Virginia. He was president of the American Association for the Advancement of Science (1872) and of the American Chemical Society (1877). His collection of meteorites was the finest in the United States and on his death passed to Harvard. He published *Mineralogy and Chemistry, Original Researches* (1873; enlarged with biographical sketches, 1884).

**SMITH, JOHN RAPHAEL** (1752-1812). An English mezzotint engraver and painter. He was born in Derby, the son of Thomas Smith, a landscape painter. Without regular instruction he started to paint miniatures and then to engrave in stipple and mezzotint, in which medium he became the most conspicuous master of his time, being especially noted for originality and brilliancy of technique. He excelled in interpreting Reynolds, Romney, and Morland. Smith was appointed engraver to the Prince of Wales and was also engaged as a print dealer and publisher. At the close of his life he confined himself to drawing portraits in chalk. Consult *John Raphael Smith*, in "Great Engravers" (London, 1911).

**SMITH, JOHN WALTER** (1845-1925). An American legislator, born at Snow Hill, Md. He was engaged in the lumber business from 1865 and was president of the Snow Hill Bank from its organization. As a staunch Democrat he was a member of the Maryland Senate (1889-99), receiving the minority vote for United States Senator in 1896. Elected a Representative in Congress in 1898, he resigned in 1900 to become Governor of Maryland, serving until 1904. He was generally regarded as an able politician of conservative tendencies. In 1908 he was elected to fill the unexpired term of W. P. Whyte (q.v.), later in the same year was elected for a full term, and in 1914 was re-elected.

**SMITH, JOSEPH, JR.** (1805-44). The founder of Mormonism. He was born at Sharon, Vt., Dec. 23, 1805, but as a child moved with his parents to western New York, and settled near Manchester. It was there that in 1820 and 1823 he experienced the visions which called him to be the leader of a new religious sect. The *Book of Mormon* (see MORMON, BOOK OF) was published in 1830, and in the same year the Mormon church was organized. The new faith spread rapidly, and Joseph Smith established headquarters at Kirtland, Ohio, in 1831. Subsequently the church built a temple at Independence, Mo., and when forced to leave in 1838 they founded Nauvoo, Ill. Here also their doctrines aroused much hostility, reaching a climax on

June 27, 1844, when Joseph Smith was murdered by a mob at Carthage, Ill. For a detailed account of Smith's life see MORMONS. See also SMITH, JOSEPH (1832-1914), and SMITH, JOSEPH FIELDING.

**SMITH, JOSEPH** (1832-1914). An American Mormon leader, son of Joseph Smith (q.v.), founder of the Mormon church. He was born at Kirtland, Ohio, and received a common-school education at the Mormon settlement of Nauvoo, Ill., but he did not join his fellow religionists in their migration to Utah. He opposed the practice of polygamy, and always denied that his father was a polygamist or ever sanctioned polygamy. He became a leader among the Mormons of the Middle West and in 1860 was chosen president of the Reorganized Church of Jesus Christ of Latter-Day Saints (q.v.). In 1863 he became editor of the Mormon paper, the *Saints' Herald*.

**SMITH, JOSEPH FIELDING** (1838-1918). An American Mormon leader, nephew of Joseph Smith, the Mormon prophet. He was born at Far West, Mo., and in 1848 drove an ox team in the exodus of the Mormons to Salt Lake valley. In 1858 he was ordained a high priest and a member of the high council and spent several years as a missionary to the Sandwich Islands and to Great Britain. Ordained an apostle in 1866, he became a member of the council of twelve in the following year, from 1880 to 1901 was second counselor in the first presidency of the church, and thenceforth was its president. He was several times a member of the Utah Legislature and in 1882 presided over the Constitutional Convention that framed a constitution for the State of Utah and petitioned Congress for admission to the Union. He wrote *Origin of the "Reorganized" Church* (1909).

**SMITH, JOSHUA TOULMIN** (1816-1869) (known in letters as Toulmin Smith). An English lawyer and author. In 1837 he came to the United States, settling in Detroit, then in Utica, later in Boston, where he lectured. His studies of the Icelandic sagas resulted in *The Northmen in New England, or America in the Tenth Century* (1839), said to be the earliest account in English of the voyages of the Norsemen to Vineland. He returned to England in 1842. At the time of his death he was at work on a history of *English Gilds*, which was edited in 1870 by his daughter for the Early English Text Society. He wrote on and worked for sanitary and municipal reform and also on geological and antiquarian subjects.

**SMITH, JUDSON** (1837-1906). An American educator, born at Middlefield, Mass. He graduated at Amherst in 1859 and at Oberlin Theological Seminary in 1863 and was ordained a Congregational minister in 1866. He was professor of Latin in Oberlin in 1866-70, of ecclesiastical history in the Oberlin Theological Seminary in 1870-84, and lecturer on modern history there in 1875-84. In 1884 he became corresponding secretary of the American Board of Commissioners for Foreign Missions. He visited the board's missions in Turkey in 1888 and those in China in 1898. In 1882-84 he was editor of the *Bibliotheca Sacra* and was its associate editor after that time. He published *Lectures in Church History and the History of Doctrine from the Beginning of the Christian Era till 1864* (1881) and *Lectures on Modern History* (1881).

**SMITH, MARCUS AURELIUS** (1852-1924). An American lawyer and legislator, born near Cynthiana, Ky. He was educated at Transylvania University, from which he graduated in law. In 1881 he moved to Arizona, where he practiced law and entered politics as a Democrat. While Arizona was a Territory he served during several periods as delegate to Congress, and when it became a State he was elected United States Senator (1912), having been chosen in the primary election. He was re-elected in 1914. In Congress he was deeply interested in the solution of irrigation problems and in the reclamation service.

**SMITH, MELANCTON** (1810-93). An American naval officer, born in New York City. He was appointed midshipman in the navy in 1826 and in 1839 on board the *Poinsett* coöperated with land forces against the Seminoles in Florida. He became a commander in 1855 and in 1861-62 commanded the *Massachusetts* in the Gulf blockading squadron. Smith became captain in 1862. He commanded the naval forces in the capture of Biloxi, Miss., and after running by the Confederate forts took part in the capture of New Orleans. He attacked and destroyed the Confederate ram *Manassas*, but in the attack on Vicksburg his vessel ran aground while attempting to pass the Confederate batteries and was abandoned. In the battle of Mobile Bay he distinguished himself in command of the *Monongahela* and in both attacks on Fort Fisher commanded the *Wabash*. He became a commodore in 1866, a rear admiral in 1870, and retired in 1871.

**SMITH, MORGAN LEWIS** (1822-74). An American soldier, born in Oswego Co., N. Y. In 1846 he joined the United States army as a private, but later engaged in business. Upon the outbreak of the Civil War he organized the Eighth Missouri Volunteer Regiment and was chosen its colonel in 1861. He commanded a brigade at the capture of Fort Donelson and in the battle of Shiloh was promoted to brigadier general in 1862 and commanded a division in the Vicksburg and Chattanooga campaigns under Sherman. In 1864 he succeeded to the command of the Fifteenth Army Corps. After the war he was for a time United States Consul at Honolulu.

**SMITH, (EDMUND) MUNROE** (1854-1926). An American jurist and historian, born in Brooklyn. He graduated at Amherst in 1874 and at Columbia Law School in 1877 and in 1880 received the degree of J.U.D. at Göttingen. Instructor in Columbia from 1880 to 1883 and adjunct professor of history until 1891, he was then appointed professor of Roman law and comparative jurisprudence. He was managing editor of the *Political Science Quarterly* in 1886-93 and 1904-13, wrote articles on Roman law and cognate subjects for the *NEW INTERNATIONAL ENCYCLOPÆDIA*, and contributed to Johnson's *Universal Encyclopedia*, to Harper's *Classical Dictionary*, to Lalor's *Cyclopedia of Political Science*, and to the *Law Quarterly Review* and other periodicals. His works include: *Bismarck and German Unity* (1898; 2d ed., 1910); "Orations and Essays of Cicero," in *The World's Great Books* (1900); *Military Strategy versus Diplomacy in Bismarck's Time and afterwards* (1915).

**SMITH, NATHAN** (1762-1829). An American physician. He was born in Rehoboth, Mass., and served in the Vermont militia during the last 18 months of the Revolutionary War. He

studied medicine at Harvard and Edinburgh. In 1798 he became professor of medicine at Dartmouth College, and later he held the chair of anatomy and surgery there. In 1813 he was elected professor of surgery and physics at Yale. His name is connected with the amputation of the thigh, for which he developed a new method, and with the introduction of the method of trephining of the bone in necrosis. He published *A Practical Essay on Typhous Fever* (1824).

**SMITH, NATHAN RYNO** (1797-1877). An American surgeon, son of Nathan Smith (q.v.). Born in Concord, N. H., he was educated at Yale (M.D., 1822). He was professor variously of surgery, anatomy, or medicine at the University of Vermont, Jefferson Medical College, Philadelphia, the University of Maryland, Transylvania University at Lexington, Ky. (1828-40), and again at the University of Maryland (1840-70). Smith invented an instrument for lithotomy and published *A Physiological Essay on Digestion* (1825); *Surgical Anatomy of the Arteries* (1832; 2d ed., 1835); *Treatment of Fractures of the Lower Extremities* (1867). He also edited his father's *Medical and Surgical Memoirs* (1831) and wrote *Legends of the South*, under the nom de plume "Viator." His son, ALAN PENNIMAN SMITH (1840-98), was born in Baltimore and in 1861 graduated M.D. from the University of Maryland, where he became professor of surgery in 1875.

**SMITH, PERCEY FRANKLYN** (1867- ). An American mathematician, born at Nyack, N. Y. He was educated at Yale (Ph.B., 1888; Ph.D., 1891) and studied also at the universities of Göttingen, Berlin, and Paris in 1894-96. After 12 years of teaching at the Sheffield Scientific School (Yale), he was appointed professor of mathematics there in 1900. Besides editing the *Transactions of the American Mathematical Society*, and *Elements of Differential Calculus* (1904), with W. A. Granville, his publications include: *Elementary Calculus* (1902); *Four-Place Logarithmic Tables* (1902); *Elements of Analytic Geometry* (1905), with A. S. Gale; *Introduction to Analytic Geometry* (1905), with Gale; *Theoretical Mechanics* (1910), with W. R. Longley; *Elementary Analysis* (1910), with Granville; *New Analytic Geometry* (1912), with Gale.

**SMITH, PERSIFOR FRAZER** (1798-1858). An American soldier, born in Philadelphia, Pa. He graduated at the College of New Jersey (Princeton) in 1815. As colonel of Louisiana Volunteers he served against the Seminole Indians (1836 and 1838). He was brigadier general of Louisiana volunteers at the outbreak of the Mexican War, but entered the regular service of the United States as colonel of mounted rifles in 1846. He was brevetted brigadier general for gallantry at Monterey and major general for his conduct at Contreras and Churubusco. He helped arrange an armistice with Mexico in August, 1847, and was placed in charge of the Second Division of the army. In 1847 he was military and civil Governor of Mexico and in 1848 held the same position at Vera Cruz. He remained in the army, became brigadier general (Dec. 30, 1856), and was sent to Kansas to quiet disturbances there.

**SMITH, RICHARD SOMERS** (1813-77). An American soldier and educator, born in Philadelphia, Pa. He graduated at West Point in 1834. He resigned his commission in 1836 and for four

years was engaged in engineering work. He was reappointed to the army in 1840 and in 1840-55 was stationed at West Point, first as instructor and after 1852 as professor of drawing, but again resigned in 1855 and was professor of mathematics at the Brooklyn Polytechnic Institute until 1859 and director of the Cooper Institute in 1859-61. In the latter year he was commissioned major in the regular army (Twelfth Infantry), was engaged as a recruiting officer in Maryland and Wisconsin, commanded his regiment in the operations of the Army of the Potomac in 1862 and a brigade in the early months of 1863, until after the battle of Chancellorsville. He resigned from the army on May 30, 1863, to become president of Girard College, where he remained until 1868. In 1868-70 he was professor of engineering at Pennsylvania State College and in 1870-77 was professor of drawing at the United States Naval Academy. He published *A Manual of Topographical Drawing* (1853; 3d ed., 1894) and *A Manual of Linear Perspective* (1857).

**SMITH, RICHMOND MAYO.** An American economist. See MAYO-SMITH, RICHMOND.

**SMITH, ROBERT** (1689-1768). An English mathematician and astronomer, born at Lea, near Gainsborough. He was educated at Trinity College, Cambridge. In 1716 he was elected to succeed Cotes as Plumian professor of astronomy at Cambridge, a position which he held till 1760. Besides astronomy he also lectured on optics and hydrostatics and was a defender of Newton's method of fluxions. He also effected the completion of the observatory over the great gate at Trinity College. In 1742 he became master of Trinity College and also acted as vice chancellor of the university (1742-43). He wrote: *A Compleat System of Opticks* (2 vols., 1728; student's ed., 1778); *Harmonics, or the Philosophy of Musical Sounds* (1744; 2d ed., 1759, and postscript, 1762).

**SMITH, (WILLIAM) ROBERTSON** (1846-94). A Scottish biblical critic and Arabic scholar. He was born Nov. 8, 1846, at Keig, Aberdeenshire. He graduated at Aberdeen University in 1865. He studied theology at New College, Edinburgh, and spent two summers in Germany, at Bonn and Göttingen, where he heard the lectures and made the acquaintance of Bertheau, Lotze, and Ritschl, by whom he was particularly influenced. In 1870 he became professor of Oriental languages and exegesis of the Old Testament in the Free Church College, Aberdeen. During the summer of 1872 he was again in Germany, studied Arabic with Lagarde, and became acquainted with Fleischer, Wellhausen, and other prominent Orientalists. In 1875 he became a member of the Old Testament revision committee. His articles "Angels" and "Bible," written for the ninth edition of the *Encyclopædia Britannica*, aroused suspicion and hostility in the church. A committee was appointed by the General Assembly in 1876 to investigate, and eventually (1881) Professor Smith was dismissed from his chair. The case is a famous one; its practical outcome was to popularize his scholarly methods and views. While his case was pending he spent two winters in the East, visiting Egypt, Palestine, Syria, and Arabia. From his dismissal till 1888 he was associated with Professor Baynes as editor of the *Britannica*. At the same time he continued his Semitic studies with most valuable results. In 1883 he became Lord Almoner's professor of

Arabic at Cambridge, in 1886 chief librarian of the university, and in 1889 Adams professor of Arabic. He died at Cambridge, March 31, 1894.

Besides numerous papers, he published: *What History Teaches us to Look for in the Bible* (1870); *The Old Testament in the Jewish Church* (1881; 2d ed., 1892); *The Prophets of Israel* (1882; 2d ed., 1895); *Kinship and Marriage in Early Arabia* (1885); *Lectures on the Religion of the Semites: Fundamental Institutions* (1889; 3d ed., 1907), the first of three series of lectures at Aberdeen. Consult Bryce, *Studies in Contemporary Biography* (New York, 1903).

**SMITH, SAMUEL** (1752-1839). An American soldier, born at Lancaster, Pa. He became a captain in Smallwood's Maryland Regiment in January, 1776, and served at the battles of Long Island and White Plains, attaining the rank of lieutenant colonel in 1777. He was in the attack on Staten Island and the battle of Brandywine and commanded at Fort Mifflin (q.v.), repelling the attacks of the English, though finally badly wounded. He was a member of the Maryland House of Delegates in 1792, was a member of Congress (1793-1803 and 1816-22), for a time in 1801 Secretary of the Navy, United States Senator (1803-15 and 1822-33). He commanded the State troops as major general of militia in the defense of Baltimore in 1814 and was mayor of Baltimore in 1835-38.

**SMITH, SAMUEL FRANCIS** (1808-95). An American clergyman and hymn writer. He was born in Boston, graduated at Harvard in 1829, and at Andover Seminary in 1832. He was professor of modern languages in Waterville (later Colby) College (1834-42), editor of the *Christian Review*, Boston (1842-48), and editor of the Publications of the American Baptist Missionary Union (1854-69). He wrote "My Country, 'Tis of Thee" (first sung in the Park Street Church, Boston, July 4, 1832) and other favorite hymns. His publications include lives of Rev. Joseph Grafton (1848) and William Hague (1889); *Missionary Sketches* (1879; 2d ed., 1883); *History of Newton, Mass.* (1880); *Rambles in Mission Fields* (1884). A collected edition of his poems appeared at New York in 1895.

**SMITH, SAMUEL STANHOPE** (1750-1819). An American clergyman and educator. He was born at Pequea, Pa., graduated at the College of New Jersey (Princeton) in 1769, and was ordained a Presbyterian minister. He served as first president of Hampden-Sidney College (1775-79), and returned to his alma mater to be successively professor of moral philosophy, professor of theology, vice president, and president (1795-1812). Among his publications are: *Lectures on the Evidences of the Christian Religion* (1809); *Lectures on Moral and Political Philosophy* (1812); *Comprehensive Views of Natural and Revealed Religion* (1815). Consult the memoir prefixed to his *Sermons* (Philadelphia, 1821).

**SMITH, SEBA** (1792-1868). An American humorist, born at Buckfield, Me. After graduating at Bowdoin in 1818, he became a journalist in Portland, Me., editing three papers, the last of which was the *Daily Courier*, to which he contributed, beginning in 1830, the humorous letters on local and national politics which purported to be written by "Major Jack

Downing." These letters are not to be confounded with the amusing letters of a second "Major Downing" published in 1834 by Charles Augustus Davis (1795-1867) of New York City. Among his works may be named: *Deudrops of the Nineteenth Century* (1846); *Powhatan: A Metrical Romance* (1841); and *Way Down East, or Portraits of Yankee Life* (1855); *My Thirty Years out of the Senate* (1859).

His wife, ELIZABETH OAKES (PRINCE) SMITH (1806-93), aided her husband, and was an early lecturer on woman's suffrage and other subjects and published, among other books, *Woman and her Needs* (1851).

SMITH, SIR (WILLIAM) SIDNEY (1764-1840). An English admiral, born at Westminster, London. In 1790-92 he aided the King of Sweden in the war with Russia and was knighted by Gustavus III for his services. In 1798 he was made plenipotentiary to Constantinople and in 1799, from March till May, made the famous defense of St. Jean d'Acre against Bonaparte, which earned for him a permanent place among English naval commanders and drew from Parliament a vote of thanks and an annuity of £1000. His customary vanity was rendered unobtainable by these tokens of enthusiasm, and, usurping the prerogatives of commander in chief, he concluded the untenable Treaty of El Arish (Jan. 24, 1800), which caused a renewal of the war. He was made an admiral in 1821 and created G.C.B. in 1838. Consult Barrow, *Life of Sir W. S. Smith* (1848), and A. T. Mahan, *Influence of Sea Power upon the French Revolution and Empire* (Boston, 1892).

SMITH, SIDNEY IRVING (1843- ). An American biologist, born at Norwag, Me. In 1867 he graduated from the Sheffield Scientific School (Yale), where he was professor of comparative anatomy from 1875 to 1906. He had charge of deep-water dredging in Lake Superior for the United States Lake Survey in 1871 and of similar work about St. George's Banks for the United States Coast Survey in 1872. In 1871-87 he was connected with the work of the United States Fish Commission. He was elected a member of the National Academy of Sciences in 1884. Professor Smith became known for his papers on American marine invertebrate zoölogy, particularly on crustaceans and their postembryonal stages.

SMITH, SOPHIA (1796-1870). An American philanthropist, born in Hatfield, Mass. She founded Smith Academy in her native town and gave liberally to Andover Theological Seminary and to foreign missions. The bulk of her estate, however, amounting in all to about \$450,000, she left for the establishment at Northampton, Mass., of Smith College (q.v.) for women.

SMITH, SYDNEY (1771-1845). An English humorist, born at Woodford in Essex and educated at Winchester and at New College, Oxford. From 1798 to 1803 he lived in Edinburgh. In 1800 he published *Six Sermons*. In 1802 he joined Jeffrey, Horner, and Brougham in founding the *Edinburgh Review*, the first three numbers of which he mainly edited. To this periodical he contributed during the next 25 years about 80 articles of various kinds. In 1803 he gave up tutoring, which he had hitherto combined with preaching, and settled in London, where he gained fame as preacher, lecturer, and humorist. In 1828 Lord Lyndhurst, the Chancellor, presented him to a prebend in Bristol Cathedral and the next year enabled him to ex-

change Foston for Combe-Florey, a more desirable rectory in Somersetshire. In 1831 Earl Grey appointed him one of the canons residentiary of St. Paul's. In 1839 he inherited from his brother £50,000 and took a house in Grosvenor Square, London.

Smith's writings comprise the famous *Letters on the Subject of the Catholics, to my Brother Abraham, who Lives in the Country*, by Peter Plymley (anonymous, 1807-08), written to promote the cause of Catholic emancipation and abounding in wit and irony worthy of Swift; *Three Letters to Archdeacon Singleton on the Ecclesiastical Commission* (1837-39); *Letters on American Debts* (1843). His *Works* (1839-40) appeared in four volumes. Though the writings of Smith relate mostly to temporary controversies, they yet hold a place in our literature as specimens of clear and vigorous reasoning, rich humor, and solid good sense. His jokes, exaggeration, and ridicule are all logical, driving home his arguments; and his wit is sportive, untinctured with malice.

Bibliography. His *Works* (3 vols., London, 1839; Philadelphia, 1844; Boston, 1856), with many later issues of selections, etc.; *Wit and Wisdom of S. Smith*, with memoir, by Duyckinck (New York, 1856; often reprinted); Lady Holland, *Memoir of Rev. Sydney Smith, with a Selection from his Letters* (new ed., 2 vols., London, 1869); G. E. B. Saintsbury, *Essays in English Literature, First Series* (ib., 1891); André Chevrillon, *Sydney Smith et la renaissance des idées libérales en Angleterre au XIX<sup>e</sup> siècle* (Paris, 1894); S. J. Reid, *Sketch of the Life and Times of Sydney Smith* (4th ed., London, 1896); G. W. E. Russell, *Sydney Smith*, in "English Men of Letters Series" (New York, 1905).

SMITH, THEOBALD (1859- ). An American biologist and pathologist, born at Albany, N. Y., and educated at Cornell and at the Albany Medical College (M.D., 1883). In 1884 he became director of the pathological laboratory of the Bureau of Animal Industry at Washington and two years later also professor of bacteriology at Columbian (now George Washington) University. In 1895 he went to Boston to be director of the pathological laboratory of the Massachusetts Board of Health, and he was also appointed, in the following year, professor of comparative pathology at Harvard. Smith, who became known as the leading scientist in the United States in the field of infectious diseases, made important observations and discoveries. He was the first to demonstrate the theory of immunization by practice when, in 1886, he showed that injection of the filtered virus of cholera in hogs produced immunity against the disease in man. In 1889 he found the organism of Texas fever in *Pyrosoma bigeminum*, which he and F. L. Kilborne demonstrated was transferred by the tick *Boophilus bovis*. In 1898 he declared that there existed a distinction between the human and bovine types of tubercle bacilli, a statement indorsed by Robert Koch in 1900. Smith was elected to the National Academy of Sciences in 1908. His contributions to medical journals, government bulletins, etc., appeared in reprint form.

SMITH, THEODORE CLARKE (1870- ). An American historical writer. He was born at Roxbury, Mass., and was educated at Harvard (A.B., 1892; Ph.D., 1896) and abroad at Paris and Berlin. He served as an assistant professor

at Ohio State University from 1901 to 1903 and thereafter was professor of American history at Williams College. He published: "Political Reconstruction," in *Cambridge Modern History*, vol. viii (1903); *Liberty and Free Soil Parties in the Northwest* (1898); *Parties and Slavery* (1906); *Wars between England and the United States* (1914).

**SMITH, SIR THOMAS** (1513-77). An English statesman and scholar, born at Saffron Walden in Essex and educated at Queens' College, Cambridge. He traveled and studied abroad, receiving honorary degrees from Padua, Cambridge, and Oxford. In 1544 he became regius professor of civil law in Cambridge and in 1548 was made Secretary of State. A zealous supporter of the Reformation, he lived in retirement under Mary, but in Elizabeth's reign became eminent as a statesman and diplomatist. In 1564 he negotiated the peace of Troyes with France. While in Paris he wrote his *De Republica Anglorum: The Maner of Government, or Policy of the Realme of England* (London, 1583; new ed. by Leonard Alston, Cambridge, 1906). From this date diplomatic missions occupied much of his time. In 1572 he succeeded Burleigh as Secretary of State, but retired in 1576. His *De Recta et Emendata Lingua Anglice Scriptio Dialogus* (Paris, 1568), a proposed reform in spelling, is interesting. Consult also John Strype, *Life of Sir Thomas Smith* (Oxford, 1820).

**SMITH, WILLIAM** (1728-93). A Canadian jurist and historian. He was born in New York City, graduated at Yale in 1745, and practiced law in New York. He was appointed Chief Justice of the Province of New York in 1763 and was a member of the Council in 1767-82. After the evacuation of New York by Sir Guy Carleton he went to England, where he remained until appointed Chief Justice of Canada, which office he filled until his death. When the Stamp Act was passed Smith devised a comprehensive plan of union of all the English colonies. During his term of office in Canada he established for the first time the employment of constables instead of soldiers in courts of justice. Consult D. C. Scott, *John Graves Simcoe* (Toronto, 1905), and A. G. Bradley, *Lord Dorchester* (ib., 1907), both in the "Makers of Canada Series."

**SMITH, WILLIAM** (1749-1867). A Canadian historian, son of William Smith, Chief Justice of Canada. He was born in New York City. He was appointed a member of the Quebec Provincial Executive Council in 1814. In 1815 he published in two volumes his *History of Canada from its First Discovery to the Year 1791*, a narrative unattractive in style, but valuable because of the author's access to first-hand material.

**SMITH, WILLIAM** (1769-1839). Called "the father of English geology." As a result of his investigations he formulated the principle that stratified rocks exhibit a definite order of succession and that the different horizons in the stratigraphical series may be identified by their included fossils. In 1794 he made a long tour through England, examining the geological structure of various regions and gathering evidence in support of his theories. Some of the data thus collected were published in *Order of the Strata and their Embedded Organic Remains, in the Neighbourhood of Bath, Examined and Proved Prior to 1799* (1799). After this he began the preparation of a geological map of England and Wales, which was supplemented

by separate maps of the counties published in colors on 21 sheets. These were the first geological maps of England to be published and the first attempt to show the distribution and arrangement of the rock formations of a whole country. His services were recognized officially by a government pension, while the Geological Society of London conferred upon him the Wollaston medal. Besides his geological contributions he published a treatise on *Irrigation* (1806). For an estimate of his scientific work, consult Sir Archibald Geikie, *The Founders of Geology* (2d ed., New York, 1906).

**SMITH, SIR WILLIAM** (1813-93). An English classical and biblical scholar. He was born in London and graduated at London University; was professor of Greek, Latin, and German in Highbury and Homerton colleges, then independent, and when they were consolidated as New College he became professor there of the Greek and Latin languages and literatures. He was editor of the *Quarterly Review* in 1867, was knighted in 1892, and was the editor of many valuable works, among them (in their latest editions): *English-Latin Dictionary* (1899); *Dictionary of Greek and Roman Antiquities* (1890-91); *Dictionary of Greek and Roman Biography and Mythology* (1890); *Dictionary of Greek and Roman Geography* (1854-57); *Dictionary of Christian Antiquities* (1875-80); *Dictionary of the Bible* (1863; rev. ed., 1887); *Dictionary of Christian Biography* (1877-87). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

**SMITH, WILLIAM ALDEN** (1859- ). An American lawyer and legislator, born at Dowagiac, Mich. He was early a newsboy, telegraph messenger, and page in the Michigan House of Representatives. Becoming office boy of the law firm of Burch & Montgomery, he studied law and after 1883 practiced at Grand Rapids. He was active in the Republican party, serving as State chairman from 1888 to 1892. Subsequently he was a member of Congress from 1894 to 1907, then resigning to enter the United States Senate. He was reelected in 1912. As Senator he became chairman of the Committee on Territories. While chairman of a subcommittee of the Committee on Commerce, appointed to investigate the causes of the *Titanic* disaster (1912), he showed lack of nautical knowledge, but the report was important in causing laws for greater safety at sea.

**SMITH, WILLIAM FARRAR** (1824-1903). An American soldier, born at St. Albans, Vt. He graduated from West Point in 1845 and (1846-48 and 1855-56) was assistant professor of mathematics there. He participated in the first battle of Bull Run, became brigadier general United States volunteers (Aug. 13, 1861), and was in command of a division in the Peninsular campaign from March to August, 1862. He was brevetted lieutenant colonel United States army for gallantry in the battle of White Oak Swamp (June 28, 1862). He became major general United States volunteers (July 4, 1862), was brevetted colonel United States army for gallantry at Antietam, and commanded the Sixth Corps of the Army of the Potomac (1862-63), when he was transferred to the Ninth Corps, serving till March 17. He commanded a division of the Army of the Susquehanna from June 17 to Aug. 3, 1863, and pursued the Confederates after the battle of Gettysburg. He was chief engineer, Department of the Cumberland, in 1863

and by building a bridge at Brown's Ferry (October 26) was able to join Hooker's forces with the Army of the Cumberland, saving the latter from possible capture at Chattanooga. He was again promoted to the rank of major general United States volunteers (March 9, 1864), and served with the Army of the Potomac from May 2 to July 9, 1864, before Richmond. He was brevetted brigadier general United States army (March 13, 1865) for services at Chattanooga and major general the same day for services during the war. From 1864 to 1873 he was president of the International Telegraph Company, and in 1877 became president of the board of police commissioners of New York. After 1881 he practiced civil engineering.

**SMITH, WILLIAM HENRY** (1825-91). An English statesman, born in London. He was elected to Parliament in 1868, became Secretary to the Treasury in 1874, and in 1877 entered the cabinet as First Lord of the Admiralty under Disraeli. In 1885 he served as Secretary for War and then as Chief Secretary for Ireland and in the following year became First Lord of the Treasury and leader of the House of Commons under the premiership of Lord Salisbury. In recognition of Smith's services his widow was created Viscountess Hambleden, with succession to his heirs.

**SMITH, WILLIAM HENRY** (1833-96). An American journalist, born at Austerlitz, N. Y. In 1855 he became editor of the *Type of the Times*, a political weekly at Cincinnati, and in 1858 was on the editorial staff of the *Cincinnati Gazette*. In 1863 he was private secretary to Governor Brough for one year and was then Secretary of State until 1867, when he resigned to take editorial charge of the *Cincinnati Evening Chronicle*, a new daily. In 1870 he became manager of the Western Associated Press at Chicago, and in 1883, upon its consolidation with the New York Associated Press as the American Associated Press, he became general manager of the new organization, remaining until 1893. In 1877 he became collector of the port of Chicago. His publications include *The Saint Clair Papers* (2 vols., 1882), containing much interesting material on the early history of the Northwest Territory, and *A Political History of Slavery* (1903), a narrative of antislavery and reconstruction.

**SMITH, WILLIAM SOOY.** See SOOY SMITH.

**SMITH, WILLIAM WAUGH** (1845-1912). An American college chancellor. He was born at Warrenton, Va., and served in the Confederate army in 1862-65. In 1871 he graduated A.M. from Randolph-Macon College, where he was professor in 1878-86 and president in 1886-97. He afterward organized and became chancellor of the Randolph-Macon System of Colleges and Academies, for which he raised large sums of money for buildings and endowment. Smith was author of *Outlines of Psychology* (1884), *A Parallel Syntax Chart of Latin, Greek, German, French, and English* (1885), and many special articles.

**SMITH COLLEGE.** An institution for the higher education of women at Northampton, Mass., chartered in 1871 and opened in 1875. The college was founded by Miss Sophia Smith (q.v.), of Hatfield. The undergraduate course combines certain fixed requirements with a plan of directed electives organized under a group system and leads to the degree of Bachelor of Arts. The degree of Master of Arts is also conferred. A number of annual scholarships in the

various departments provide incomes of \$75 to \$300 for needy students. Two tables at seaside laboratories are maintained by the college, which also contributes to the support of a table at the zoological station at Naples and to the classical schools at Athens and Rome. The college buildings, centrally located in the town, include College Hall, containing the offices of administration; Seelye Hall, with 20 recitation rooms; the John M. Greene Hall, an auditorium, with a seating capacity of about 2300; the Library, containing books and pamphlets to the number of 53,241; Lilly Hall of Science; Chemistry Hall, in part the gift of the class of 1895; a well-equipped observatory; Music Hall; the Hillyer Art Gallery, containing extensive collections, with an endowment of \$50,000 for their increase; the Alumnae Gymnasium; and the Lyman Plant House, which with the botanic gardens furnishes material for laboratory work and opportunity for special investigations. In 1915-16 the student enrollment was 1724 and the faculty numbered 163. The endowment was \$2,182,000, the grounds and buildings were valued at \$1,890,000, and the income was \$483,000. The president in 1916 was Marion L. Burton, D.D.

**SMITH-DORRIEN, SIR HORACE LOCKWOOD** (1858- ). A British soldier. He was educated at Harrow and entered the army in 1876. Between 1879 and 1886 he served with distinction in the Zulu War, in the Egyptian War, in the Nile expedition with the Egyptian army, in the Sudan campaign, and in the Sudan Frontier Field Force. Thereafter, until 1898, when he accompanied another Nile expedition, he served in various parts of India. In 1900, as major general, to which rank he had been promoted, he commanded a brigade and a division in the South African War. He was adjutant general in India (1901-03) and commanded the Fourth Division there (1903-07). He was made lieutenant general in 1906 and general in 1912. In 1907-12 he was commander in chief at Aldershot and in 1912-14 held the Southern command. On the outbreak of the European War in 1914 he was given command of an army corps in the British expeditionary force sent to France and led his corps with great skill and energy, both in meeting the onset of the Germans, who outnumbered the British four to one, and in conducting the retreat from Mons so as to preserve the morale and strength of his men. In December, 1915, he was given supreme command of the expedition against German East Africa. Shortly after beginning his campaign he was taken ill, resigned, and was succeeded by Gen. Jan Christian Smuts (q.v.). In 1904 he was knighted (K.C.B.), and later he received the G.C.B. and the G.C.M.G.

**SMITHFIELD, or SMOOTHFIELD.** An historic cattle market in London, mentioned as early as 1150 and since 1868 the seat of the Central Meat Market, covering 3½ acres. In the twelfth century Smoothfield was an open spot, which served the citizens as a playground and promenade. It was outside the city walls. Here Wat Tyler met his death in 1381, and the place is associated with trials by battle, tournaments, the burning of martyrs, and public executions during many centuries. The most celebrated fair in England, Bartholomew Fair (q.v.), was formerly held in Smithfield.

**SMITHS FALLS.** A town of Lanark County, Ontario, Canada, 39 miles south-southwest of Ottawa, on the Rideau River and Canal and on the Canadian Pacific and the Canadian Northern

railways (Map: Ontario, K 3). It possesses a public library, a collegiate institute, two hospitals, and a park. It has flourishing manufactures. Pop., 1901, 5155; 1911, 6370.

**SMITHSON, JAMES** (1765-1829). A British mineralogist and the founder of the Smithsonian Institution (q.v.) at Washington. In early life he was known as James Lewis (or Louis) Macie. He was born in France, the natural son of Hugh Smithson, first Duke of Northumberland, and of Mrs. Elizabeth Keate Macie, a member of the Hungerford family of Studley. He studied at Pembroke College, Oxford, and became a fellow of the Royal Society in 1787. He read 28 papers before the Royal Society and published 18 in Thomson's *Annals of Philosophy*. A large collection of minerals left by him were destroyed by fire in the Smithsonian Institution Building in 1865. He was associated with some of the most notable scientists of his time. Smithson passed a large part of his life on the Continent and died in Genoa, Italy. His remains were removed to the United States in 1904 and are interred in the grounds of the Smithsonian Institution. Smithson was never in America, and it is not known what induced him to give his fortune to the United States, except that a sense of wrong in the illegitimacy of his birth alienated him from his native land. Relative to his bequest, he wrote: "My name shall live in the memory of man when the titles of the Northumberland and the Percies are extinct and forgotten." Consult: W. J. Rhees, "Smithson and his Bequest," and "Scientific Writings of James Smithson," in Smithsonian Institution, *Miscellaneous Collections*, vol. xxi (Washington, 1879-80); S. P. Langley, "James Smithson," in *The Smithsonian Institution, 1846 to 1896* (ed. by G. B. Goode, ib., 1897); id., *Removal of the Remains of James Smithson* (ib., 1904).

**SMITHSONIAN INSTITUTION, THE.** An institution in Washington, District of Columbia, created by an Act of Congress on Aug. 10, 1846, in accordance with the will of James Smithson (q.v.), who bequeathed the reversion of an estate amounting to \$515,169 to the United States to be devoted to the "increase and diffusion of knowledge among men."

**History.** The regents appointed to carry out the provisions of Smithson's will elected Joseph Henry as executive officer. He recommended to "increase knowledge" by these methods: (1) to stimulate men of talent to make original researches by offering rewards for memoirs containing new truths and (2) to appropriate annually a portion of the income for particular research under direction of suitable persons. To "diffuse knowledge" he proposed (1) to publish periodically reports on the progress of different branches of knowledge and (2) to publish occasional separate treatises on general subjects.

Under Henry was begun the construction of a building, designed by James Renwick in Norman style, which has since been the home of the Smithsonian Institution. A library was formed by exchange and purchase and museum materials collected. Research was fostered. One of the first subjects to be studied under its direction was the phenomena of storms, and the investigations of Espy and others led to the establishment of a telegraphic weather service, subsequently the Weather Bureau. The material collected by exploring expeditions and Pacific railway surveys was deposited here, and that led in time to the formation of the United States National

Museum (q.v.). "Diffusion of knowledge" was inaugurated by issuing various publications. These include: (1) *Smithsonian Contributions to Knowledge*, a quarto series of memoirs embracing records of extended original investigations and researches, which began in 1848 with a monograph by Squier and Davis, and now comprises 35 quarto volumes. (2) *Smithsonian Miscellaneous Collections*, an octavo series of papers on the present state of knowledge on particular branches of science, which began in 1860. The series includes the valuable meteorological, geographical, physical, and mathematical tables. Since 1903 a quarterly issue has been published as part of this series. (3) *Annual Reports of the Board of Regents*, also octavo in form. These consist of the reports and proceedings of the officers of the institution, with a general appendix containing a selection of memoirs of interest to collaborators and correspondents of the institution, teachers, etc. These reports began in 1847 and have been published annually since. Each department of the institution also issues reports in its own field, and since 1910 the institution has had charge of the publication of the *Harriman Alaska Series*.

**Research Library.** The publication of these different series led to an extensive exchange with learned societies, resulting in a most notable collection, the greater portion of which has been deposited in the Library of Congress. A working library is maintained at the institution and includes some 300 current foreign and domestic scientific periodicals.

**International Exchanges.** In 1851 a system of international exchanges was established primarily for the circulation of the Smithsonian publications, but in 1867 the duty of exchanging official documents for similar works published by foreign departments was assigned to this service. This work was placed upon an international basis by treaty with various nations, as the result of a conference held at Brussels in 1886. Since the establishment of this department more than 4,000,000 packages of books have been distributed through it. In 1914 there were handled 341,667 packages. This bureau is supported by an annual appropriation from Congress.

**National Museum.** See UNITED STATES NATIONAL MUSEUM.

**Bureau of American Ethnology.** Early in its history the Smithsonian Institution showed an interest in American anthropology, chiefly in ethnology, with special reference to American Indians. From 1867 various exploring parties, under the direction of John W. Powell (q.v.), were sent out. Special mention is due the exploration of the Grand Cañon of the Colorado. Subsequently the United States Geographical and Geological Survey of the Rocky Mountain region was organized under Major Powell and the collections deposited in the National Museum. On the consolidation of the various geological surveys in 1879, the Bureau of American Ethnology was established by Act of Congress and placed under direction of the Smithsonian Institution; it has since been continued with appropriations from Congress. It publishes *Annual Reports*, quarto, begun in 1879, and a series of octavo bulletins begun in 1877; it also completed the *Contributions to North American Ethnology*, a series of nine quarto volumes begun in 1877. The first director of the bureau was Powell, who continued in that office until his death in 1902, when he was succeeded by William

H. Holmes. In 1916 the ethnologist in charge was F. W. Hodge, who took office in 1910.

**National Zoological Park.** A desire to preserve the wild animals of the continent that were disappearing led to the establishment of temporary quarters for captive specimens in the vicinity of the Smithsonian Building. This collection grew until in 1890 Congress appropriated \$200,000 for the purchase of about 170 acres of land in Rock Creek Valley, near Washington, and in that year established a National Zoological Park, under the direction of the Smithsonian Institution. A collection of over 1400 animals is cared for in the park.

**Astrophysical Observatory.** The early desire of the founders that a portion of the bequest should be devoted to research in physics found culmination, soon after the appointment of Langley to the secretaryship of the institution, in the annual appropriation by Congress, beginning in 1891, of \$10,000, since increased to \$14,000, for maintenance of an astrophysical observatory. Apparatus valued at about \$30,000 has been accumulated. Considerable investigation under the immediate direction of Langley was carried on, especially on the infra-red portion of the spectrum, and the observatory has issued a volume of *Annals*.

**Langley Aërodynamical Laboratory.** The laboratory was reopened in 1913 for the "study of the problems of aerodromics, particularly those of aerodynamics" with a view to securing the safety of aerial locomotion "for the purposes of commerce, national defense, and the welfare of man." The investigations tended to rehabilitate the Langley aeroplane, the first capable of sustained free flight with a man, and invented in 1896. See **AERONAUTICS**.

**Research.** In 1891 Thomas G. Hodgkins made a donation of \$200,000 to the Smithsonian Institution, of which the interest of \$100,000 is permanently devoted to the increase and diffusion of more exact knowledge of the nature and properties of atmospheric air. In accordance with this bequest a prize of \$10,000 was awarded to Lord Rayleigh and Sir William Ramsay in 1895 for the discovery of the element argon in the atmosphere. A medal bearing the name of Hodgkins, given for important contributions to knowledge concerning the nature and property of air, or for practical applications of existing knowledge to the welfare of mankind, was established and was awarded to James Dewar in 1899 for researches on the liquefaction and solidification of atmospheric air and in 1901 to J. J. Thomson for investigation on the conductivity of gases, especially gases composing air. Numerous grants from the Hodgkins fund have been made to students, both in the United States and abroad, engaged in this study. In 1903 the topic for the Hodgkins fund prize was on "the relation of atmospheric air to tuberculosis." For many years a table for original investigation in biology has been supported by the institution at the Naples Zoölogical Station. Beginning with 1906, Congress made an appropriation to continue this. In 1912 the Smithsonian Institution became connected, through the presence of its secretary on the board of directors, with the Research Corporation organized in New York in that year. The institution may receive funds for research and experimentation.

**International Catalogue.** Subsequent to a conference held in London in 1898, an international catalogue of scientific literature was

undertaken in England and cataloguing was begun about 1900. The collecting of titles of American scientific publications was accepted by the Smithsonian Institution and has since been conducted under its supervision. In 1914 the institution sent to London 28,606 reference cards, making a total of 318,936 prepared in the United States since 1901.

**American History.** In 1889 the American Historical Association (q.v.) was incorporated by Act of Congress and authorized to report annually to the secretary of the Smithsonian Institution concerning the condition of historical study in America. Collections, manuscripts, books, pamphlets, and other material for the history of this association are deposited in the Smithsonian Institution and the National Museum. In 1896 the National Society of the Daughters of the American Revolution was incorporated. Their collection is deposited in the National Museum.

**Funds.** To the original bequest of Smithson other gifts and bequests, including over \$200,000 from Thomas G. Hodgkins, have been added; also funds held in bonds and real estate devised to the institution; making the property which gives the income about \$1,000,000. The total resources available in 1914 amounted to \$124,623.94.

The institution has had the following secretaries: Joseph Henry, 1847-78; Spencer F. Baird, 1878-87; Samuel Pierpont Langley, 1887-1906; Charles Doolittle Walcott, 1906-

Consult G. B. Goode (ed.), *The Smithsonian Institution, 1846-1896* (Washington, 1897), and W. J. Rhees (ed.), *The Smithsonian Institution, Documents Relative to its Origin and History, 1835-1899* (2 vols., ib., 1901).

**SMITHSONITE** (named in honor of James *Smithson*). A mineral zinc carbonate crystallized in the hexagonal system. It has a vitreous lustre and is white to gray and light green and brown in color. It occurs with galena and other zinc minerals, also with copper and iron ores in veins and in beds, and is sometimes produced by the action of zinc sulphide on carbonated waters. The zinc is often partially replaced by copper, iron, or manganese. Smithsonite occurs crystallized or in botryoidal and stalactitic forms, granular or earthy. The rich colored varieties are occasionally cut for cabinet gems.

**SMITH SOUND.** The channel, about 30 miles wide, separating Ellesmere Land from the Prudhoe Land of Greenland and connecting Baffin Bay with Kane Basin (Map: Canada, Q 1). The sound was discovered by Bylott and Baffin in 1616. For subsequent explorations, see **POLAR RESEARCH**.

**SMOCK, JOHN CONOVER** (1842- ). An American geologist, born at Holmdel, N. J., and educated at Rutgers College, where he graduated in 1862. He became professor at Rutgers in 1871, after having studied for two years at the Mining Academy, Freiberg, and at the University of Berlin. From 1864 to 1885 he assisted on a geological survey in New Jersey and from 1890 to 1901 he was geologist of that State. He wrote *Climate of New Jersey* (1881), *Building Stone in New York* (1888), and volumes iii and iv of *Geological Survey of the State of New Jersey*.

**SMOHALLA** (c.1815-1907) (corrupted from *Shmoquala*, preacher, the name assumed by him in later life). The originator and high priest of the "Dreamer" Indian religion of the Columbia River region. He was chief of the Wanapum,

a small tribe living about Priests Rapids on the upper Columbia, Washington. About 1860 he announced that he had been in the spirit world, from which he had returned to deliver a new revelation, the burden of which was an immediate return to the primitive Indian customs. He fell into frequent prolonged trances, in which he was perfectly insensible to the most painful tests and from which he always emerged with a fresh revelation from the spirit world. He forbade his disciples to follow the white man's road, to use liquor or tobacco, or to sell their lands. His following soon included nearly all the Indians of eastern Washington and Oregon and western Idaho. About 1870 the matter came to the notice of the government from the refusal of the "Dreamers" to come under reservation restrictions. In 1884 his doctrines were made the subject of a special military investigation in connection with land troubles on the Yakima reservation. There were then two principal Dreamer churches—at Priests Rapids, where Smohalla resided, and at Union Gap on the reservation. Besides Sunday services at these, according to their own ritual, the Dreamers had a memorial lament for the dead in early spring, a salmon thanksgiving in April, and a berry thanksgiving in the fall, each being accompanied by processions, bell ringing, trance recitals, and a feast. Consult James Mooney, *The Ghost Dance Religion* (Washington, 1897).

**SMOKELESS POWDER.** An explosive substance that burns without developing much smoke and is used chiefly for military purposes. The present employment of smokeless powder may be said to have begun with the invention of *poudre B.* by Vieille in France in 1886.

Guttman divides the smokeless powders into three classes, as follows: (1) powders in which gun cotton, either the insoluble or the soluble variety alone, is used, which by the aid of a solvent has been converted into a plastic substance, then formed into flakes or cords and hardened or "indurated" by the evaporation of the solvent; (2) powders in which a mixture of nitroglycerin and either dinitro- or trinitro-cellulose is transformed into a rubberlike substance, either with or without the aid of a solvent; and (3) powders that contain nitroderivatives of the aromatic hydrocarbons, either by themselves or in connection with nitrocellulose. The nitrocellulose powders are those most generally used and the process of manufacture consists in steeping cellulose in a mixture of nitric and sulphuric acids and bringing the resulting nitrocellulose into the colloidal condition by treatment with some solvent such as a mixture of alcohol and ether, ethyl acetic ester, or acetone. The solvent chosen depends on the character of the cellulose nitrate used and the special qualities sought in the product. In certain of the smokeless powders oxidizing agents, such as the nitrates of metallic bases, are added to increase the velocity of combustion of the explosive, and when the action of the explosive is too violent a deterrent or substance rich in carbon is added. The colloid substance is then cut into flakes by machines, or as originally in Italy forced through spaghetti machines, and formed into cords, either solid or perforated, of the desired dimensions, which are then cut into grains and indurated.

Smokeless sporting powders for use in rifles are made in the manner described above for small-arm military powders, but they are too dense for use in shotguns and fowling pieces.

Hence a porous bulky grain, which is measured instead of being weighed out into charges, just as black sporting powder has for long been, is made by cementing together, with agitation, particles of nitrocellulose. Some are so lightly cemented that they may be easily crushed between the thumb and finger, and there is danger of such grains being crushed to dust in the chamber of the gun, producing there an excessive pressure. By Von Freeden's process of granulating an emulsion of cellulose nitrate in amyl acetate by rotation in water, a bulk grain is obtained which is hardened throughout and strongly resists crushing. All these powders yield a faint haze due to the condensation of combustion products. Though smokelessness is the characteristic of these powders which has attracted popular attention, their superior power is a factor of prime importance, for, while black gunpowder imparted to the projectile an initial velocity of 1700 feet per second, initial velocities of over 3000 foot seconds have been attained with smokeless powders, and this has compelled fighting modern engagements in open order and at long range and demanded an increase in thickness and resistance of the armor of battleships. See EXPLOSIVES.

Among the various smokeless powders are: *ballistite*, invented by Alfred Nobel in 1888, and made in England; *cordite*, invented by Sir Frederick Abel and James Dewar, and made in England; *Du Pont powder*, invented by F. C. & P. S. Du Pont in 1893, and made in Wilmington, Del.; *indwite*, invented by Charles E. Munroe in 1889, and made at Newport, R. I.; *cibalite*, invented by J. K. von Falkenstein, and made in Germany; *poudre J.*, invented by Bruneau, and *poudre pyroxyée*, made by the French government; *Troisdorf*, *Von Förster*, *Walsrode*, and *Wetteren* powders, made in Germany, each of which varies slightly from the others in the preparation of the mixture or proportions of the ingredients.

Consult the history of the development of smokeless powders given in Charles E. Munroe's presidential address before the Washington Section of the American Chemical Society in 1896; also J. A. Longridge, *Smokeless Powder and its Influence on Gun Construction* (London, 1890); O. Guttman, *The Manufacture of Explosives* (ib., 1895); J. B. Bernadou, *Smokeless Powder, Nitro-Cellulose, and Theory of Cellulose Molecule* (New York, 1901); P. G. Sanford, *Nitro-Explosives* (2d ed., ib., 1906); H. Brunswick, *Explosives: A Synoptic and Critical Treatment of the Literature*; English translation by Munroe and Kibler (ib., 1912).

**SMOKE NUISANCE.** Smoke is produced by the incomplete combustion of fuel, tiny bits of unconsumed matter being wafted into the air by the gases which are liberated and not decomposed. In order to effect complete combustion it is necessary that all the constituent gases be raised to a very high temperature and mixed with oxygen before the temperature falls.

In recent years a number of American states have authorized some or all cities within their boundaries to prohibit the emission of dense smoke from chimneys and smokestacks and to establish special departments to abate the smoke nuisance. The smoke nuisance has also been the subject of legislation in European countries, notably in Great Britain.

The exact effect of smoke on health has not been established, but, excluding sunlight and fill-

ing the air with soot and sometimes with gases, it is thought to be injurious. Studies at Pittsburgh have led to the conclusion that smoke there increases the mortality from pneumonia, but does not, to say the least, increase the tuberculosis death rate. The economic loss caused by smoke in cities is great, both through the imperfect combustion of coal that causes the smoke and also, and often far more, because of the damage it causes to buildings, furnishings, goods, and the like. The electrification of steam railways in cities lessens smoke, but not to such a degree as is popularly supposed. This and various other notable conclusions are presented in a report on Smoke Abatement and Railway Electrification at Chicago, made by the Chicago Railway Electrification Commission in behalf of the Chicago Association of Commerce, published at Chicago in December, 1915, and abstracted in the leading railway engineering papers of that time. Extensive studies of the whole smoke problem begun at Pittsburgh in 1912 are noted in the following bibliography.

Consult: W. Nicholson, *Smoke Abatement* (London, 1905); Booth and Kershaw, *Smoke Prevention and Fuel Economy*, based on the German work of E. Schmatolla (ib., 1908); W. M. Barr, *The Combustion of Coal and the Prevention of Smoke* (New York, 1913); Mellon Institute of Industrial Research, *Smoke-Investigation Bulletins* (Pittsburgh, 1912 et seq.), nine bulletins up to 1915 dealing with various phases, No. 2 (1913) being an extensive annotated bibliography; W. B. Munro, *Bibliography of Municipal Government* (Cambridge, Mass., 1915).

**SMOKE PIPE.** A pipe, usually of thin iron or steel, which serves to conduct the smoke and gases of a steam boiler to the open air. In large vessels there are usually several, in some instances with a diameter of more than 25 feet and a height of 125 feet above the furnaces. The area of the cross section of the pipe depends upon the amount and speed of the gases expected to escape. The speed of the moving gases (i.e., the draft) is much accelerated by increasing the height. Most steamship companies have adopted different-colored bands or painting for the smoke pipes of their ships as distinguishing marks.

**SMOKE TELEGRAPH.** See MILITARY AERONAUTICS.

**SMOKY (OR GREAT SMOKY) MOUNTAINS.** A division of the Appalachians. See UNAKA MOUNTAINS.

**SMOLENSK**, smō-lyěnsk'. A government of Russia (Map: Russia, D 3). Area, about 21,624 square miles. The northern part belongs to the central elevation of European Russia and is generally hilly. In the south and the east the surface is mostly level and marshy in the northwest. The Government of Smolensk is well watered by the Dnieper, Dūna, and several tributaries of the Volga and the Oka. The soil is mostly unfertile, and about one-third of the government is still covered with forest. The principal agricultural products are rye, oats, and flax. Stock raising is in a state of decline, while the house industry is only slightly developed. Of late there has been a considerable growth in the manufacturing industries. Oil, textiles, trimmed lumber, and spirits are the chief products. Pop., 1912, 2,050,200, chiefly Great and White Russians. The mediæval Principality of Smolensk is mentioned first as a separate state in 1054. It attained great power in the twelfth century, but declined greatly

under the sway of the Tatars and was annexed to Lithuania at the beginning of the fifteenth century. The region was permanently reunited with Russia in 1654.

**SMOLENSK.** The capital of the Government of Smolensk, Russia, situated on the Dnieper, 260 miles west-southwest of Moscow (Map: Russia, D 4). The main part of the city on the left bank of the river is surrounded by the remnants of the old walls and contains the Uspensky Cathedral, with a venerated picture of the Virgin. There are a seminary for priests and a historico-ethnological museum. The philanthropic institutions are numerous. There are few industries, and the export trade is unimportant. Pop., 1911, 71,311. Smolensk, sometimes referred to as the "key and the gate of Russia," is one of the oldest cities of Russia and is mentioned by Nestor as the capital of the Slavonic Krivitchi. It was the capital of the Principality of Smolensk and later obtained Magdeburg rights and other privileges from Lithuania. In 1514 it was taken by the Russians, and in 1611 it was recovered by the Poles, after a siege of 20 months. With its final annexation to Russia in 1668, Smolensk was deprived of its privileges and gradually lost its importance. It played a prominent part in the wars of Peter I with the Swedes and is especially noted as the scene of a fierce engagement between the French and the Russians in August of 1812, during which most of the town was burned and after which the Russians fled to Moscow, leaving Smolensk to the French forces.

**SMOLENSK**, MIKHAIL ILARIONOVITCH GOLENSHITCHEV, PRINCE OF. See KUTUSOV, M. I. G.

**SMOLENSKY** (or **SMOLENSKIN**), PEREZ (1842-85). A Hebrew writer and Nationalist, born near Mogilev, Russia. While studying the Talmud he read Russian and modern Hebrew literature and abandoned religious orthodoxy. Compelled to leave the *Yeshibah* of Shklov, he traveled through Russia, Austria, Germany, France, and England and made extensive studies. In the course of his travels he found confirmation for his idea that the essence of Judaism is a national and not a religious idea. In furtherance of this view he founded at Vienna in 1868 a periodical, *Ha-Shahar* (Daybreak), and in it published several novels from Jewish life. His masterpiece, *'Am 'Olam* (The Eternal People), became the platform of the Jewish Nationalist movement.

**SMOLLETT**, TOBIAS GEORGE (1721-71). A British novelist, descended from an old Scottish family having a seat called Bonhill, near Dumbarton, Scotland. Tobias wished to enter the army, but was thwarted by his grandfather, who appears in *Roderick Random* as the unamiable Old Judge. After attending the Dumbarton grammar school, Tobias was sent to the University of Glasgow to qualify for medicine, and was apprenticed (1736) for five years to Dr. John Gordon, of Glasgow. Much later (1750) he obtained the degree of M.D. from Marischal College, Aberdeen. In 1739 Smollett went to London with a tragedy called *The Regicide*. Embittered by his fruitless attempts to get it performed, he accepted the post of surgeon's mate on board the *Cumberland*, which sailed in 1741 to join Admiral Vernon's fleet, then in the West Indies, on the unfortunate expedition to Cartagena. On the return voyage he met in Jamaica a beautiful Creole, whom he brought to London and afterwards married (1747). He

left the navy for good in 1744, and settled in London as surgeon. As his profession did not prove remunerative, he turned to literature. After some parodies, satirical verse, and his vigorous poem, *The Tears of Scotland* (1746), anent the manner of crushing the Highland rebellion, he published his first novel, *Roderick Random* (1748), which met with instant success. For it he drew largely on family history, his journey from Glasgow to London, his troubles over *The Regicide*, and his experiences in the navy. Here first appear in fiction the real English tars. As a result of a visit to Paris (1750) he produced *Peregrine Pickle* (1751), containing the brilliant but brutal satire on Mark Akenside and the notorious "Memoirs of a Lady of Quality" (Frances Hawes, Lady Vane). For the insertion of these memoirs written by Lady Vane herself Smollett is said to have received a handsome fee. After practicing medicine for a short time at Bath Smollett returned to London and settled at Chelsea, where he wrote *Ferdinand, Count Fathom* (1753), more ideal in motive than his other novels. For some years he was engaged in hack work, translating *Don Quixote* (1755) and writing, among many other things, a history of England (1757-65). On the founding of the *Critical Review*, a Tory organ (February, 1756), Smollett became editor. He wrote many abusive articles, one of which, an attack on Admiral Knowles, led to a fine of £100 and imprisonment for three months (1759). In the meantime his farce *Reprisal, or the Tars of Old England* (1757) was performed at Drury Lane, under the direction of Garrick. Resuming the novel, Smollett contributed to the *British Magazine* (1760-61) *The Adventures of Sir Launcelot Greaves* (1762), an adaptation of *Don Quixote*. It is of bibliographical interest as the first English novel to appear in a serial. In 1762 he edited the *Briton*, a weekly paper started to defend the Tory policy of Lord Bute.

Broken in health and sorely grieved by the death of his daughter (1763), Smollett now spent two years on the Continent, where he wrote his *Travels through France and Italy* (1766). The next few years were passed in a visit to Scotland, at Bath, and in London. The most noteworthy production of this time is the fierce political satire, *The Adventures of an Atom* (1769). Now utterly unnerved, he left England never to return (December, 1769). At a villa near Leghorn in Italy he wrote *Humphrey Clinker* (1771), an amusing novel in letter form, based upon his own vain search for health at Bath and in the North. For 50 years after his death Smollett was ranked high as a novelist, but during the latter half of the nineteenth century his fame unduly sank. Thackeray was the last of the great novelists to praise him. His novels, constructed after the type of *Gil Blas*, possess no organic unity. On the other hand he wrote vigorous English and created many living characters.

**Bibliography.** His *Miscellaneous Works* have been published in various editions (6 vols., Edinburgh, 1790; 6 vols., London, 1796, with memoir by Robert Anderson; 12 vols., ib., 1895, ed. by G. E. B. Saintsbury; 12 vols., ib., 1899-1901, with introduction by W. E. Henley). Also the *Memoirs*, by W. Scott, containing a famous comparison between Fielding and Smollett, prefixed to Smollett's novels in the *Novelists' Library* (London, 1821); the *Quarterly Review*,

vols. ciii, clxiii (ib., 1858, 1886); R. Chambers, *Smollett: His Life and Selections from his Writings* (ib., 1867); David Hannay, *Life* (ib., 1887); "Topography of Humphrey Clinker," in Austin Dobson, *Eighteenth Century Vignettes* (2d series, ib., 1894); Sir Walter Raleigh, in *The English Novel* (ib., 1894); Oliver Smeaton, *Tobias Smollett* (Edinburgh, 1897); Harold Child, "Fielding and Smollett," in *Cambridge History of English Literature*, vol. x (New York, 1913), containing an exhaustive bibliography.

**SMOOT, REED** (1862- ). An American legislator, born at Salt Lake City, Utah. He graduated from the Brigham Young Academy, Provo, Utah, in 1879 and in 1900 was made one of the apostles of the Mormon church. He was president of a number of banks and corporations and had large holdings in realty, from all of which he accumulated a large fortune. From 1903 he was a member of the United States Senate. There was strong opposition to his serving on account of his position in the Mormon church, and in June, 1906, the Senate Committee on Privileges voted, 7 to 5, that he should be unseated. It was officially charged that he was a member of a body which encouraged polygamy. The charge that he himself was a polygamist was not supported by proof. The Senate in February, 1907, voted, 42 to 23, that he was entitled to his seat and appropriated funds to reimburse him. Smoot was one of the ablest of the Conservative Republicans and was regarded as a tariff expert. See **MORMONS**.

**SMOOTHFIELD.** See **SMITHFIELD**.

**SMRITI**, smrĭtē (Skt., memory). In Sanskrit literature, the technical term for those works, especially the Sutras (q.v.) which deal with civil and religious usage, regarded as based only on tradition derived from ancient sages and not on divine revelation. Consult A. A. Macdonell, *History of Sanskrit Literature* (London, 1913). See **SRUTI**.

**SMUCKER, SAMUEL.** See **SCHMUCKER, SAMUEL**.

**SMUGGLING** (from *smuggle*, LG. *smuggeln*, to smuggle). The act of fraudulently importing or exporting goods from a country in violation of a law. Such infringement of the laws is defined by the United States statutes substantially as follows: To "knowingly and willfully, with intent to defraud the revenue of the United States, smuggle or introduce into the United States any goods, wares, or merchandise subject to duty, and which should have been invoiced, without paying or accounting for the duty," or to "make out or pass, or attempt to pass, through the customhouse any false, forged, or fraudulent invoice." A person convicted may be fined not exceeding five thousand dollars, or imprisoned for a time not exceeding two years, or both. It is necessary to prove intent and knowledge of the wrongful act in order to convict, and the defense of innocent intention is often successful in preventing prosecution. Concealment of dutiable articles in baggage is punishable by the forfeiture of such articles, and the persons guilty are liable to a penalty of treble the value of them. The court may in proceedings other than criminal, arising under the revenue laws, direct the defendant to produce in court all bills of lading, invoices, books, etc., relating to the importation of the goods in question. Smuggled property is condemned and sold, and the proceeds, after payment of costs and

rewards for information, if any, are paid into the United States Treasury.

**SMUT BALL.** See **BUNT**.

**SMUT** (probably from *AS. smitta*, stain). A term for fungi, parasitic upon cereals and other plants, characterized by black dustlike masses (spores) which take the place of the natural seed parts and occur as well on leaves, stalks, flowers, and other plant organs. There are about a dozen genera of smuts and many species, nearly every kind of cereal being subject to the attack of one or more. In some species spores which, as a rule, are adhering to the grain when sown, germinate at the same time as the seed, the fungus entering the young plantlet in which it develops unseen until about the time the grain is beginning to head, when the flower or grain becomes filled with a mass of delicate threads which soon mature their spores for the infection of the next crop. In other species the infection takes place only during the flowering stage of the host plant. The common cereal smuts are roughly grouped into two classes: the stinking smuts, so called from their disagreeable odor, and the loose smuts. The former destroy only the kernel; the latter, which are dusty and are blown away, leaving a bare stalk, destroy the whole head. The amount of injury done the cereal crops is very great. A conservative estimate places the annual loss due to smut on the oat crop of the United States at \$18,000,000. Other crops and countries suffer in like manner.

The smuts of wheat, barley, rye, and oats can be controlled to a great degree by treating the seed prior to sowing with various fungicides. Oat smut (*Ustilago avenae*), barley smut (*Ustilago hordei*), and stinking smut of wheat (*Tilletia foetens*) may be controlled by soaking the seed for two hours in one pound of formalin in 45 to 50 gallons of water. Or the seed may be thoroughly wet with the solution and allowed to stand for the same length of time, after which the grain is sown. For the other smuts the hot-water or Jensen treatment is recommended. Two vessels of at least 20 gallons' capacity are filled with water (one at a temperature of 110°-120° F.; the other at 132°-135° F., and kept constantly at those temperatures). The seed is placed in covered baskets or loose bags and dipped into the first for one to two minutes and then plunged into the second vessel, raised and lowered several times for 10 to 15 minutes, and then spread to dry. In Germany drying the grain after soaking in cold water by placing it in a hot-air apparatus has given good results. The temperature of the air is about the same as that recommended for the hot water. In treating wheat and barley for loose smut (*Ustilago tritici* and *Ustilago nuda* respectively) a preliminary soaking for four hours in cold water is advised. For the stinking smuts of wheat (*Tilletia foetens* and *Tilletia tritici*) and the covered smut of barley (*Ustilago hordei*), soaking seed for 12 hours in copper-sulphate solution (one pound to 24 gallons of water) and dipping a few minutes into lime water is also recommended. In all these treatments the treated seed must not come in contact with smut in unclean grain bags, bins, or seeding implements. Evidence has been recently obtained that indicates wheat smut may winter over in the soil in parts of Washington and Idaho. A system of crop rotations is suggested where this condition prevails.

None of these treatments is of benefit in preventing maize or corn smut (*Ustilago maydis*). The black spores germinate upon the ground, in manure or other suitable locations, and quickly develop thin-walled colorless spores that are carried by wind, germinate upon the rapidly growing tissues of the corn plant, which they may infect locally at any time, and in a few weeks produce boil-like growths. Each smut mass is believed to represent a separate infection. Destruction by burning all smut balls, whenever found, is the only remedy. Throwing them upon the ground or manure heaps or feeding to stock will only aid in spreading the disease. Experiments with cows have shown that corn smut is not poisonous, as it is often believed to be, the animals having eaten 10 pounds or more daily without any noticeable inconvenience. See **BASIDIOMYCETES**; **UREDINALS**; **USTILAGINALES**; and **Plate of FUNGI, TYPES OF**.

**SMUTS**, smŭts, JAN CHRISTIAN (1870- ). A South African soldier and statesman. He was born in Cape Colony and was educated at the University of Cape Town and at Christ's College, Cambridge (of which in 1915 he became an honorary fellow). After being called to the bar he practiced law in Cape Town for a year, went to Johannesburg in 1896, and in 1898 was appointed by Paul Kruger State Attorney to the Transvaal Republic. During the South African War (1899-1902) he served under Gen. Petrus Jacobus Joubert (q.v.) in Natal and later under Gen. De la Rey (q.v.), after the fall of Pretoria. As commandant of the Boer forces in Cape Colony he made several destructive raids in the Cape districts in 1901. Smuts loyally accepted the results of the war, aided importantly in the work of reconstruction, and was Colonial Secretary of the Transvaal (1907-10). He was the ablest thinker and debater in the National Convention which resulted in the Union of South Africa in 1910. He became Minister of Finance and Defense in the cabinet of General Louis Botha (q.v.), the first Premier of the Union, and had a prominent part in enacting the Defence Act of 1912. During the labor troubles at Johannesburg, when strikes threatened, he proclaimed martial law and had the labor leaders deported. After the outbreak of the European War in 1914 he loyally cooperated with Premier Botha in the measures taken for the suppression of the Boer rebellions under Colonel Maritz and Gen. Christian Rudolph De Wet (q.v.), and in the campaign which resulted in the defeat of the Germans in German Southwest Africa and the conquest of that colony. In the general elections in the fall of 1915 Smuts was again returned as a member of Parliament and retained his position in the Botha cabinet. On Nov. 13, 1915, he was placed in supreme command of a South African military expedition against German East Africa; but shortly afterward, for reasons which in no way reflected on his ability or loyalty, the command was given to Gen. Sir Horace Smith-Dorrien (q.v.). Upon the latter's illness and resignation Smuts was reinstated, and in February, 1916, had reported considerable progress in his campaign. Consult P. J. Sampson, *The Capture of De Wet* (London, 1915). For his later activities in connection with the war and the League of Nations, see **SUPPLEMENT**.

**SMYBERT**, smīb'ert, or **SMIBERT**, JOHN (1684-1751). A Scottish painter, the earliest

noteworthy artist in America. He was born in Edinburgh and studied in London in Sir James Thornhill's academy (having Hogarth as a fellow pupil), and in Italy (1717). On his return he practiced portrait painting in London with considerable success. When Bishop Berkeley received permission from the British government in 1728 to found a college in the Bermuda Islands, he took Smybert with him to be professor of fine arts. But the promised funds were not forthcoming, and after remaining in Newport, R. I., three years, Berkeley returned to England. Smybert went to live in Boston and influenced the painters Copley, Trumbull, and Allston. His best work is "Bishop Berkeley and his Family," a group containing eight figures and the first of the kind produced in America. It was painted in 1731, presented to Yale College in 1803, and is now in the Dining Hall there. Other portraits, characterized by a dry formal style, but good in drawing and sincere likenesses, include those of Jonathan Edwards and Judge Edmund Quincy (in the Boston Art Museum); Governor Endeott, Peter Faneuil, and Mrs. Smybert (in the gallery of the Massachusetts Historical Society).

**SMYRNA**, *smër'na*. The capital of the Vilayet of Aidin (or Smyrna), the chief city of Asia Minor and the second seaport of the Ottoman Empire, situated at the head of the Gulf of Smyrna, and somewhat over 200 miles southwest of Constantinople, with which it is connected by rail (Map: Turkey in Asia, A 2). The city is laid out partly on level land and partly on the slopes of Mount Pagus and presents an imposing appearance from the sea. It is divided into five quarters: the Moslem Quarter, with its numerous minarets and narrow crooked streets; the Jewish Quarter, poor, overcrowded, and dirty; the Armenian and Greek quarters, well built and European in their cleanliness; and, finally, the European Quarter, with its fine quay, shops, and hotels. The centre of archaeological interest is Mount Pagus with its ruined castle and portions of the Acropolis walls, in which Greek masonry can be traced. Of considerable interest also is the Caravan Bridge, with its Greek and Roman foundations, although the statement that the stream crossed by it is the celebrated Meles is generally discredited. The mosque called Hissar Jami is of some interest. The finest Christian churches are the Greek cathedral of St. Photini and the Armenian cathedral of St. Stephen. Smyrna contains numerous schools maintained by the various nationalities which make up the heterogeneous population. A number of interesting collections and libraries are attached to some of the higher schools, and hospitals and other benevolent institutions are maintained by the foreign colonies. The industries are limited in extent, and the product for which the town is most famous, Smyrna rugs, comes from the small places around the city. The chief manufactures are silk, woolen, and cotton goods, pottery, leather, and some machinery and iron and steel products. The chief exports are figs, raisins, tobacco, rugs, silk, sponges, hides, cereals, etc. The imports are manufactures, coal, iron, dairy products, etc. Pop. (est.), 350,000, of whom over one-half are Greek. The Mohammedans constitute about one-fourth of the population.

**History.** Smyrna was an Aëlian colony, but early in the seventh century B.C. it was seized by exiles from Colophon and thus brought into

the Ionian League. Its situation, which commanded the route from Sardis to the coast, enabled it to develop a rich commerce, but excited the jealousy and aggressions of the Lydian kings. Gyges was defeated by Smyrna, but Alyattes about 575 B.C. captured and destroyed the city. Only a village remained at this point until after the Macedonian conquest. Antigonos began to build a new city on the shore a few miles southeast of the old site. His death (301 B.C.) checked its growth, but the new city was completed by Lysimachus. It was laid out with great magnificence and adorned with fine buildings, among which was the Homereum, where Homer was worshiped as a hero. The city had an excellent harbor and from its admirable situation soon became one of the finest and most flourishing cities in Asia. It was favored by the Seleucids (q.v.) and in 243 B.C. was declared by Seleucus II sacred and inviolable. It was treated with consideration by the Romans, and, when it suffered severely in 179 A.D. from an earthquake, the Emperor Marcus Aurelius helped to restore it. It is mentioned in the Apocalypse as the seat of a Christian church, and it is said to have been the scene of the martyrdom of Polycarp. Throughout the greater part of the Middle Ages Smyrna belonged to the Byzantine Empire. In the fourteenth century it passed into the possession of the Knights of St. John. The Mongols under Tamerlane destroyed it in 1402. Since the early part of the fifteenth century the town has belonged to the Turks. It was heavily bombarded by the allied war vessels during the war which began in 1914. See WAR IN EUROPE.

**SMYTH**, *smith*, **CHARLES HENRY, JR.** (1866- ). An American geologist. Born at Oswego, N. Y., he was educated at Columbia (Ph.B., 1888; Ph.D., 1890) and at Heidelberg (1890-91). From 1891 to 1905 he was professor of geology and mineralogy at Hamilton College and thenceforth held the chair of geology at Princeton. Smyth is author of many papers and reports on pre-Cambrian, economic, and chemical geology and similar subjects.

**SMYTH**, **CHARLES PIAZZI** (1819-1900). An English astronomer, born in Naples, Italy. He was employed in the observatory at the Cape of Good Hope under Sir Thomas Maclear and was astronomer royal of Scotland (1845-1888). He made elaborate studies of the Great Pyramid of Egypt, which he maintained was built by divine inspiration as a standard of weights and measures. He advocated this peculiar theory in *Our Inheritance in the Great Pyramid* (1864), and *Life and Work at the Great Pyramid* (3 vols., 1867). He also wrote *Three Cities in Russia*

(2 vols., 1858) and *On the Antiquity of Intellectual Man* (1868).

**SMYTH, HERBERT WEIR** (1857- ). An American classical scholar, born at Wilmington, Del. He was educated at Swarthmore College, at Harvard University, and at Göttingen. After teaching at Johns Hopkins he was appointed professor of Greek in Bryn Mawr College in 1888. In 1901 he accepted a similar position at Harvard, where from 1902 he held the Eliot professorship of Greek literature. He was professor in the American School of Classical Studies at Athens in 1899-1900. In 1904-05 he served as president of the American Philological Association. His most important publications are *The Sounds and Inflections of Greek Dialects*; *Ionian* (1894); *Greek Melic Poetry* (1900); *Greek Grammar* (1914).

**SMYTH, or SMITH, JOHN** (c.1555-1612). An English clergyman. He graduated at Christ's College, Cambridge, in 1575, became a fellow of his college, and took orders. He preached in Lincoln (1603-05); then, influenced by the Brownist movement (see **BROWNSISTS**), he left the Established church and set up an independent congregation at Gainsborough in 1606. About 1608 he went to Amsterdam, where he adopted Baptist principles and publicly baptized himself, whence he gained his name of the Se-Baptist. His views changed rapidly, and in a short time he and those who agreed with him were excommunicated by the Amsterdam church. After his death (at Amsterdam, 1612) the remnant of his followers joined the Mennonites. He was the author of some of the first expositions of General Baptist principles printed in England, and hence has been regarded as the "father" of the English General Baptists. Consult: H. M. Dexter, *The True Story of John Smyth, the Se-Baptist* (Boston, 1881); A. H. Newman, *History of Antipedobaptism* (Philadelphia, 1897); Edward Arber, *The History of the Pilgrim Fathers as Told by Themselves, their Friends, and their Enemies* (Boston, 1897).

**SMYTH, JOHN PATERSON** (?1856- ). A Canadian clergyman and author. He was born in Ireland, graduated at Trinity College, Dublin, and was ordained a priest of the Church of England in 1881. After holding various charges in Ireland he was appointed canon of Dublin Cathedral in 1907. He was professor of pastoral theology in Trinity College, Dublin, in 1902-07. In the latter year he went to Canada and was appointed rector of St. George's Church, Montreal. He became a canon of Christ Church Cathedral in 1910 and archdeacon in 1914. His writings include: *Israel's Prophets and Kings* (1906); *Life and Letters of St. Paul* (1907); *The Prayer Book* (1908); *How God Inspired the Bible* (1909); *The Gospel of the Hereafter* (1910); *How we Got our Bible* (1899; new ed., 1912); *The Bible in the Making in the Light of Modern Research* (1914); *God and the War* (1915).

**SMYTH, (SAMUEL PHILLIPS) NEWMAN** (1843-1925). An American Congregational

clergyman, born at Brunswick, Me. He graduated at Bowdoin College in 1863 and afterward served as lieutenant in the Sixteenth Regiment of Maine Volunteers, which saw active service in Grant's Virginia campaigns. He graduated at Andover Theological Seminary in 1867 and filled pulpits in Bangor, Me., and Quincy, Ill., and then for 26 years (1882-1908) was pastor of the First Congregational Church at New Haven, Conn. His publications include: *The Religious Feeling: A Study for Faith* (1877); *Old Faiths in New Light* (1879); *The Orthodox Theology of To-Day* (1881); *The Reality of Faith* (1884); *Christian Facts and Forces* (1887); *Christian Ethics* (1892); *The Place of Death in Evolution* (1897); *Through Science to Faith* (1902); *Passing Protestantism and Coming Catholicism* (1908); *Modern Belief in Immortality* (1910); *Constructive Natural Theology* (1913).

**SMYTH, WILLIAM HENRY** (1788-1865). An English naval officer, the son of an American Loyalist, born at Westminster, London. For nine years he was engaged in making a survey of the Italian, Sicilian, Greek, and North African coasts and constructed charts that form the basis of those still in use. He was one of the founders of the Royal Geographical Society, of which he was president in 1849-50, and was president of the Royal Astronomical Society in 1845-46. He attained the rank of admiral in 1863. Among his works are: *Memoir . . . of the Resources, Inhabitants, and Hydrography of Sicily and its Islands* (1824); *The Cycle of Celestial Objects for the Use of Naval, Military, and Private Astronomers* (2 vols., 1844); *The Mediterranean: A Memoir, Physical, Historical, and Nautical* (1854).

**SMYTHE, ETHEL** (1858- ). An English composer, born in London. After a short stay at the Leipzig Conservatory she went in 1877 to Herzogenberg. At first she devoted herself to writing songs and chamber music, a string quintet and a sonata for violin and piano being produced in Leipzig. A mass in D, produced in London in 1893, attracted attention in England, but it was not until the production of her first opera, *Fantasio* (Weimar, 1898), that she became more widely known. Her second opera, *Der Wald* (Dresden, 1901), attained more than average success, being produced the following year in London, and one year later at the Metropolitan Opera House in New York. Her most ambitious work is *The Wreckers*, produced as *Strandrecht* in Leipzig (1906). The outbreak of the War of 1914 prevented the performance of *The Boatswain's Mate* at Frankfurt. It was produced in London (1916). She also wrote an overture, *Antony and Cleopatra*, and a *Serenade* for orchestra.

**SNAIL** (AS. *snægel*, snail). The name applied to many gastropod mollusks, but more especially to the terrestrial air-breathing gastropods (Pulmonata) and to the fresh-water gastropods such as the pond snails (*Physa*, *Lymnaea*, etc.). The Pulmonata are gastropods with

# NORTH AMERICAN SNAILS

COPYRIGHT, 1902, BY ODD, MEAD & COMPANY

*For Names and Description see Article "Snail"*

two pairs of tentacles, the nervous ganglia concentrated around the oesophagus and fitted to breathe air through a pallial cavity formed by the union of the front edge of the mantle with the neck region. The spiral shell is either well developed or in the slugs either vestigial or absent. The eyes are either at the base of the tentacles or situated at the end of the larger pair. Snails are mostly plant eaters or live on dead leaves, cutting their food by means of the long slender rasplike radula or "lingual ribbon." After passing through the cleavage, gastrula, and trochophore stages a definite veliger stage is finally attained. Soon the definite molluscan characters are assumed. The range of form and type of coloration is shown on the accompanying Plate.

**Use as Food.** In southern Europe and France snails are everywhere eaten, and snail gardens (*escargotières*) still exist in France, also at Brunswick and Ulm, in Germany, and at Copenhagen. When snails are eaten directly after being collected, they may, from having fed on some poisonous matters, prove harmful. They should be fed in gardens previous to being eaten. Consult: Amos Binney, *Terrestrial Mollusks of the United States* (ed. by A. A. Gould, 5 vols., Boston, 1851-78); A. H. Cooke, "Molluscs," in *Cambridge Natural History*, vol. iii (New York, 1895); Ingersoll, "In a Snailery," in *Wild Life of Orchard and Field* (ib., 1902).

**SNAIL, WHITE.** See **NATICA**.

**SNAKE** (AS. *snacu*, Oícel. *snākr*, *snōhr*, snake, from AS. *snican*, to creep, Eng. *sneak*; ultimately connected with Skt. *nāga*, snake), or **SERPENT**. A reptile representing the highly specialized saurian order Ophidia. Snakes differ from their nearest relatives the lizard, primarily in having the halves of the lower jaw connected by an elastic band. They agree with them in many particulars, and the external resemblance is so close in some cases that the true relationships were long confused. Although snakes as a whole form an ascending series, degeneracy has played an important part in their phylogenetic history. This degeneracy consists mainly in the reduction of the mechanism for rapid movement, the shortening of the tail, and the decrease in the size of the eye and mouth. The most highly developed are those with a poison apparatus, and among these the rattlesnakes seem most advanced. The form is greatly elongated and ordinarily cylindrical, but in the sea snakes (q.v.) is likely to be laterally compressed in adaptation to an aquatic life. The body is clothed in scales (q.v.), which are folds in the skin, lacking osteoderms and covered with a horny epidermis. Ordinarily they overlap, like tiles on a roof, but sometimes are flat and edge to edge, like tiles in a floor. They are small on the back and sides, lie in a definite number of equilateral longitudinal rows, and frequently are ridged or keeled; but on the ventral surface (except in the burrowers and sea snakes) are so large as to reach from side to side, forming abdominal scutes (gastrosteges in front of cloaca and urosteges behind), each attached at both ends to a pair of ribs. The scales are often enlarged on the head into plates or shields. (See illustration.) The arrangement and shape of both the head plates and the gastrosteges are of great service in classification. In some the nasal plates are broadened, turned up, or bear curious appendages, as in *Herpeton* and the langaha (qq.v.). Periodically, usually

several times a year, the snake sloughs off its corneous epidermis, which splits across the face and then is removed by the animal scraping

Numbers and letters: e, eye; n, nostril; 1, rostral plate; 2, nasal; 3, loreal; 4, preocular or anteorbital; 5, postocular or post-orbital; 6, temporal; 7, internasal; 8, prefrontal; 9, frontal; 10, superciliary or supraocular; 11, parietal; 12, notch in rostral for protrusion of tongue; 13, labial; 14, infralabials; 15, gular; 16, mental; 17, submental; 18, abdominal scutes or gastrosteges; 19, dorsal scales; 20, keeled body scales; 21, unkeeled lateral scales; 22, divided anal scute covering anus; 23, urosteges.

through a crevice or a fold of its own body; even the coating of the eye is included.

All snakes except the purely aquatic ones move by means of the abdominal scutes. No snake can leap from the ground; the more active sometimes hurl themselves from bough to bough or to the ground. The vertebrae are numerous, sometimes nearly 300, and are concave in front and convex behind, connected by free ball-and-socket joints, and provided with complicated processes, one effect of which is to prevent any considerable vertical motion. Every vertebra except the atlas bears a pair of ribs, articulating by the capitular head only, and united at their ventral extremities (in the ab-

NASAL APPENDAGES OF HERPETON.

sence of any sternum) by cartilages attached to the gastrosteges. The ribs admit of much movement and have an extensive and powerful musculature. The bones of the skull are not soldered together (except those of the brain case), but are loosely joined by elastic cartilages. The halves of the lower jaw are connected by a ligament so loose and elastic that they are capable of separation to a great extent. The teeth are simple, sharp, curved backward, and solidly

fixed in sockets. When broken or lost they are renewed. There are typically two rows on the upper jaw and two on the palate (maxillaries, palatines, and pterygoids), and each mandible of the lower jaw bears a single row; but vipers and rattlesnakes have none in the upper jaw except the poison fangs, which are depressible at will and fold back out of the way of food entering the mouth. The process of swallowing is laborious. With a large victim it may last hours, the head and throat stretched almost to bursting, and the snake nearly exhausted by its efforts. A great amount of saliva is poured out in this process, but the story that snakes cover their prey with slime before swallowing it is a fable.

Most snakes are carnivorous. Small mammals, frogs, reptiles, and insects form the bulk of the diet of ordinary land species. Some of them eat eggs, and a few species are fond of milk. Many are of great assistance to the agriculturist by devouring grasshoppers, mice, gophers, and other farm pests. The stomach is long and narrow, as also are the lobes of the liver. Snakes drink much water when in active life, yet they possess no urinary bladder. The intestines are highly absorbent. The heart is placed well forward. The lungs are elongated, and when bilobed, as in boas and rattlesnakes, one lobe is far larger than the other. The trachea is long, is provided with air sacs, and opens far forward in the mouth, which guards against suffocation during the tedious process of swallowing. The forcible expulsion of air from the trachea makes the hissing sound which is the serpent's only vocal utterance; but the bull snake has special tracheal arrangements (see illustration) by which its hiss may be increased to a sort of bellow.

Snakes have a well-developed nervous system and are intelligent. Many may be tamed and show docility. Most of them are timid and harmless, endeavoring to frighten enemies by menacing attitudes (see HOXOSES) or otherwise. Even the well-armed poisonous ones, though sullen and resistant, are rarely aggressive. All have good eyes and some of the many nocturnal forms very large ones; but the eyes have no lids and are not movable. No external ear is present, but a complicated internal apparatus exists,

MOUTH OF A SNAKE.

Open mouth of the bull or pine snake (q.v.) showing the (black) tongue and opening of the windpipe: *a*, sheath of the tongue; *b*, epiglottis; *c*, glottis.

so that snakes hear well and are affected by musical sounds. The sense of taste is probably deficient, but that of smell is acute, and some serpents, as the American black snake, hunt largely by scent. Many serpents lay eggs, but most venomous ones and many of the commonest species are viviparous. The young are ready to take care of themselves as soon as they leave the egg, but are usually guarded for a time by the mother.

A remarkable means of livelihood and of

defense among snakes is the poison apparatus with which one large group (Solenoglypha) and some members of the generally harmless Colubridæ are provided. This consists of a pair of very large labial glands, one beside each upper jaw, modified from parotid salivary glands and con-

POISON APPARATUS OF A RATTLESNAKE.

*a*, poison gland; *a'*, poison duct leading to the fang; *b*, anterior temporal muscle; *b'*, mandibular portion of same; *c*, posterior temporal muscle, *d*, digastric muscle; *f*, sheath of fang; *g*, middle temporal muscle; *h*, external pterygoid muscle.

taining saliva imbued with an alkaloid poison, usually fatal to all animals into whose circulation it enters. (See illustration.) These fangs are of three kinds. They may be the most forward of the maxillary teeth in the upper jaw, immovable and deeply grooved on the anterior side, as in the cobras and others of the Proteroglypha; or they may be thus fixed and grooved, but posterior in position (Opisthoglypha); or they may be lengthened and the maxillary bone so hinged as to dip down, allowing the fangs when not in use to lie back in a fold of the gum (where there are no other teeth); and the fang groove may be closed over for most of its length, forming a canal opening near the point of the tooth,

A FANG.

Poison tooth of a rattlesnake: *a*, dentine of the tooth; *b*, poison duct, leading into it; *c*, the canal groove; *d*, pulp cavity.

as in vipers and rattlesnakes. This contrivance carries the poison into the deepest part of the wound. When the snake is about to bite the mouth is opened very wide, the fangs unsheathed, swung forward and fixed by muscular contraction, and then sunk into the flesh of the victim with a marvelously sudden and swift forward and downward stroke. Secondary and partly involuntary action of other muscles presses the poison out of the gland and through the duct and tooth. The venom will sometimes exude and drip from the fangs of a snake excited and ready to strike, and some of this may be blown forward by the forcible expulsion of the animal's breath; but the stories of "spitting poison" have no better foundation than this. For the nature, effects, and antidotes of snake poison, see TOXICOLOGY.

The older families of snakes are circumtropical; none are found where a cold climate prevails. The great family Colubridæ is cosmopolitan, as also is the Boidæ, being absent only from New Zealand, which, like most oceanic islands, has no serpents, and from the colder latitudes. Their near allies, the Amblycephalidæ, are altogether Oriental and Malayan. The

3. CHAIN SNAKE (*Ophibolus getulus*).

4. BLACK SNAKE (*Zamenis constrictor*).
5. HOGNOSE (*Heterodon platyrhinus*).
6. PINE SNAKE (*Pituophis sayi*).

Viperidæ (including the crotaline group) are cosmopolitan, but no true vipers occur in America, whereas some crotalines are found in southern Asia, although all the rattlesnakes proper are American. The number of species of snakes is about 1800.

Snakes perform an important part in preserving the balance of life, for all are carnivorous and prey principally upon insects and the small animals, mostly rodents, which tend to multiply excessively. They are therefore of great service to agriculture in keeping down the hordes of injurious locusts, mice, gophers, and the like, which afflict the farmer. Their flesh is white, chicken-like, and wholesome and is eaten by savage peoples and occasionally by persons in civilization who are free from the traditional prejudice.

**Fossil Snakes.** About 35 species of Tertiary fossil snakes are known, and none of them presents any wide differences from its nearest living allies. They occur mostly in the fresh-water Tertiary deposits of Germany, France, England, and North America. No undoubted snake remains are known which are older than the Tertiary period.

See BOA, and PLATE; RATTLESNAKE, and PLATE; VIPER; and other names of the various groups and species of serpents; also PLATE of AMERICAN HARMLESS SNAKES and of FOREIGN VENOMOUS SERPENTS herewith.

**SNAKEBIRD.** A steganopode bird with a long bill, which is sometimes known as the darter (q.v.).

**SNAKE CHARMING.** A popular form of amusement which has existed in Egypt and throughout the East from remote antiquity. There are allusions to serpent charming in the Old Testament, and classical writers refer to it.

Serpent charmers ascribe their power over snakes to some constitutional peculiarity; the power is often handed down in a family. It is supposed that the poisonous snakes used for the purpose have had fangs and poison glands removed but sometimes, at least, this is not the case. The assertion that snake charmers are immune from the poison of such snakes as the cobra or the rattlesnake is not credited by authorities, and the stories told about the effective use for this purpose by American Indians of certain herbs are not credited by scientific observers. See COBRA; RATTLESNAKE.

Certain feats of the snake charmer depend upon knowledge of the nature and peculiarities of the reptile. Many species like music; to the sound of the flute they will rise and sway the upper part of the body, while it rests upon the spiral formed by the lower half. The asp has no external ear and is deaf as to whistling or the sound of the pipe, but the snake's glance can be attracted to a moving object and it will follow the rhythmical movement. The Oriental snake charmer is reputed to have the power of removing serpents from the vicinity of houses by luring them out of their holes by magic words and music.

**SNAKE DANCE.** A ceremony of the Hopi (Moki, Moqui) Indians of northeastern Arizona in which the handling of live rattlesnakes is a striking feature. The ceremony is held every two years, alternating with the flute dance, and in only five of the seven pueblos, at a date near August 20. The most frequently visited dances are those of Walpi (odd years) and Oraibi (even years). The celebrants are the Snake and Antelope fraternities, whose meeting places are in separate kivas or underground chambers allotted to these societies. The public dance is the culmination of nine days' secret rites in the kivas, during which an extremely complicated ritual is carried on, the chief features being the gathering of snakes from the world quarters, the snake washing, and the snake drama. On the morning of the eighth day the Antelope Fraternity foot race occurs, and in the afternoon follows the Antelope dance, which is identical with the first portion of the snake dance proper which takes place the next day. The morning of the ninth day is ushered in with the snake drama and race, the runners coming to the pueblos from a spring some miles distant at sunrise. About five in the evening the costumed and painted dancers file into the plaza, at one side of which the kisi, a small hut of cottonwood boughs, has been erected as a house for the snakes. The Antelope priests appear first and make a circuit of the plaza four times, and during this procession each man stamps on a small board sunk in the ground, supposed to cover the entrance to the underworld, and throws sacred meal upon it. This action is for the purpose of notifying the dwellers of the underworld that a ceremony is going on. The Antelope priests line up at the side of the kisi, in which the snakes have already been placed, and the Snake priests make their circuit and form in line facing them. A low weird chant begins, growing louder and marked by the rattles in the hands of the Antelope chorus. After the Antelope dance of the preceding day has been reenacted the Snake priests form in groups of three and dance with a curious hopping step around the plaza, while the Antelope priests remain in line and sing. When the trios

come near the kisi, the snake carrier drops on his knees and is handed a snake, which he grasps with his mouth about the middle, and, rising, dances with his two attendants around the plaza three times, when he drops the snake to the ground and secures another. One attendant places one hand upon the shoulder of the carrier and in the other holds a wand or "snake whip" of eagle plumes, which he waves in front of the snake. The other attendant, also armed with a feather wand, gathers up the snakes dropped by the carrier and holds them in his hands.

A third group of actors in this ceremony are women and girls arrayed in ceremonial costume and carrying plaques of sacred meal. Their office is to sprinkle the dancers with meal as they pass. When all the reptiles have been duly carried around the plaza, there is a pause while a cloud design in meal is thrown on the ground. Upon this the snakes are thrown, and a wild scramble for them ensues, and each priest runs with his prizes down the trails and sets them free at the prescribed places in each of the four directions. When the priests return they remove their trappings and drink of a powerful emetic for the purpose of purification. There follows general feasting by the entire pueblo. Several species of snakes are used in the ceremony, though from the nature of the case the rattlesnake preponderates. So far as is known no dancer has died from the bite of a snake in the ceremonies; it is exceedingly rare that they are bitten; the preliminary handling and the careful though seemingly fearless manipulation of the snake are sufficient to prevent accident. The ceremony is in effect a petition to the nature powers to give rain as the fundamental good in the arid region.

Consult: J. W. Fewkes, "Tusayan Snake Ceremonials," in *Bureau of American Ethnology, Sixteenth Annual Report* (Washington, 1897); Walter Hough, *The Moki Snake Dance* (Chicago, 1898); Dorsey and Voth, "Mishongnovi Ceremonies of the Snake and Antelope Fraternities," in *Field Museum of Natural History, Publications, No. 66* (ib., 1902).

**SNAKE FEEDER.** See DRAGON FLY.

**SNAKE FLY.** A neuropterous insect of the family Raphidiidae, allied to the hellgramite flies (*Corydalids*) and so called on account of the long flexible "neck." They occur in Europe and on the Pacific coast of the United States and spend their life upon trees. They are known by the prolonged necklike prothorax; and the female has a long curved ovipositor, to place its eggs deep in bark crevices. The cruciform larvae are active and voracious, developing in rotten wood and the dust under loose bark and preying upon other insects and their young. They are assiduous as food hunters and kill many larval codling moths and other fruit pests. The larva makes no cocoon, but changes to pupa beneath the shelter of bark, and begins to move about before it retransforms to the imago state. Consult L. O. Howard, *The Insect-Book* (new ed., New York, 1914).

**SNAKE-HEADED FISH, or SERPENT HEAD.** An East Indian fish of the family Ophiocephalidae, relating to the climbing fish (q.v.) and so called on account of the long eel-like form and the flattened head, which is covered with large scales.

**SNAKE INDIANS.** See SHOSHONE.

**SNAKE MELON.** See MUSKMELON.

**SNAKE RIVER**, also called SHOSHONE. The largest tributary of the Columbia River (q.v.) (Map: Oregon, H 3). It rises among the high peaks of the Rocky Mountains in Yellowstone Park. From Shoshone, Lewis, and Hart lakes in that park the South Fork flows southward, widening into Jackson Lake (18 miles long and 4 miles wide), from which it passes through Jackson valley (40 miles long and 8 miles wide). Near the Idaho-Wyoming boundary it enters a long cañon in which occur the famous Shoshone Falls (q.v.). It receives the North Fork in the southern part of Fremont Co., Idaho, and then flows westward across Idaho to a point near the Oregon-Idaho line. Here it turns suddenly northward and for about 170 miles forms the boundary between those States and for more than 30 miles between Idaho and Washington. It crosses into Washington at Lewiston, flows northwest, west, and southwest and joins the Columbia near Pasco. The stream is about 900 miles long and offers immense water power, while its basin has many feasible storage sites, only a few of which have been developed.

**SNAKE RIVER.** See COATZACALCOS.

**SNAKEROOT.** See COITOSII; POLYGALA; SERPENTARIA; and Plate of GOLDENROD, ETC.

**SNAKE'S HEAD.** See FRITILLARY.

**SNAKEWEED.** A name for bistort (q.v.).

**SNAKEWOOD.** See CECROPIA; LETTERWOOD.

**SNAPDRAGON** (*Antirrhinum*). A genus of about 25 species of annual and perennial herbs of the family Scrophulariaceae, chiefly natives of

COMMON SNAPDRAGON.

the temperate parts of the Northern Hemisphere. The English name refers to a peculiarity of the corolla, the lower lip of which, if parted from the upper so as to open the mouth, shuts with an elastic spring or snap. Common snapdragon

(*Antirrhinum majus*), a favorite plant with many fine varieties used for flower beds, borders, and rockeries, is the most frequently cultivated species. It is a native of Europe and bears racemes of variously colored flowers. The plants are propagated by seeds sown in gentle heat early in spring; the seedlings are transplanted to pans or pots and after having been hardened to light and air are set out in the open ground during May. Seeds are often sown as soon as they have ripened in the summer, the young plants being protected in cold frames until they are transplanted the following spring. Choice varieties are often increased by cuttings made in the fall from well-formed flowerless shoots. This species and *Antirrhinum orontium* have been introduced from Europe and are occasionally met with in a naturalized state.

**SNAPPER.** A name given to several active, marine, carnivorous fishes of the family Lutianidae (and to some others) on account of their voracity and quick biting at food. They are related to the sea bass and drumfish. The name especially applies to the members of the "pargo" genus *Neomænis*, many species of which inhabit warm seas, especially along the American and African shores, and are highly valued as food. The best known and most valuable is the red snapper (*Neomænis aya*) or "pargo colorado," which is known on rocky banks as far north as New York, but is very numerous in the Gulf of Mexico. It reaches a length of 2 feet or more and is one of the best of American food fishes. The gray snapper (*Lutianus griseus*), sometimes called gray mangrove snapper or Pensacola snapper, in Florida attains an average weight of about two pounds, but averages five pounds along the coast of Cuba. It is considered an excellent food fish and in Florida a game fish as well. It resembles the red snapper in general contour, but is colored dark greenish gray on the back and sides and reddish below. The fish inhabit coastal waters as far north as the New Jersey coast. Consult G. B. Goode, *Fishery Industries*, sec. i (Washington, 1884), and D. S. Jordan, *Fishes* (New York, 1908). See Colored Plate of FOOD FISHES with article FISH AS FOOD.

**SNAPPING BUG.** See CLICK BEETLE.

**SNAPPING TURTLE.** A large fresh-water tortoise (*Chelydra serpentina*) of the rivers and marshes of North and Central America, noted for its fierceness. It sometimes exceeds 3 feet in length, but ordinarily is about half that. Its shell is too small to permit it to retract either the snakelike head and neck or the long tail. The carapace is covered with pyramidally thickened plates, and the plastron is reduced to a cruciform shape. Its jaws are large and so strong that often it may be lifted from the ground by the object it bites. It feeds upon fish and all sorts of small aquatic animals. A second species belongs to the lower Mississippi valley—the alligator snapper (*Macrochelys lacertina*), which is larger and is considered for its size the strongest of reptiles. These turtles, early in June, seek a sand bank, where the females dig holes with their hind feet and bury 25 or 30 small spherical eggs, smoothing the sand carefully over them. These two species constitute the family Chelydridæ.

**SNARE DRUM** (AS. *snear*, sinew + *drum*). The ordinary small military drum. It is built of a hollow body made of brass, over both ends of which a membrane is stretched which can be tightened or loosened. Across the lower mem-

brane are stretched several strings of catgut, which vibrate and act upon the lower membrane very much like drumsticks. Thus a bright piercing sound is produced. See DRUM.

**SNEEK**, snāk. A town in the Province of Friesland, the Netherlands, to the west of the Sneekmeer and 24 miles southwest of Leeuwarden (Map: Netherlands, D 1). There are a Gymnasium, an industrial institute, and some metal manufactures. Pop., 1900, 12,075; 1913, 13,954.

**SNEERWELL**, LADY. See SCHOOL FOR SCANDAL.

**SNEEUWBERGEN**, snā'ū-bēr'gen. A range of mountains in South Africa. See CAPE OF GOOD HOPE.

**SNEEZEWORT.** An herb. See ACHILLEA.

**SNEEZING.** The involuntary spasmodic expirations caused either by direct or reflex irritation of the sensory nerves of the nasal mucous membrane. The causes of excessive sneezing may be broadly divided into two classes, extrinsic and intrinsic. Extrinsic causes are those which act from without, e.g., irritating substances like tobacco snuff and dust. Intrinsic causes occur in association with such systemic diseases as hay fever, asthma, whooping cough, hysteria, derangement of the sexual functions, and gout. Sneezing may occur as a reflex from the external auditory canal as a result of collections of ear wax. See ASTHMA; CORYZA; HAY FEVER.

**SNEFRU**, or SNOFRU. The name of the first King of the fourth Egyptian dynasty. He reigned about 3000 B.C. and was the immediate predecessor of Cheops (q.v.). Snefru opened mines for copper and malachite at Wadi Maghara in the Sinaitic Peninsula, and on a rock tablet at this place the King is depicted in the act of slaying an enemy. Later accounts state that he defended Egypt from an invasion of Asiatic tribes. The tomb of Snefru is the so-called step pyramid of Medum (q.v.). Consult: K. A. Wiedemann, *Ägyptische Geschichte* (Gotha, 1884-88); E. A. T. Wallis Budge, *History of Egypt* (8 vols., Chicago, 1902); W. M. Flinders Petrie, *A History of Egypt* (6 vols., New York, 1905); J. H. Breasted, *A History of the Ancient Egyptians* (ib., 1908); id., *Ancient Records of Egypt*, vol. i (Chicago, 1906); W. M. Flinders Petrie and others, "Meydum and Memphis (III)," in *Publications of the Egyptian Research Account*, 18 (London, 1910).

**SNEHATTEN**, snā'hāt'tan (Norw., snow cap). The highest peak of the Dovrefjeld in Norway, 80 miles southwest of Trondhjem (Map: Norway, D 5). Its altitude is 7615 feet.

**SNELL**, HENRY BAYLEY (1858- ). An American landscape painter. He was born at Richmond, London, and studied at the Art Students' League, New York. Characteristic examples of his landscapes, which interpret nature in her gentler moods and are rendered with finely modulated color and charming tonal qualities, include: "The Citadel at Quebec" (Albright Art Gallery, Buffalo); "Entrance to the Harbor of Polperro" (Worcester Museum); "Night-Fall" (Art Association, Indianapolis); "Low Tide" (1907); "Lake Como" (Metropolitan Museum, New York); "The Harbor Light" (1913). In 1906 he was elected a member of the National Academy; he became president of the New York Water Color Club and received, among other medals and prizes, a gold medal at the Penn-

sylvania Art Club in 1896. His wife, FLORENCE FRANCIS SNELL, became known as a decorative landscape painter.

**SNELLEN**, snĕl'en, HERMAN (1834-1908). A Dutch ophthalmologist. He was born at Zeyst and studied medicine at Utrecht (M.D., 1857), where he was professor of ophthalmology from 1877 to 1899. He is best known as the originator of Snellen's test types for examination of the organ of sight, based upon physical and physiological methods, described in his *Optotypi ad Visum Determinandum* (1862; 20th ed., 1911). He was a prolific writer.

**SNELLIUS**, WILLERD (1591-1626). A Dutch mathematician and astronomer. He was born and educated at Leyden and succeeded his father as professor of mathematics there. Snellius discovered the law of refraction of light (1619) and the properties of polar spherical triangles and gave a scientific method for measuring the arc of a meridian. His chief works are *Eratosthenes Batavus* (1617) and *Cyclo-metrica* (1621).

**SNIDER**, DENTON JAKUES (1841- ). An American author. He was born at Mount Gilead, Ohio, and graduated at Oberlin College in 1862. Soon afterward he became a lecturer on literary subjects. He made his home in St. Louis. His writings include: *Commentaries on the Literary Bibles* (9 vols.: 3 on Shakespeare and 2 each on Goethe, Dante, and Homer, 1877-93); *Walk in Hellas* (1882); *The Freeburgers* (1889), a novel; *World's Fair Studies* (1895); *The Will and its World* (1899); *The Psychology of Froebel's Play-Gifts* (1900); *Social Institutions* (1901); *The State* (1902); *Modern European Philosophy* (1904); *A Tour in Europe* (1907); *Cosmos and Diacosmos* (1909). Among his poetical publications are: *Delphic Days* (1878); *Agamemnon's Daughter* (1885); *Homer in Chios* (1891); *Johnny Appleseed's Rhymes* (1894).

**SNIDER**, JACOB (?-1866). An American inventor. In 1859 he went to England, where he endeavored to secure the adoption by the British government of a system of breechloading or converting rifles. But although he succeeded in securing its introduction he was unable to obtain adequate remuneration and died without having received the reward of his labors.

**SNIPE** (Icel. *snipa*, snipe). A small limicoline marsh bird of the family Scolopacidae and genus *Gallinago*, having a very long straight bill, with nasal grooves extending almost to the tip, which expands a little and is soft and very sensitive, smooth, and shining in the living bird, but soon after death becomes pitted like the end of a thimble by drying. The tip of the bill is filled with the terminals of the nerve fibres (for which consult Yarrell, *British Birds*, 4th ed., London, 1884). The head is compressed; the eyes are large and placed far back in the head. The feet have three toes before, divided to the base or very nearly so, not edged by membrane; the hind toe is short. The tail is short and contains 14 to 16 feathers.

The common snipe of Europe (*Gallinago gallinago*) is about 11 inches in entire length, the bill almost 3 inches. The sexes are alike in plumage, but the female is rather larger than the male. The general color of the upper parts is blackish brown, finely mixed with pale brown and buff; three pale brown streaks along the head are characteristic of the whole genus. The neck and breast are pale rust color mottled with

black; the belly is white. It makes a rude nest of a little dry herbage in a depression of the ground or sometimes in a tuft of grass or rushes. The eggs are four in number, pale yellowish or greenish white, the larger end spotted with brown. North America has but a single species of *Gallinago*. The common American or Wilson's snipe (*Gallinago delicata*) is about equal in size to the common snipe of Europe and much resembles it also in plumage. This species is abundant in summer in northern parts of the United States and in Canada, in the more southern States in winter. The peculiar cry of this bird, "scape-scape," and its twisting motion in flight are highly characteristic; and in spring it circles about in the air near its nest with a queer zigzag flight, uttering a curious drumming or "bleating" noise. Consult: J. L. Bonhote, *Birds of Britain* (London, 1907); W. H. Rich, *Feathered Game of the Northeast* (New York, 1907), and general ornithologies. See Colored Plate of SHORE BIRDS, and Colored Plate of GAME BIRDS, with article GROUSE.

**SNIPE EEL** (so called from the long jaws). One of a group of little-known, extremely slender eels forming the family Nemichthidae. Many of them live in the ocean depths, the one illustrated on the Plate of EELS, CONGERS, and MORAYS (see EEL) belonging to the Gulf Stream. The best-known species is *Nemichthys scolopaceus*, common in rather deep water in the North Atlantic.

**SNIPEFISH** (so called from the long snout). A fish of the related hemibranch families Fistulariidae and Macrorhamphosidae, allied to the pipefish and variously known as trumpet fish, bellows fish, flutemouth, etc. Specifically the term usually refers to a small species of the south European coast, occasionally straying to America (*Macrorhamphus scolopax*), remarkable for the conformation of the head, the skull being elongated into a tube, at the extremity of which are the mouth and jaws. Some related species of tropical waters become from 4 to 6 feet in length.

**SNIPE FLY**. Any one of the small slender flies of the family Leptidae. They have long legs and slender bodies and are predatory, destroying other insects. Generally they have smoky wings and velvety bodies. They are sluggish in habits. The larvæ are found in water, decaying wood, earth, moss, dry sand, and in the burrows of wood-boring beetles. More than 50 species occur in the United States.

**SNOFRU**. See SNEFRU.

**SNOHOMISH**. See SALISHAN STOCK.

**SNOILSKY**, snoil'skĕ, KARL JOHAN GUSTAF, COUNT (1841-1903). A Swedish poet, born in Stockholm and educated at Upsala University. He entered the diplomatic service in 1865 and held various secretarial posts until 1879, when he abandoned diplomacy for literature. His works include: *Oorchideer* (1862); *Dikter* (1869; 4th ed., 1883); *Nya dikter* (1881); *Dikter: 3e Samlingen* (1883); *Dikter: 4e Samlingen* (1887); *Dikter: 5e Samlingen* (1897). He also published in 1876 a translation of Goethe's ballads. His *Samlade dikter* were published in 1903-04 in five volumes.

**SNOOK** (from Dutch *snoek*, pike, jack). A fish. 1. A barracouta (q.v.) of Australian and South African waters (*Thyrstites altun*), important as a food fish. 2. The robalo (q.v.).

**SNOQUALUM**, snô-kwôl'um. See SALISHAN STOCK.

**SNORRI STURLUSON**, snór'ré stóor'ly-sún (1178-1241). An Icelandic historian and statesman, remembered as the author of the *Heimskringla* (annals of old Norwegian kings) and of the *Younger* or *Prose Edda*. Snorri, youngest son of a local chieftain, was a follower of the chief Jon Loptsson. He became a poet and lawyer and in 1215 was head of the Legislative Assembly and the highest court. King Haakon invited him to Norway in 1218, and later he negotiated a peace between Norway and Iceland. He returned to Iceland, where he used his power to his own advantage, and in 1239 political and domestic intrigue compelled his flight to Norway. He returned in 1240 and in 1241, by King Haakon's orders, was killed by Gissur, Snorri's son-in-law. The *Prose Edda*, finished in 1222, comprises the mythological *Gylfaginning*, the *Skáldskaparmál*, a sort of *Ars Poetica*, and the *Háttatal*, a commentary in 102 strophes on poems in honor of the author's Norwegian patrons, King Haakon and his tutor Skuli. The *Sagas* extend from the mythological kings to 1177 and are based on chronicles, tradition, and legend. They show great literary ability. The *Olaf Saga* he also elaborated separately. Snorri's *Heimskringla* has been edited by Peringskjöld (2 vols., Stockholm, 1097); Schöning and Thorlacius (6 vols., Copenhagen, 1777-1826); Unger (Christiania, 1868); and best by Finnur Jónson (Copenhagen, 1893-1901; and in briefer form, 1911). There are translations into Danish by Grundtvig (Copenhagen, 1818-22); Norwegian by Aall (Christiania, 1838-39) and Gustav Storm (ib., 1900); Landsmaal by Schjött (ib., 1900); Swedish by Richert (Stockholm, 1816-29) and H. Hildebrand (Orebro, 1889); German by Wachter (incomplete, Leipzig, 1835-36); and English by Laing (London, 1889 and 1906), M. Morris (ib., 1893-95, 1905), Anderson (New York, 1906).

**SNOUCK HURGRONJE**, snuk hur-grón'ye, CHRISTIAAN (1857- ). A Dutch Orientalist, born in Oosterhout, North Brabant, and educated at Leyden, where he studied Arabic under De Goeje, and at Strassburg under Nöldeke. He taught Mohammedan law at Leyden in the civil-service college for the Dutch Indian service and in 1884 traveled in Arabia. Disguised as a native doctor of the civil law, he spent almost a year in Mecca. In 1888 he was sent on a governmental scientific expedition in the Dutch Indies and soon afterward settled in Java, where he assumed an official post as adviser to the Dutch Governor-General of Batavia. In 1907 he returned to Leyden as professor of Arabic. Among his works are: *Het Mekkaansche Feest* (1880), a doctoral thesis; *Mekka* (1888-89), with an atlas; *Bilder aus Mekka* (1889); *De beteekenis van den Islam voor zijne belijders in Oost-Indië* (1883); *Der Uahdi* (1885); "De Islam," in *De Gids* (1886); *De Atjehers* (1894); *Het Gajoland en zijne bewoners* (1903); *Arabië en Oost-Indië* (1907); *Nederland en de Islâm* (1911).

**SNOUT BEETLE.** A weevil. See **WEEVIL**.

**SNOW** (AS. *snāw*, snow). Minute crystals of ice formed in the atmosphere when the aqueous vapor is condensed at temperatures below freezing. These crystals usually combine into groups, sometimes large and flocculent, but often small and arranged with great regularity. The elementary ice crystals or spiculæ are prisms of six sides whose ends are perpendicular to their lengths. When the length of the crystal

is very small as compared with its diameter, these needles become thin flat plates. The early meteorological observers have recorded the figures of snow crystals, as observed under a magnifying glass, but later observers have secured photographs of the crystals as seen through the compound microscope. The longer rays that constitute the arms of the six-rayed stars are generally hollow tubes; they are evidently built up by additions to the edge of an original crystal.

The white color of snow results from the fact that the snow crystals are so minute that each cell of the retina receives a general impression produced by the combination of different wave lengths reflected from innumerable minute facets. Red snow, and more rarely other colors, such as green, blue, or black snow, are produced by the action of innumerable fungi known as the *Micrococcus nivalis*. Red snow has been photographed in natural colors. (Consult F. A. Carpenter, in *Transactions of the San Diego Society of Natural History*, 1911, vol. i, p. 108.) Snow rarely falls at sea level south of the parallel of lat. 30° N., and on the Pacific coast of North America it occurs at sea level only north of lat. 47° N.

**Measurement of Snowfall.** Snow is even more difficult to measure than rain. (See **RAIN GAUGE**.) The action of the wind interferes with the falling snowflakes as they are about to enter a snow gauge exposed to collect them, or drives them out after having entered. Even moderate winds often remove the snow cover from the ground in some places and heap deep drifts of snow in others. It is the ordinary custom to state the quantity of snowfall as so much depth

FIG. 1. MARVIN SNOW-DENSITY BUCKET, WEIGHING SCALES, AND MEASURING STICK.

The pail is carefully filled to the brim with the snow to be measured. The density indicated is 22%, the pail full of water weighs 100 units. The measuring stick is divided to tenths of inches.

(inches or other unit) of the newly fallen layer, or, better, the depth of the layer of water that would result if the snow were melted in place.

Snow, when melting or mixed with rain, must be collected in a suitable gauge for satisfactory measurement. Such gauges must be freely exposed, but sheltered from strong winds and provided with appropriate wind shields which cut off or diminish the eddy actions of the wind playing around the mouth of the gauge. (See Fig. 3.) The quantity of snow collected in any

FIG. 2. SNOW STAKE, UNITED STATES WEATHER BUREAU PATTERN.

gauge is most conveniently measured by weighing, but it is often determined by measuring the volume of water obtained by melting the snow. When the snow is relatively "dry," the quantity may be satisfactorily determined by measuring the depth of the freshly fallen layer in some spot unaffected by drifting. Obviously this method fails to indicate the entire precipitation if the snow is melting or is mixed with rain. There are two methods for measuring freshly fallen snow in such cases. One way is to cut out a representative section of the snow layer, melt it, and measure as if the layer had been water. The other way is to measure the density of the snow (relative to water) and multiply this by the average depth of the layer in inches as found by one or several representative measurements. (See Fig. 1.)

Certain engineering and meteorological demands call for the careful determination of the water equivalent of the whole layer of snow on the ground. This information is particularly important in mountainous regions constituting the headwaters of important rivers or streams used for power and irrigation purposes. For this purpose one employs appropriate sampling tubes, 50 or 60 inches long and 2 or more inches in diameter. The tube is forced completely through the snow to the ground. The water equivalent of the core or sample of snow is then determined either by weighing the tube and core together or by removing the snow to a separate container for weighing. The snow in deep beds is often found, at the opening of spring, to have a density as high as 30 to 50 per cent.

In remote and relatively inaccessible regions as well as elsewhere the Weather Bureau sets up so-called snow stakes by means of which the depth of the whole layer of snow is approximately determined and reported from time to time. (See Fig. 2.) A Weather Bureau shielded snow gauge exposed in a mountainous country is shown in Fig. 3.

The great accumulations of snow, by sliding downward in ravines until they join together in the river valleys and form glaciers (q.v.), constitute an important factor in the study of physical geography. A heavy snowfall is not merely

a question of low temperature, but of inflowing and uprising cool moist air. In this respect the physical processes that determine the formation of snow are entirely similar to those that determine the formation of rain. The ordinary limits of snowfall and glaciation at sea level are north of the parallel of  $30^{\circ}$  N. and south of the parallel of  $30^{\circ}$  S. Snow is an exceedingly poor conductor of heat, owing to the nonhomogeneous texture of the mass, which may be considered as composed of alternate thin layers of ice and air. A covering of snow on the ground or a hut hastily built of blocks of snow is a very good protection against the cold storms from the north. The roots of the most tender vegetation prosper under a covering of snow, which ordinarily conserves the heat brought to the surface by conduction from warmer layers below and allows the soil to have a higher temperature than without the snow blanket.

From an agricultural and a geological point of view the amount of snow lying on the ground at any time is highly important. The United States Weather Bureau publishes weekly and monthly maps showing this feature of climatology; a general map has also been compiled

FIG. 3. MARVIN SHIELDED SNOW GAUGE, AS USED BY THE WEATHER BUREAU.

The cylindrical vessel in the centre of the trumpet-shaped wind shields collects the snow, whose quantity is found by weighing the receptacle.

showing the normal amount of snowfall for the whole year as a help towards the study of the climatic conditions that attend the accumulation of snow.

**Bibliography.** The principal collection of snow photographs are those that we owe to Dr. Neuhass, of Berlin (1892-93); G. Norden-skiold, of Stockholm; A. A. Sigson, of Rybinsk, Russia; and, most important of all, those of W. A. Bentley, of Jericho, Vt. Consult articles in *Appleton's Popular Science Monthly* (New York, May, 1898); in the United States Weather Bureau, *Monthly Weather Review* (Washington, May, 1901), and the annual summary for 1902; also *Snow and Ice Bulletin* (ib., weekly).

SNOW

PHOTOMICROGRAPHS OF SNOW CRYSTALS SHOWING TYPICAL FORMS  
Photographed by W. A. Bentley, Jericho, Vt.

**SNOW, LORENZO** (1814-1901). An American Mormon leader, born at Mantua, Portage Co., Ohio. He studied at Oberlin College, in 1836 was converted to Mormonism, and in 1840 was a missionary to Great Britain. He was sent on missions to Italy in 1849 and to the Sandwich Islands in 1864. In 1852 he was elected to the Utah House of Representatives, and until 1882 he continued to be a member of either the House or the Council. Snow established the city of Brigham (Utah) in 1855, and there he organized a system of coöperative industry. In 1889 he was elected president of the Twelve Apostles and in 1898 president of the Mormon church. His publications include a translation of the *Book of Mormon* into Italian; *The Only Way to be Saved* (1851); *The Italian Mission* (1851); *The Voice of Joseph* (1852).

**SNOWBALL TREE.** Another name for the guelder-rose (q.v.).

**SNOWBERRY** (*Symphoricarpos racemosus*). A bushy deciduous shrub of the family Caprifoliaceæ, a native of northern North America and common in shrubberies. It has simple leaves, small flowers, white inedible berries, about the size of black currants, remaining on the bush after the leaves. There are about 10 species. The creeping snowberry (*Chiogenes hispida*) is a native of North American bogs.

**SNOW'BIRD.** Any species of bird, usually a finch, associated with snow. In the United States the name is most commonly applied to the junco (q.v.), but also to the snow bunting (q.v.). See Plate of SPARROWS.

**SNOW BUNTING, or SNOWFLAKE.** A large finch (*Passerina*, or *Plectrophenax, nivalis*) of a genus distinguished by the long larklike straight claw of the hind toe and a similarity to the larks in habits; there is a similar ease and celerity in running along the ground, and the song is very different from that of any of the true buntings. The color of the plumage is very different from most fringilline birds, for white predominates. In summer plumage the back and parts of the wings and tail are black. In winter plumage all the upper parts are rusty brown. The length of an adult is 7 inches. The snow bunting abounds in summer in all parts of the Arctic regions, and in winter migrates into the north-temperate regions, but is rarely seen, even in the northern United States, except in severe winters and when snow is plentiful. It feeds largely on the seeds of grasses and weeds and is often seen in company with longspurs (q.v.). See Plate of BUNTINGS AND GROSBILLS.

**SNOW COCK.** A name given by Anglo-Indian sportsmen to two different birds found near the snow line in the Himalaya. One is the Tibetan snow pheasant, a large and active species frequenting the stony heights of all Central Asia. It is *Tetraogallus himalayensis* and lives at elevations of from 11,000 to 18,000 feet. They feed in flocks and always have a sentinel perched on some projecting boulder to give the alarm in case of danger. The golden eagle is their greatest enemy. (For the most complete account, consult Hume and Marshall, *The Game Birds of India, Burma, and Ceylon*, vol. i, Calcutta, 1879.) Other species are found in various other Asiatic mountain ranges. Another snow cock is the jer-monah (*Lerwa nivicola*) of the higher Himalaya and western China.

**SNOWDEN, snô'd'n, JAMES ROSS** (1810-78). An American numismatist, born at Chester, Pa.

After graduating at Dickinson College he settled in Franklin. Subsequently he was State Treasurer (1845-47), Treasurer of the United States Mint (1847-50), and its director (1853-61). His publications include many pamphlets on coins and his *Description of Coins in the United States Mint* (1860); *The Mint at Philadelphia* (1861); *Coins of the Bible* (1864).

**SNOWDEN, PHILIP** (1864- ). An English Socialist and labor leader. He was born at Keighley, Yorkshire, and was educated at a board school and privately. He entered the civil service in 1886, but retired in 1893 to take up journalism and lecturing. Entering politics as a member of the Labor party, he was elected a member of the House of Commons in 1900. He was chairman of the Independent Labor party in 1903-06 and was appointed a member of the Royal Commission on Canals and Waterways and of the Royal Commission on the Civil Service. He wrote much on Socialistic and political subjects, including *Socialism and Syndicalism* (1915).

His wife, ETHEL SNOWDEN, became known as the leader of the English nonmilitant woman suffragists. She visited the United States in 1915 to attend the Women's Peace Conference at San Francisco. Consult A. G. Gardiner, *Prophets, Priests, and Kings* (new ed., London, 1914).

**SNOWDON, snô'don.** A mountain group in Carnarvonshire, North Wales (Map: Wales, C 3). It is broken by valleys into four minor groups, whose chief peak, Moel-y-Wyddfa (the conspicuous peak), is the highest mountain in South Britain, being 3590 feet above sea level.

**SNOW'DROP** (so called from the color of the flower), *Galanthus*. A genus of plants of the family Amaryllidaceæ. The bulbous root produces two leaves and one single-flowered leafless stem. The common snowdrop (*Galanthus nivalis*) is found chiefly in the woods and pastures of southern Europe. Various species are popular spring flowers in flower gardens.

**SNOWDROP TREE, or SILVER-BELL TREE,** also known as OPOSSUM WOOD (*Halesia carolina* and *Halesia diptera*). Two shrubs or small trees of the family Styacaceæ, with large and veiny pointed deciduous leaves and showy white flowers, drooping on slender pedicels in short racemes or clusters from axillary buds of the preceding year. They are beautiful shrubs for cultivation.

**SNOW FENCES and SNOW SHEDS.** See RAILWAYS.

**SNOWFLAKE** (from the color of the flower), *Leucojum*. A genus of 9 or 10 species of bulbous herbs of the family Amaryllidaceæ, natives of the Mediterranean region. The spring snowflake (*Leucojum vernum*), the best-known species, produces umbels of sweet-scented flowers

SNOWDROP TREE (*Halesia carolina*).

in March or April. The summer snowflake (*Leucojum aestivum*) is a beautiful, rapidly growing plant. *Leucojum autumnale*, a Portuguese species, produces drooping flowers in autumn. These plants make the best growth on rich sandy or loamy soils. Propagation is by offsets, obtained as soon as the leaves have become dry.

SUMMER SNOWFLAKE.

toothed, is pink and the feet reddish. An adult male measures 27 inches long and weighs  $5\frac{1}{4}$  pounds. Ross's snow goose (*Oen rossii*) is a miniature of the other and is known all over the Hudson Bay country as horned wavy. Consult Elliott Coues, *Birds of the Northwest* (Washington, 1874), and W. H. Rich, *Feathered Game of the Northeast* (New York, 1907).

**SNOW LEOPARD.** The ounce (q.v.).

**SNOW LINE.** The level on a mountain slope above which snow exists all the year round or at least very nearly so. The height of this line above sea level varies greatly both from year to year and in different localities; it moves up and down within a broad zone and is determined principally by the direction of the slope, the temperature, moisture, and average velocity of the prevailing winds. The average height of the snow line is about 18,400 feet in the tropical Andes, 19,000 in the Himalaya, 6000 in Patagonia, 2000 in Greenland. See SNOW; MOUNTAIN; and articles on the separate mountain ranges, ALPS, HIMALAYA, ETC.

**SNOW-ON-THE-MOUNTAIN.** A euphorbiaceous plant. See SPURGE.

**SNOW PLOW.** A machine for clearing roads and railways of snow. The rotary steam snow shovel has been adopted by all the transcontinental lines of the United States and Canada. It consists of a wheel, 9 feet in diameter, set in a round casing with a flaring front, 10 feet square, which feeds the snow into the wheel. The wheel contains an inner and outer series of knives pivoted on radial pins, with their surfaces inclined to one another; when they encounter any snow they are canted, or set so as to slice it off and feed it into the machine. Behind the knives is a fan wheel composed of a number of radial blades. When the wheel revolves the centrifugal force throws the snow to the outside of the wheel; it meets the inclosing case and is forced through an opening behind the headlight. A hood here regulates the direction in which the snow is thrown. The machine weighs about 20 tons.

**SNOWSHOEING.** Snowshoes are of four

permanent main varieties. One is long and narrow and sharp at each end, swelling only slightly in the middle, and slightly turned up at the toe. Another has a turned-up entry, which meets the snow nearly squarely, and a trailing pointed after end. These are favorite patterns in the north; they are about 5 feet long, 1 foot wide in the centre, made of hickory or some other tough wood which will bend without breaking, and laced with fine caribou-skin webbing, except just under the foot, where there is an open bed cording of thick rawhide. A third kind is broader and shorter, with an oval entry at the fore end and a trailing, shorter after end. The fourth set are almost circular, with a stumpy beaver-like trail end.

In walking the shoe is slightly raised and carried partly over and ahead of its fellow, and when the step is completed the swell of the centre of the frame of the rear shoe lies close to the inward curve of the hinder part of the leading shoe. The principal snowshoe clubs of Canada are those of Montreal and Quebec. The time record for snowshoeing is faster than the ordinary cross-country runs. The hundred-yard dash takes a little over 12 seconds; the mile, 5 minutes 40 seconds.

**SNOWY OWL.** A large owl (*Nyctea nyctea*) which inhabits the circumpolar region and appears irregularly in winter in more temperate regions southward. It has no horns, and the male is sometimes almost immaculately white, while the female is barred more or less heavily with dark-brownish slate. Its habits are similar to those of other large owls (q.v.), except that it usually nests on the open ground of the tundra, on the side of a hill or near some projecting boulder. It lays 5 to 10 round white eggs. In Arctic America it feeds mainly upon ptarmigan, lemmings, and ducks.

**SNUFF.** See TOBACCO.

**SNUFF TAKERS.** See CONSCIENCE WHIGS.

**SNY'DERS, FRANS (1579-1657).** A Flemish animal and still-life painter. He was born at Antwerp and studied under Pieter Brueghel the Younger and Hendrick van Balen, joined the Painters' Guild in 1602, and after a journey to Italy settled in Antwerp in 1609. His talents won for him the admiration of Rubens, who frequently engaged him to paint fruit, game, and other accessories in his pictures; in turn Rubens, Jan Bockhorst, and occasionally Van Dyck often contributed the figures to the canvases of Snyders. As a painter of hunting episodes, scenes of violent action, and combats of animals, Snyders stands as very nearly the equal of Rubens in breadth and vigor of execution, and in richness of composition; though inferior to Rubens as a colorist. His pictures are seen in all the famous galleries of Europe, that of Madrid possessing 22. There are five in the Stockholm Museum; 14 at the Hermitage, St. Petersburg, mostly still-life; six at Dresden; and six at Munich, including his masterpiece, "Two Lions Pursuing a Roebuck." A subject similar to the last named is in the Metropolitan Museum, New York.

**SOANE, sön, SIR JOHN (1753-1837).** An English architect, born at White Church, near Reading. In 1788 he was appointed architect to the Bank of England, which remains the best example of his work. He was elected to the Royal Academy in 1802 and became professor of architecture there in 1806. While lecturing he began the Soane Museum, which

he presented to the British nation with an endowment. It contains a valuable collection of pictures, casts, and antiquities. His written works include *Designs for Public Improvements in London and Westminster* (1827) and *Designs for Public and Private Buildings* (1828).

**SOAP** (AS. *sāpe*). A term generally employed in chemistry to describe the metallic salts of the higher fatty acids. In commerce it has a more limited application, being confined to the water-soluble potassium and sodium soaps and to the water-insoluble salts of such heavy metals as lead, magnesium, and aluminium. The former are extensively used as detergents and also in a limited way as bases for various dyestuffs and sometimes for medical purposes. The sodium compounds of fatty acids, being generally efflorescent, harden on exposure to air and hence are known as hard soaps. But the potassium compounds absorb water under the same conditions and consequently tend to liquefy and are called soft soaps.

The fats generally used in soap making include tallow and greases of animal origin, lard oil, palm oil, olive oil, cottonseed oil, corn oil, coconut oil, stearin, red oil (crude oleic acid), etc. The alkali lyes are prepared by dissolving caustic soda or potash in water to the desired strength, or (more often the case in large establishments, at least with the caustic-soda lyes), they are made by dissolving carbonate of soda in hot water and then adding the requisite quantity of quicklime for causticizing, boiling and allowing the mass to cool, when the clear lye is drawn from the top. The solution obtained is often strengthened by evaporation or by addition of more solid caustic alkali.

The soaps manufactured at present may be classified as follows: (1) rosin or laundry, settled soaps; (2) toilet soaps, including settled, half-boiled, transparent, and floating varieties; (3) marine soaps; (4) medicated soaps; and (5) manufacturing soaps.

The materials required in manufacturing settled soaps include tallow (alone or mixed with grease and oil), caustic-soda solution (18°–22° Baumé), and pickle (saturated salt solution). The operation is carried out in large sheet-iron kettles, circular or square, heated by two steam coils lying on the bottom of the kettle. One coil is perforated with small holes and delivers free steam in fine jets (the open coil); the other serves to heat the contents of the kettle, but allows no escape of steam (the closed coil). The various operations are known as stock change, rosin change, strength change, and finish-stock change. The stock (i.e., the fatty material) is pumped in liquid state into the kettle, and partly spent lye from a previous operation is added, the open coil being used as a heater. A portion of the stock being always somewhat rancid, it unites at once with the lye to form soap, the soap in turn, with the aid of the live steam, emulsifying the rest of the fat. The open coil is now shut and the closed coil used. From time to time strong fresh lye is added, until the contents of the kettle are homogeneous, have a characteristic gummy appearance, and run in long strings from a wooden paddle dipped in the hot liquid. Pickle is then added, until the soap becomes insoluble (grained) and floats on the surface. The contents of the kettle, on cooling, separate into two layers, the granular imperfect soap

floating on the brine. The latter, which contains a certain amount of glycerin, is drawn from the bottom of the kettle and worked for glycerin and salt.

To the soap remaining is added fresh strong lye and rosin to the amount of 50 to 100 per cent of the stock originally used. This mixture is heated by the closed coil until the rosin is saponified, and then the kettle is salted out as before. This completes the rosin change. On standing, a lye separates which contains a little glycerin not extracted in the previous process; this lye, too, is worked for glycerin and salt. The next operation (the strength change) is introduced in order to insure complete saponification. For this purpose fresh strong lye (at least 22° Baumé) is added and the mass kept gently boiling for several hours in the grained condition, strong lye having the same effect on soap as pickle—it renders the soap insoluble. At the conclusion of this operation the kettle contents are allowed to cool and settle, and the drawn-off lye, which is not exhausted as in the previous operations, is used to start a new saponification in the stock change. The grained soap is finally reheated and enough cold water added to cause it to pass into solution (close). At this stage the heat is turned off, and the kettle contents slowly cool down and stratify in three layers—the pure soap on top, next an impure dark soap called *negre*, and finally a small quantity of strong dark lye too impure for further use. The process of making settled soap without rosin is the same, except that the rosin-change operation is left out. Many soapmakers use very small quantities of rosin in making toilet soaps, believing that this tends to “pitch the *negre*,” i.e., clarify the product.

Rosin soap is allowed to cool in the kettle to about 65° C. (150° F.) and then run into the crutcher, a horizontal iron cylinder provided with a shaft bearing paddle blades. These revolve and thoroughly mix the soap, yielding a product uniform in texture and color. In this operation it is customary to make various additions—carbonate of soda to soften hard water, silicate of soda to harden the soap and prevent too rapid wasting, and other substances, some of doubtful utility. After crutching the warm mixture is run into large iron frames or molds and cooled. When the soap is hard the sides of the frame are removed and the soap is cut into slabs and bars with a steel wire. After a short drying operation the soap is pressed and ready for use. An ordinary rosin soap freshly made has the following composition:

Fatty and rosin acids.....	66.24 per cent
Free alkali.....	0.36 per cent
Combined alkali.....	6.82 per cent
Water.....	28.00 per cent

Settled toilet soap is not crutched, but run at once into frames. When hard the soap is cut by wires into thin bars, which are dried on racks in a warm well-ventilated room, and when the moisture is reduced to about 10 per cent the slabs are cut into fine thin chips or shavings and dried once more. The required perfume and coloring matter having been added, the chips are fed into a roller mill, coming out in thin *crêpelike* sheets. These are passed through again and again until the mass is homogeneous. The thin sheets then pass into the plotter, a revolving screw press which is

gently heated and delivers the soap in long slender bars. The bars are cut into short lengths and pressed into cakes by suitable dies. Often settled and half-boiled soaps are mixed in the mills, but, as a rule, the finer toilet soaps are made exclusively from settled soap, entirely free from glycerin. Since 1910 the saponification of fats has been carried on with lime, or a mixture of lime and soda, resulting in a lime or lime soda soap and an increased yield of glycerin. The resulting soap is subsequently decomposed by boiling with soda ash lye ( $\text{Na}_2\text{CO}_3$ ) and yields an excellent quality of soda soap and an insoluble residue of calcium carbonate.

Half-boiled soap is an evident misnomer, no higher temperature than that necessary to melt the fatty materials ( $50^\circ\text{--}65^\circ\text{C.} = 120^\circ\text{--}150^\circ\text{F.}$ ) being used in the process. The operation is usually carried out in small cast-iron jacketed kettles, in which the fat, which must be of good quality and usually consists of tallow or tallow and coconut oil, is liquefied by heat. An exactly calculated quantity of strong lye ( $36^\circ\text{--}40^\circ\text{Baumé}$ ), consisting of soda alone or mixed with a small amount of potash, is now gradually added and the mass vigorously stirred with a wooden paddle. When emulsification is complete and saponification is well under way, the mass is ladled into an iron frame and allowed to stand for several days, during which time the fatty matter is completely saponified, cools down to the normal temperature, and hardens. The frame may now be stripped and the soap cut and pressed in the usual manner.

Transparent soaps are made by remelting half-boiled soaps with the addition of a small quantity of alcohol, some additional glycerin and cane sugar or glucose. This operation leaves the soap as a transparent jelly-like mass, which is cut up and allowed to stand until the alcohol has evaporated. The bars are then planed down, again cut, and pressed into any desired shape. Of late years it has been the custom of various manufacturers to introduce some form of saponified rosin into this class of soaps to increase lathering quality.

Floating soaps were originally made wholly from coconut oil. Now such soaps are extensively made by incorporating with the soft warm mass of any soap enough air to reduce the specific gravity below that of water, the operation being usually conducted in a jacketed kettle provided with a screw stirrer. As a rule, floating soap is made from a mixture of tallow and coconut oil, which is half boiled, with mixed potash and soda.

*Marine or salt-water soap* is a half-boiled mixture made from pure coconut oil, with potash and soda lye and an addition of salt and carbonate of soda. The United States navy specifications call for a soap of the following composition: the fatty matter shall consist of pure coconut oil only; water should not be present to an extent of more than 55 per cent; and free alkali ( $\text{NaOH}$ ) shall not exceed 0.5 per cent; carbonated alkali ( $\text{Na}_2\text{CO}_3$ ) may be present in quantities varying between 2 and 3 per cent; foreign mineral matter should not exceed 0.5 per cent. Such a soap will wash freely in salt or fresh water because of the solubility of the alkali salts of lauric acid (a fatty acid present in coconut oil) in solution of salt. This soap does not keep well, decomposition of the salts taking place during drying, which liberates free fatty acid and makes the soap rancid.

Soaps made from olive oil with soda or mixed potash by the half-boiled process are known as Castile soap, a recognized standard. Such soaps are often adulterated with cottonseed oil.

Marseilles soap is a settled olive-oil soap made with rather more soda than necessary for saponification and then boiled down until the excess lye is strong enough to cause a precipitation of the soap. The mottled varieties receive an addition of copperas solution before boiling down. During the long-continued boiling operation the iron partially oxidizes and remains suspended in the hot mass, producing the characteristic blue, green, or red mottling.

Soft potash soaps are now rarely made, the soft soaps found in the market being soda soaps that contain an excess of water.

Naphtha soaps consist of mixtures of soda soaps with or without rosin and kerosene or some similar grade of hydrocarbon. They are usually quite alkaline, due to the sodium carbonate necessary for holding the hydrocarbon in the mixture.

Medicated soaps are merely mixtures of pure neutral soaps with various remedial agents or with carbolic acid, formaldehyde, etc. The term "antiseptic soap" is misleading, a pure settled soap being aseptic by itself and hardly anything being capable of improving this quality. Pure olive-oil soap is used in medicine both internally and externally. It may be used as a laxative in the form of pills or as an enema in children for the same purpose or a plug of soap may be inserted in the rectum. Soap is also valuable as an emergency remedy in poisoning by the mineral acids. Externally soap is valuable as a stimulating liniment in psoriasis, lichen, eczema, and other chronic affections of the skin.

Manufacturing soaps, such as the wool and silk scouring soap, consist of neutral compounds of olive or lard oil with potash. It is very essential that these soaps should be neutral and freely soluble. A strongly alkaline soap would injure the delicate fibre and at the same time not prove so efficient a detergent. Other special soaps for textile purposes have benzene, carbon tetrachloride, etc., incorporated in them, often in the form of an emulsion. They are used for dry cleaning.

The most important of the water-insoluble soaps (soaps or salts of the alkaline earths and heavy metals) are aluminium soaps, used in waterproofing compositions and in leather substitutes; and lead, zinc, iron, nickel, cobalt, and chromium soaps, used in paints, colored varnishes, and as driers.

**Theories of the Detersive Action of Soaps.** Berzelius' theory formulates the dissociation and subsequent formation of an acid soap which forms the suds and free alkali uniting with any greasy matter present. This is the generally accepted theory to-day. On the other hand Rotondi, who made a careful experimental investigation of the subject, maintained that soaps decompose in solution, not into acid soaps and free alkali, but into acid soaps and basic soaps, the latter being precipitated from solution by common salt without losing any alkali, while acid soaps are completely soluble in hot solutions of basic soaps. The basic soaps, according to Rotondi, have the power to emulsify, but not to saponify (unite chemically) with fatty bodies, and it is to this emulsifying power that the detergent value of soaps is due. Recent

experiments conducted with fabrics impregnated with emulsifiable but not saponifiable materials, such as kerosene oil, seem to confirm Rotondi's opinions. Soap also cleanses by reducing surface tension and so concentrating on surfaces that adhering particles are removed. See FATS; LAURIC ACID; OIL; OLEIC ACID; OLEIN; PALMITIC ACID; PALMITIN; STEARIC ACID; STEARIN; ETC.

Sadtler, *Industrial Organic Chemistry* (4th ed., Philadelphia, 1912); F. H. Thorp, *Outlines of Industry Chemistry* (New York, 1912); E. Thorpe, *Dictionary of Applied Chemistry* (5th rev. ed., London, 1912-13).

**SOAPBARK TREE** (*Quillaja saponaria*). A medium-sized tree belonging to the family Rosaceæ, native of Peru and Chile and cultivated in other countries. The bark contains saponin and yields a lather with water. In a powdered form the bark is used in cleaning fine fabrics, especially woolens. It is also employed in mineral waters, shampoos, etc., to produce foam. A tincture of the bark is used in medicine.

**SOAPBERRY** (*Sapindus saponaria*). A West Indian tree, 25 to 30 feet tall, of the family Sapindaceæ, occurring also in southern Florida. Its pulpy fruit, which contains saponin, is used instead of soap in washing—a use apt to injure linen. With the exception of *Sapindus drummondii* a tree 30 to 40 feet in height, found in the southern United States from Florida to southern Kansas, the genus is tropical or sub-tropical. The fruits contain shining black, very hard nuts, formerly used for making buttons. See SAPINDACEÆ.

**SOAP BUBBLES.** Many important applications of the mechanics of liquid surfaces can be studied very conveniently by means of soap bubbles and soap films. The fundamental property of such surfaces is that they always contract as much as possible. Thus a bubble contracts until the process is stopped by the pressure of the enclosed air. The formula connecting this pressure with the radius of the bubble is  $p = \frac{4T}{r}$  where  $T$  is a constant measuring the "surface tension" of the liquid. (Inside a drop, the pressure is  $\frac{2T}{r}$ . A bubble has two contracting liquid surfaces, and so the pressure is twice as great as in a drop.) By measuring the diameter of a bubble and the pressure upon the air within, the surface tension of the film can be measured. Naturally the pressure in a small bubble is greater than in a large one because the curvature of the surface is greater. This

FIG. 1.

is shown if two bubbles of different sizes are joined as in Fig. 1, when it will be observed that the partition film  $p$  is always convex into the larger bubble  $A$ , being pushed to that form by the greater pressure in the smaller bubble  $B$ . In air quiet and free from dust two bubbles may be rested against each other (Fig. 2, *a*) like two elastic balls, but if a stick of sealing wax be rubbed to electrification and brought near them they will coalesce (Fig. 2, *b*). One bubble may be blown inside of another (Fig. 3, *a*). Then electrification will cause it to fall through the outer bubble to the form Fig. 3, *b*. Soap-bubble films on wire frames arrange themselves in a manner well to confirm and illustrate the laws of the composition and equilibrium of forces. A wire frame (Fig. 4, *a*) with a thread tied upon it is instruc-

FIG. 2.

tive. If it is dipped in soap solution and a complete film put on it the thread will move freely about in the film, but if the film on one side of the thread be broken the film on the other side will pull the thread to the form *b*. If the thread have a loop in it the form *c* may be obtained and the open ring will move freely about in the film. A good solution is made of fresh oleate of soda with a little glycerin, or Castile soap may be used. Great care must be exercised to keep the solution free from dust, but it must not be filtered. Consult C. V. Boys, *Soap Bubbles and the Forces which Mold them*, in "Romance of Science Series" (London, 1900). See CAPILLARITY; INTERFERENCE.

FIG. 3.

FIG. 4.

tive. If it is dipped in soap solution and a complete film put on it the thread will move freely about in the film, but if the film on one side of the thread be broken the film on the other side will pull the thread to the form *b*. If the thread have a loop in it the form *c* may be obtained and the open ring will move freely about in the film. A good solution is made of fresh oleate of soda with a little glycerin, or Castile soap may be used. Great care must be exercised to keep the solution free from dust, but it must not be filtered. Consult C. V. Boys, *Soap Bubbles and the Forces which Mold them*, in "Romance of Science Series" (London, 1900). See CAPILLARITY; INTERFERENCE.

**SOAPFISH** (so called from the unctuous skin, due to smooth scales and an excessive flow of mucus). 1. A West Indian fish (*Rypiticus saponaceus*), related to the sea bass and locally called jabor and jaborillo. It is of small value. 2. See LIZARD FISH.

**SOAPSTONE**, **STEATITE**, or **TALC ROCK**. A rock composed essentially of the hydromagnesian mineral talc, but never chemically pure, owing to the presence of varying quantities of other minerals, such as mica, chlorite, amphibole, pyroxene, etc. Soapstone is a massive rock, of bluish-gray to green color, and soft enough to be readily cut with a knife. It is a secondary rock, derived from the alteration of magnesian silicate minerals by metamorphism. Soapstone, though durable, is undesirable for building purposes because of its dark color. On account of its softness, insolubility, and heat-resisting qualities it is widely used, these uses including wash or laundry tubs, electric switchboards, insulators, table tops, and, in the case of the harder varieties, stair treads.

**SOAPWORT** (*Saponaria*). A genus of plants of the family Caryophyllaceae. *Saponaria calabrica* is a favorite garden annual. Common soapwort, bouncing Bet (*Saponaria officinalis*), is found on roadsides and banks of streams in many parts of Europe and America. Both root and leaves contain saponin and are sometimes employed for washing; the bark of the root, however, is apt to reddens white articles. Some species of *Gypsophila*, and allied genus, are called soaproot and contain saponin. Thus the Egyptian soaproot (*Gypsophila fastigiata*) and the Spanish soaproot or jabonera (*Gypsophila vaccaria*), which are in commerce, have been employed for washing from time immemorial, and the roots, not having a dark rind, can be used upon white articles and upon fabrics that will not bear the action of soap. A number of species of *Gypsophila* are grown in gardens as ornamentals.

**SOBAT**, só-bät'. A tributary of the upper Nile. Its headwaters rise in western Abyssinia and the upper Sudan, and it flows northwest, joining the Nile in about lat. 9° 30' N. (Map: Africa, H 4). Its length is about 700 miles, and it has been ascended by gunboats over 200 miles. Several of its tributaries are also navigable. Its union with the upper Nile forms the White Nile, a name derived from the characteristic color of the Sobat waters.

**SOBIESKI**, só'bě-ěs'kě, JOHN. See JOHN III SOBIESKI.

**SOBK**, or **SEB'EK** (Gk. Σούχος, *Souchos*). An Egyptian deity, represented either in the likeness of his sacred animal, the crocodile, or as a man with a crocodile's head. At Ombos he was combined with the sun god Re, in the Libyan nome he was regarded as a manifestation of Osiris, but in the Fayum (q.v.) his worship especially flourished. There dwelt the incarnation of the god, the sacred crocodile Souchos, fed and ministered to by priests of its cult. After death the body of the sacred reptile was carefully embalmed and was laid away in one of the crypts of the Labyrinth (q.v.). The worship of Sobk extended far down into the Roman period, and the god is mentioned in Fayum papyri as late as the third century A.D. See EGYPT, *Ancient Religions*.

**SOCAGE**, sōk'āj (AS. *sōc*, inquiry). A tenure of lands in England by which a tenant or owner of land is obliged to render certain fixed services or pay a fixed annual rent to the lord of whom the lands are held. The distinguishing feature of this form of tenure was its certainty and definiteness. Some land was so held before the Conquest, but it was not a common tenure until about the reign of Edward I. Tenure by free and common socage formerly prevailed in the United States, but has now been abolished by statute in most States, as in New York.

Where an estate held in socage descended to an infant under the age of 14 the guardian of the infant was known as a guardian in socage. See GUARDIAN; REAL PROPERTY; TENURE.

**SOCIAL BRETHREN CHURCH**, THE. A religious body, represented chiefly in the States of Arkansas, Illinois, and Missouri. It was formed in 1867 by members of different churches, whose views diverged as to certain points of doctrine and discipline. A book of doctrine and discipline was published in 1887. In the 10 articles of the Confession of Faith, the doctrines of the Trinity, the authority of

the Holy Scriptures, redemption, and regeneration are defined substantially as they are understood by the evangelical churches. Baptism and the Lord's Supper are regarded as ordinances that were made binding by Christ and were instituted for believers only. The members number about 1000. In addition to the regular preachers, exhorters, stewards, and ordained deacons are recognized. Consult H. K. Carroll, *The Religious Forces of the United States* (New York, 1912).

**SOCIAL CONTRACT**, or **SOCIAL COMPACT**. Terms used interchangeably by many writers and having reference to a theory of the origin of human society. The theory was first systematically enunciated by Hobbes in the seventeenth century, but received its fullest development at the hands of Rousseau towards the middle of the eighteenth. It was discussed with much force also by Thomas Hooker and John Locke. The theory assumes that society is not a natural institution, but the result of convention among men. It assumes the existence of a presocial state in which men were in a state of nature without rights or obligations and subject to no law except the law of nature. Hobbes's view of a state of nature was that of a condition in which all men were at war with one another. Locke differed somewhat with Hobbes in his view of the state of nature, holding that it was one of perfect freedom, but limited by the fact that a man must perform every action in subservience to the law of nature. He did not regard it as a state of license or a condition of perpetual warfare. He recognized the individual right of property in the presocial state. Similarly Rousseau maintained that presocial men were not warlike, but averse to combat, if not actually timid. According to any view of the nature of the presocial state the life of man was beset by many difficulties. To escape from these, men agreed to surrender certain of their so-called rights and to form a covenant for the protection of other rights. Each therefore entered into a contract with all by which he agreed to divest himself of the natural liberty of hindering his fellow men in their efforts to obtain the same right. Rousseau's contribution is especially important, historically considered, for he held that sovereignty resided not in a ruler but in the community. Certain leaders in the American and French revolutions were strongly influenced by this doctrine.

The theory of the social compact as a means of accounting for the origin of existing institutions is now generally considered to be a legal fiction. The application of the theory as the starting point in the evolution of the state presupposes a highly developed state life, which is never consciously present in the minds of primitive individuals. Such a consciousness is attained only by historical development. Anthropology has proved that the presocial savages described by the advocates of the social-contract theory were totally incapable of conceiving the idea of contract as a means of state organization. From the historical point of view, however, especially as it affected the ideas of certain leaders in the American and French revolutions, the doctrine is important for the idea of a contract entered into by men involved a denial of the divine origin and rightfulness of the existing (monarchical) system.

Waller, ib., 1904); J. J. Rousseau, *Social Contract* (Eng. trans. by H. J. Tozer, 4th ed., ib., 1905); John Morley, *Rousseau* (ib., 1910); C. Y. C. Dawbarn, *Social Contract* (ib., 1910).

**SOCIAL DEBTOR CLASSES.** A term that has come into use in the literature of pauperism and criminology, and to some extent in the literature of social reform, to designate all of those elements in a modern population that either prey upon society or obtain from its bounty more than they give back in useful work. Radical reformers who insist that most of the misery of the defective and degenerate is caused by social injustice deny that the classes designated as social debtors are such in fact, and say that if the term has any meaning at all it can most appropriately be applied to the idle rich who render no definite service to the community. See CHARITIES; CHARITY ORGANIZATION SOCIETY; DEGENERACY; DEPENDENTS, DEFECTIVES, DELINQUENTS; MENDICANCY; SOCIALISM; SOCIAL SETTLEMENTS; SOCIOLOGY.

**SOCIAL DEMOCRACY.** See SOCIALISM, *Socialist Parties*.

**SOCIAL EVOLUTION.** See EVOLUTION.

**SOCIAL INSECTS.** See INSECT.

**SOCIAL INSURANCE.** Insurance of workmen against sickness, accident, old age, unemployment, including relief of widows and orphans. Owing to the inability or the unwillingness of the working classes to insure themselves against loss of income from these various causes, the state imposes upon them the duty of paying premiums or taxes, in return for which they are entitled to the insurance benefits. In most cases the full cost of such insurance is not laid upon the beneficiaries, but is distributed and placed partly upon the employer or upon the local community and the state.

The principle of workmen's compensation or insurance against the financial losses from industrial accidents has been adopted in all the European countries except Turkey, in most of the British colonies, and in some of the South American countries. Insurance of workmen is either through accident insurance proper or through the so-called workmen's compensation laws.

The German accident insurance law is perhaps the best example of foreign legislation. It was enacted in 1884, and subsequently extended till now it covers workmen and salaried employees, the latter up to \$1250 yearly earnings, in industry, mining, manufacturing, transportation, and agriculture. Any one injured in the course of his employment in these occupations is entitled to the benefits as follows. In case of death compensation includes a funeral benefit and pensions for dependent survivors. The funeral money is equal to one-fifteenth of the annual earnings of the deceased with a minimum of \$12.50. A pension of 20 per cent of the annual earnings of the deceased is paid to the widow till her death or her remarriage: 20 per cent is paid to each dependent child under 15 years of age; but in no case may the total of pensions paid to survivors exceed 60 per cent of the annual earnings. In case of the remarriage of a widow the pension is commuted

to a single payment amounting to three times the annual earnings of the deceased. If the pensions paid to the widow and children do not equal 60 per cent of the annual earnings, further pensions may be granted up to a maximum of 20 per cent for dependent heirs in the ascending line, and up to 20 per cent for brothers and sisters and heirs in the descending line in so far as they were dependent on the deceased at the time of the accident. In computing the amount of the pensions only one-third of the excess of annual wages over \$450 is counted in the earnings in the meaning of the law.

Compensation for disability includes free medical and surgical treatment and a pension based on the degree of disability. For total disability 50 per cent of the daily wage is paid up to the end of the fourth week, after that 60 $\frac{2}{3}$  per cent as long as disability lasts. In case of complete helplessness the pension may be increased up to the full "annual earnings." For partial disability a pension is paid corresponding roughly to the decrease in the earning power suffered by the injured workman.

The law is administered largely through compulsory associations of employers. An association is formed for each major employment: it levies an assessment each year to cover actual (current) cost of pensions for the preceding twelvemonth; it prescribes safety regulations and sees to their enforcement; it has power to penalize an establishment which has unusual accident rate or which does not conform to a specified standard. In the exercise of these functions it is supervised by the Imperial Insurance Office. By these means the economic burden of accident insurance is made equal to all employers in the same trade, the interest of the workmen is safeguarded in minimizing the risk of accident, and it is made for the interest of all employers to introduce the best safety appliances because of the saving in cost. The associations decide in first instance whether an injured workman is entitled to a pension and to what amount. Appeal without cost is permitted to the workmen to boards in the Higher Insurance Offices on which boards both employer and workmen are represented.

Under the system of making the employer responsible for the cost of accidents and placing upon employers' associations the responsibility of inspection of machinery, safety rules, and accident prevention in general, the rate of fatal accidents decreased in Germany from 0.77 per 1000 insured in industrial corporations in 1886 to 0.59 in 1911. Accidents causing permanent disability decreased from 0.73 per 1000 insured in 1887 to 0.64 in 1911. The cost of insurance decreased notably in many industries as a result of a decrease in the frequency of accidents. The assessment in bridge construction (other than iron) decreased from 3.07 per cent of the wage cost in 1895 to 2.32 per cent in 1908. The cost of accidents in railroad construction in 1908 was only half the rate in 1890; the cost in electrical-apparatus factories has likewise been cut in two.

The entire cost of accident claims is laid upon the employing corporations with the exception of the medical and sick benefits, which during the first 13 weeks are paid for by the sickness insurance funds. It is estimated that the workmen in contributing two-thirds to the sickness insurance funds pay about 8 per cent of the cost of accident insurance.

The following table shows the population, wage earners, and the number of those insured against accident in the principal European countries.

COUNTRY	Date	Population	Wage earners	Insured against accident
Austria . . .	1909	27,800,000	10,000,000	3,710,000
Finland . . .	1909	3,000,000	500,000	100,700
France . . .	1911	40,000,000	10,000,000	4,250,000
Germany . . .	1911	65,000,000	16,700,000	24,600,000
Great Britain . . .	1911	45,200,000	14,000,000	13,000,000
Hungary . . .	1909	21,000,000	3,200,000	1,160,000
Italy . . .	1911	34,700,000	10,500,000	1,800,000
Luxembourg . . .	1910	260,000	55,000	38,701
Netherlands . . .	1909	5,900,000	1,500,000	500,000
Norway . . .	1910	2,400,000	400,000	381,800
Rumania . . .	1911	7,070,000	250,000	180,000
Russia . . .	1910	145,600,000	6,500,000	2,400,000
Sweden . . .	1910	5,500,000	1,000,000	250,000
Switzerland . . .	1910	3,800,000	800,000	700,000

The main features of the accident-insurance laws of other countries are similar to the provisions already noted in the German legislation. Variations in scope, benefits, administration, etc. occur. Agricultural labor is not entitled to the benefits of insurance in most European countries outside of Germany and Great Britain. Russia excludes transportation and the building trades. There is usually a minimum number of employees, varying from 5 to 15, which an establishment must employ to be subject to insurance. In most European countries full medical benefits are granted. For total disability the pension is usually 50-60 per cent of the wages; in Germany it is 66 per cent, in the Netherlands 70 per cent, and in Switzerland 80 per cent. The cost of minor accidents is met in Germany, Austria-Hungary, and Russia by the compulsory sickness insurance system. In granting compensation for death Great Britain, Belgium, Italy, Denmark, and Spain pay a lump sum instead of a pension to the widow. The whole cost of insurance is laid upon the employer except in Austria, where the workmen contribute directly 10 per cent to meet the expenses.

Workmen's compensation laws have been adopted in 25 of the United States. They are modeled more or less upon English and German legislation. The first law of those now in force on the subject of compensation was the Federal Act of 1908 applying to employees in certain departments of the national government. Three of the early State laws have been declared unconstitutional—that of Maryland passed in 1902, the Montana Law of 1909, and the New York Compulsory Law of 1910. Subsequent laws may be classified in three groups: 1. Purely permissive laws, such as the acts of Massachusetts and of New York (1910) which allowed employers by contract with their workmen to make special arrangements for compensation to avoid their common-law liability; these remained a dead letter. 2. The so-called elective laws permitted the employer to elect whether he would pay premiums to the State insurance fund under the compensation system or would submit to a suit at common law with the usual defenses of contributory negligence, negligence of a fellow servant, and assumption of risk removed. The object of this method is to avoid the constitutional difficulty. Massachusetts, Illinois, New Jersey, Michigan, Wisconsin, Kansas, New Hampshire, and many others have

adopted this system; in the first four mentioned a majority of employers have elected to come in under the compensation plan. 3. Compulsory compensation laws have been adopted in Washington, New York (1913), Ohio, Arizona, and California.

The scope of these laws is much more restricted than in European legislation. Many apply only to the extrahazardous occupations. Most of the laws exclude domestic service and agricultural labor. The benefits paid are usually 50 per cent of the wages of the injured person in case of total disability, often with a maximum limit of \$3000 to \$5000, and usually with maximum and minimum limits of weekly payments. Funeral expenses are provided in case of death with a pension or a lump-sum payment for the widow. Adequate provision is made for hospital and medical care in but few cases.

The New York Law of 1913 is one of the most liberal in the benefits given. It allows two-thirds of the wages of the injured employee for total disability during the continuance of disability; for temporary total disability an upper limit of \$3500 is set. For permanent partial disability two-thirds of the wage is paid for specified periods for different injuries, e.g., for loss of hand 244 weeks, arm 312 weeks, foot 205 weeks, eye 128 weeks, etc. For temporary partial disability the employee receives two-thirds of the difference between his former average weekly wage and his present earning capacity during the continuance of disability; the total cost must not exceed \$3500. The weekly compensation must not exceed \$15 a week nor be less than \$5 a week, except that in case of loss of hand, foot, etc. it must not exceed \$20, and in case the full wage of an injured employee is less than \$5 he receives only the full weekly wage. In case of death funeral expenses up to \$100 are allowed. A widow receives 30 per cent of the average wage of the deceased during her widowhood, with two years' compensation in a lump sum in case of remarriage. Ten per cent is added to the pension for each child under the age of 18 and is paid till he reaches that age. The total pension received by the survivors must not exceed two-thirds of the wage. If there are surviving children but no surviving wife, each child under 18 receives 15 per cent of the wages of the deceased. Grandchildren or brothers and sisters under 18, parents, or grandparents may receive a pension of 15 per cent if dependent upon the victim at the time of the accident and if pensions to other survivors do not equal the maximum of two-thirds of the wages. Medical aid, etc., must be provided by the employer for a period of 60 days.

The cost of German accident insurance varies from \$0.10 to \$14.92 (wrecking operations) per \$100 of wages paid. An average rate for hazardous industries is approximately \$3. The rates in Germany for six hazardous industries are compared in the table with the rates as charged under the old New York Employers' Liability Law and under the Workmen's Compensation Law.

These figures indicate that the true cost of compensation, if the cost in Germany under mutual associations of employers can be considered as approximating the true cost, should not mean a very great increase over the present charges in these industries. For all industries

the cost of adequate compensation may be estimated to be about twice the charge of employers' liability.

A second division of social insurance is insurance against sickness. This is much less

INDUSTRY	N. Y. Employers' Liability Law	Workmen's Compensation	German Assessments

\* Estimated.

Germany was the first country to introduce compulsory sickness insurance. Prior to the enactment of the law miners had been insured in their compulsory associations (1854), and the communes had been authorized as early as 1849 to compel journeymen and work assistants to join local sickness funds. There was a system of local parish sickness relief in Bavaria. To extend the benefits of insurance a law was passed in 1884 making insurance against sickness compulsory on all workmen in industry. The law now extends to workmen in mines, quarries, saltworks, factories, railroads, inland navigation, construction, commerce, post and telegraph service. Domestic servants and workers in the home industries were included by an extension of the law in 1914, but during the war this provision was suspended. Employees earning more than \$500 per year are not required to insure. The cost is divided so that two-thirds is borne by the workers and one-third by the employers. There are several different kinds of sickness insurance organizations: local sick funds, establishment funds, building-trades funds, miners' funds, guild funds, mutual-aid funds, and the communal sickness insurance funds. Of these the first two are the most important.

The regular benefits include free medical attendance and medicines for the duration of sickness up to a maximum of 26 weeks, after

which the case is taken care of by the invalidity insurance associations. Sick money, equal to one-half of the usual local daily wage of ordinary unskilled labor, is paid for every working day beginning with the third day of sickness. Instead of sick money and medical care the patient may be placed in a hospital. Most of the funds are required to give in addition a benefit equal to sick money for a period of six weeks for childbirth, if contributions have been paid for at least six months previous. Funeral money equal to 20 times the average daily wage is paid. Besides these regular benefits, which the funds are obliged to give, they may give in addition sick money for a year instead of for 26 weeks only, equal to three-fourths of the daily wage, payable for every day of sickness; they may give sick pensions to the dependents of an insured workman in case the workman is undergoing hospital treatment; hospital treatment may extend to a year, funeral money may be doubled, with a minimum of \$12.50, and made payable in case of the death of a member of the family of the insured. Medical attendance may be given to members of the family, and the benefits in case of childbirth may be increased.

The contributions are levied by the local funds sufficient to meet the cost of the benefits offered by it. The cost may not exceed 6 per cent of the wages; an average cost is between 3 and 4 per cent. A large proportion of the funds offer more than the regular benefits. The workmen, who contribute two-thirds to the cost, are permitted to elect two-thirds of the members of the executive boards of the sick funds. Much criticism has arisen over the tendencies of these boards, many of which are distinctly social-democratic in composition. Each fund is allowed to make contract with the physicians of the locality for the performance of services to the insured workmen, and many controversies have arisen over the remuneration and selection of these favored physicians. Contracts with apothecaries regulate the supplying of medicines, etc.

Each insured person is sick on an average eight days per year, costing (average) \$0.80 per day for sick money, medicines, medical care, etc.

Permanent sickness or invalidity is cared for under the Invalidity Insurance Law. See OLD-AGE PENSIONS.

The compulsory sickness insurance laws of the other European countries are modeled very closely upon the German law. Austria passed a law in 1888, Hungary in 1891; Norway followed in 1909, Servia in 1910, Great Britain in 1911, and Russia and Rumania in 1912. In Italy, the Netherlands, Belgium, and Sweden proposals are under discussion. In Great Britain recognition had to be given to the already existing friendly-aid societies, and they are made the organ of administration. Right of rejection of poor risks is permitted. A minimum membership of 5000 is required, as against 100 under the German plan. Rejected and uninsured persons are permitted to deposit savings in the post office to be utilized in case of sickness. The British system treats invalidity as a part of the insurance against sickness. Weekly contributions are required of workmen, employer, and state as shown in table on page 230.

In Rumania all the cost is placed on the employee. In Servia the contributions of employer and employee are equal. Russia divides

the cost two-thirds for the worker and one-third for the employer, but places the entire cost of medical aid on the latter. Norway puts

State	2d.	2d.

60 per cent of the cost on the employee, 10 per cent on the employer, 10 per cent on the commune, and 20 per cent on the state.

In France miners are required to insure themselves against sickness, paying contributions up to 2 per cent of their wages, to which the employers add a subsidy equal to one-half of the contribution. Seamen and railroad employees are likewise required to insure. Except for these special laws, sickness insurance is left entirely to the workmen themselves. Railroad employees in Italy are required to insure.

Voluntary insurance against sickness is well developed in France, Italy, Denmark, the Netherlands, and Sweden. It is carried usually through the medium of mutual-aid societies or through the trade unions. A grave defect is frequently the lack of a sound actuarial basis. Approximately 10 per cent of the population in France, 5 per cent in Belgium, 25 per cent in Denmark, 10 per cent in Sweden, 3 per cent in Italy were voluntarily insured against sickness. In Spain less than  $\frac{1}{2}$  of 1 per cent are insured. The amount of the benefit granted is usually independent of the wages received. In France it is on an average about \$0.30 a day, in Italy seven-tenths of the societies grant less than \$0.20 a day. In Great Britain the benefits are substantially higher. Usually a time limit of from 4 to 26 weeks is placed on the receipt of the sickness benefit. In all these countries the mutual-benefit societies have been regulated by law and societies satisfying certain requirements have been granted privileges. In order to encourage the formation and development of these societies direct government subsidies have been given to recognized funds in Sweden since 1891, Denmark since 1892, Belgium since 1904, France since 1910, and in Switzerland since 1912. Denmark added a subsidy of one-fifth the revenues of the societies from dues with a maximum limit of \$0.54 per member. The Swiss benefits are somewhat more liberal, those of France and Belgium rather insignificant. The subsidies have had a considerable effect in stimulating the growth of the societies in Denmark and Sweden. The chief elements of weakness are the limited membership and the small amount and duration of the benefits.

Sickness insurance is not very widespread in the United States. Many of the national and local unions have benefit features, and a small proportion give benefits for temporary disability. In the benefit funds, establishment and railroad funds, and in the unions a total of approximately 1,130,000 workmen are insured (1907). In the mutual sick-benefit associations including the fraternal organizations which made provision for sickness, 825,770 certificates were in force at the close of 1910 and \$2,375,967 was paid out for claims. Besides these, in health and casualty companies, perhaps 200,000 work-

ers are insured. Altogether approximately 2,000,000 workmen are protected against sickness in the United States.

Insurance against unemployment is comparatively undeveloped. The difficulties of determining when a man is unemployed as distinct from out on strike or lazy and of controlling the payment of benefits have deterred governments from attempting to insure against unemployment. The risk of unemployment is dependent partly upon personal qualities. Trade unions have given out-of-work benefits to their members. In Great Britain 1,500,000 members of unions out of a total union membership of 2,500,000 enjoyed the benefit of protection against unemployment. In Germany some 2,000,000 union members are protected through the unions. American unions have not developed unemployment benefit features, only \$240,717 being distributed in out-of-work allowances in

	No. funds	Workmen	Spent on Temporary Disability
National unions	19	375,000	\$830,000
Local unions	346	100,000	200,000
Industrial benefit funds	35	55,000	250,000
Establishment funds	374	300,000	1,200,000
Railroad funds	31	300,000	2,000,000
Approximate totals	805	1,130,000	\$4,480,000

1910. Trade-union control reduces the danger of malingering to a minimum, and in the same trade the risk of unemployment is more or less evenly distributed.

The Ghent system of unemployment insurance, which was organized in 1900, is really a system of liberal subsidies to unions which give out-of-work benefits. Usually the subsidy equals 60 per cent of the original sum paid to the unemployed, but is not paid for more than 60 days in one year to the same person. Forty-three unions with 18,500 insured participated in the benefits in the city of Ghent; in eight years \$130,000 was paid for 375,000 days of unemployment, \$44,000 of which was given by the city.

A number of large municipalities in Belgium, France, Germany, and Holland have adopted the Ghent system; Belgium since 1907 gives a small subsidy to communal unemployment funds; France gives a small aid to unemployment associations; Norway and Denmark have national systems of subsidized insurance covering about 50,000 persons in Norway and 100,000 in Denmark. Under the Norwegian law one-half of the wage is the maximum limit of an unemployment benefit, and in Denmark the benefit varies from \$0.13 to \$0.54 a day. Altogether approximately 250,000 wage earners are insured under the Ghent system.

Great Britain is the only country that has established compulsory insurance against unemployment. The law applies to construction and engineering occupations only and includes 2,400,000 workmen. The employer and the employee contribute equally, five cents a week apiece, and the state adds a subsidy of  $3\frac{1}{2}$  cents. In case of unemployment the workman receives \$1.75 per week for 15 weeks in any one year, provided he has to his credit five weekly premiums for every weekly benefit he claims. No benefit is given for the first week. The dues are all placed in a general fund. The unions are permitted to make use of the fund with the

employers' and the state subsidies to continue their own out-of-work benefits at reduced cost. The employer may claim reimbursement of one-third of his own contributions for each employee continuously employed by him (40 weeks in the year). Each insured workman at the age of 60 may claim the return of the difference between his contributions and the amount drawn by him in unemployment benefits. In times of industrial crisis the benefits may be lowered to \$1.25 a week and the dues may be increased by two cents a week for both employer and employee. The experience up to the outbreak of the war indicated that the receipts were more than enough to cover the expense. An indispensable feature of the law is the establishment of national labor exchanges, by which unemployment can be kept at a minimum, the fact of unemployment can be established, and the payment can be controlled. A man refusing to accept a position at union rates in another district is no longer entitled to his benefit.

A recent development in social-insurance legislation is provision for widows and surviving dependent children of workingmen. In connection with the compulsory old-age pension system of France (1910) death benefits are provided payable in three to six monthly installments of 50 francs each. Germany included pensions for survivors in the benefits offered under the new codification of the Insurance Law (1911). A widow who is or becomes invalid is entitled to a pension equal to 30 per cent of the invalidity pension which the contributions of her husband would have entitled him to receive, plus an Imperial subsidy of \$12.50. A child under 15 receives 15 per cent of the father's invalidity benefit plus a state subsidy of \$6.25. Additional children receive 2½ per cent of this benefit plus the subsidy. An average invalid widow's pension would be approximately \$20 per year as compared with the average invalidity benefit of \$40; an invalid widow with three children under 15 would be entitled to perhaps \$37, or nearly as much as the father would have received in case of invalidity. The contributions to invalidity insurance were increased by an amount varying from one-half to three cents a week to cover the estimated additional expense.

Widows' or mothers' pension legislation has been enacted in 21 States in the United States. Pensions are given to widows or to wives of deserting, invalid, or imprisoned husbands for the care of dependent children. The object is to prevent the break-up of the home and the loss of home influence in cases where the family is worthy of preservation. The allowances are paid either wholly by the State or divided between the State and the county or city. Administration is vested in a special board as in Pennsylvania, or in the juvenile courts as in Illinois and Ohio, or in the poor-relief boards as in Massachusetts. The benefits are fairly liberal, e.g., \$15 per month for one child and \$7 for additional children in Ohio. In Illinois from July, 1911, to November, 1912, 512 families with 1723 children were aided at an average grant per family of \$21.99 per month. Massachusetts gives aid of from \$1 to \$15 weekly. From Sept. 1, 1913, to May 1, 1914, 2209 cases with 6889 children in 140 cities and towns were assisted. A count of 1889 families on February 24 showed an average weekly allowance of \$5.42.

Denmark passed an Act in 1913 which provided for special benefits to needy widows with children to be paid by the state and the local commune. These benefits are distinct from poor relief. An allowance of \$27 a year as a maximum is paid for each child under two years of age; the maximum benefit is \$21.60 for children from 2 to 12 and \$16.20 for children aged 13 and 14.

**SOCIALISM** (from *social*, from Lat. *socialis*, relating to companionship, or association, from *socius*, companion, associate, from *sequi*, to follow; connected with Lith. *sekti*, Gk. *ἐκείβα*, *hepesthai*, Skt. *sac*, to follow, and ultimately with Eng. *see*). As the term is now used, socialism is an ideal economic system in which industry is carried on under social direction and for the benefit of society as a whole. It is contrasted with the competitive régime of existing society. The word "socialism" has been used to convey a variety of meanings and is only gradually assuming a definite significance, as a result of the careful analysis of generations of socialistic thinkers and their critics. Moreover, the ideal organization of socialism has to a great extent been influenced by actual industrial changes.

An earlier term by which socialism was known is communism (q.v.). Efforts to distinguish communism from socialism cannot be said to have been successful. Sometimes communism is used to refer to the voluntary organization of small bodies of men who have common property and who carry on production in common, sharing among themselves the fruits of their toil, as a rule, in such a way as to give each one an equal allotment of economic goods, but not of honors and consideration.

In this sense communism may be distinguished from socialism in that the latter implies a thoroughgoing reconstruction of society through political action, while the former calls upon men to separate themselves from general society and to form communal societies for themselves.

Socialism is sometimes called collectivism. Those who employ this term feel that their schemes of social reform are more likely to secure a hearing if called by some other name than socialism. For a time in the United States the term "nationalism," introduced by Edward Bellamy in his book *Looking Backward*, was synonymous with socialism.

The origin of the word "socialism" has been

the subject of much discussion. It has been claimed that it was first used in 1840 by a French writer, Louis Reybaud, in his *Etudes sur les réformateurs contemporains ou socialistes modernes*. The word, however, was used in the early thirties in England, and the publications of the followers of Robert Owen show that it had become current before 1840. John Spargo, in the *Comrade* of March, 1903, traces the word "socialism" back to 1833.

In addition to the terms "socialist" and "socialism," we have the terms "social democrat" and "social democracy," very commonly used as synonymous. It was long supposed that these words were of German origin, but at least as far back as 1838 they were coined by Bronterre O'Brien, an early socialist, who took part in the Chartist agitation. The words were used by O'Brien in opposition to any aristocratic socialist schemes and in advocacy of democratic socialism.

The constituent elements of socialism and its most essential characteristic must next be examined. The lack of scientific accuracy in popular writings concerning socialism shows that this complex concept is not generally understood, although its formulation has become clear and precise enough, so that it should not be difficult to grasp its essential elements. Socialism implies, in the first place, a changed attitude towards property. Our economic life is dominated at the present time by private property, and in all cases, even where public property is largest in amount, it appears as an exception to a general rule. The world's work is carried on under the domination of private property. Socialism means that this process is to be reversed and that the world's work will ultimately be dominated by public property.

Accumulated wealth is divided by modern economists and socialists alike into productive goods and enjoyment goods. We have also a further distinction between accumulated wealth and income wealth, the annual product of toil, which may be used up each year. Now, as understood to-day, socialism means that the instruments of production shall in the main be public or collective property. While the most conservative socialists do not insist upon public ownership of all land and capital, they consider it essential that the chief kinds of capital and the greater part of the land should be collective property. Socialists formerly held that all land should be owned by society, but lately the most conservative socialists have been inclined to make concessions to small landowners who cultivate their property and to concede to them private ownership so long as they find it desirable. On the other hand, modern socialism has emphasized strongly private property in income. It is on this account that socialists frequently deny most strenuously that they are opposed to private property and claim that they wish to extend private property. They refer always to income. They wish each one to have his income and to have that under his control.

The first constituent element of socialism may therefore be stated to be a substitution of collective property in the great material instruments of production in the place of private property to such an extent that public property shall dominate the world's work. The second constituent element is private property in income and private property in those goods which are used for the sake of enjoyment and not for the

acquisition of an income by rent or hire to others.

Modern socialists desire to disturb existing arrangements as little as possible in attaining the main end of socialism: the abolition of the private receipt of rent and interest, the incomes from private property. With collective ownership the income yielded by land and capital must also become collective. The purpose is the common enjoyment of the advantages yielded by land and capital, in order that there may be no income apart from personal effort and that the income yielded by personal effort may be increased. Socialists generally attempt to establish this view theoretically by the doctrine that all value is to be attributed to labor. The cruder forms of socialism have so emphasized manual labor as to imply an underestimation of intellectual services. With the rise of a higher class of socialistic thinkers, however, this crude view has lost its prominence. Socialists now generally fully understand that intellectual service is as important as manual labor, and they find a place for both in their plans for a future society.

Socialists and economists are alike agreed that production has become largely a social process and that the socialization of production increases day by day. What the socialists complain of is that, while production is a social process, the control of production is in the hands of private owners. They discover an antithesis between social production and individual control and demand accordingly that the socialization of production shall be accompanied by social or collective management. Modern socialism demands collective management of each industry, and it demands that all the industries should be associated together in order thereby to secure perfect system, harmony, and unity of effort. Because individual producers do not act together, but act each one for himself, the socialists reproach present society with planlessness, which they say gives us industrial crises and stagnation.

Finally, socialism means the distribution of income by some common authority. If organized society owns the instruments of production and conducts production, necessarily the product of industry in the first instance falls to society, as it does now to the individual owners and managers. Society must then in some way divide up the income which results from collective economic efforts, giving to each one his due share. Under socialism the great mass of men would be salaried functionaries of society, and the aim would be in one way or another so to adjust their salaries that in the aggregate they should equal the total wealth produced for consumption.

Formerly there was a greater inclination on the part of socialists than there is now to accomplish their ends by measures of compulsion. It was proposed that every one should be forced into the system of collective production and in return receive a subsistence. Modern socialism does not propose directly to force any one into the socialistic scheme. If any one is able to gain a livelihood by his private efforts, socialism is quite content that he should do so. He will not be able to gain an income from ownership of the chief instruments of production, as these will be public property. He may, however, own tools which he can use in production, if he can induce men to purchase his product. Socialism contemplates a public provision for education as at the present time, but it does not propose to throw any obstacles in the way of a man who desires

to organize private schools. A public organization of medicine is contemplated by socialism, but the modern socialist does not see any reason why a physician who desires to engage in private practice should not do so, if he can find those who prefer his services to those of the public physicians.

Modern socialism is international and cosmopolitan. With the growth of the business unit and the cheapening of transportation, the economic ties binding men together have extended geographically until the whole world may be said to have become a single economic unit. It is natural that socialism, influenced by the development of economic society, should also have become international. A further reason for the international character of socialism is to be found in the fact that the leaders of socialistic thought, having called in question and having rejected the existing economic order, are also in the mood to call in question the advantages of the existing political order. They see few or no advantages coming to the workers from the national boundaries and arrangements which separate men. They desire fraternity among the toilers, but as a result of national differences they see the toilers fighting each other, and they make the claim that all wars take place at the expense of the laborer and for the advantage of a small military and industrial class, who derive therefrom on the one hand glory and on the other pecuniary profit. It is conceded, however, that certain wars, notably wars leading to territorial consolidation and wars against hopelessly reactionary states, may have a progressive tendency and be useful to socialism in the end.

The internationalism of socialism was one of the leading thoughts of Karl Marx (q.v.). The first noteworthy result of this internationalism was the organization in 1864 of the International Workingmen's Association (q.v.), which declared in the by-laws adopted in its first meeting that the emancipation of labor was a social problem, requiring the coöperation of the most advanced countries. Since 1889 the socialists have held international congresses once in three years, and in 1900 the International Bureau of Socialism was established at Brussels to serve as a common centre for socialism of all countries.

As socialism has grown in strength and become a political power, a more conservative and rational attitude towards nationality has been developed. Patriotism is no longer execrated as a device for blinding the workers to the evils of exploitation. Militant socialism is still far from the glorification of patriotism and does not seek anywhere to cultivate it, but its attitude might be described as at least neutral. The fraternity of workers the world over is still the dominant idea, although it seemed to suffer eclipse upon the outbreak of the European War in 1914, when the socialists of the several warring countries proved eager to take their part in military affairs. In the attitude taken towards the nation there is, however, a line of cleavage among the socialists. In every country there is a conservative or right wing of socialists who favor active participation in the national life and efforts to bring about improvement even in coöperation with older political parties.

The attitude of socialism towards the state has, during the hundred years of its existence, undergone a development in which we may discover several distinct stages. 1. In the first

stage we have as leaders of thought Robert Owen, Etienne Cabet, Count Henri de Saint-Simon, and Charles Fourier (qq.v.). These socialists, with the exception of Owen, did not call particularly upon the state for assistance in their efforts to achieve socialism, preferring generally coöperation based upon voluntary principles. They believed that by establishing communistic settlements they could demonstrate to the world the advantages of socialism, and that very soon all men would join communistic associations which would then in one way or another be federated together. 2. Louis Blanc (q.v.) in the middle of the nineteenth century may be regarded as the one who more than any other founded political socialism. He held that socialists should seek to gain control of political power, and he appealed directly to the state for aid in the establishment of socialism. Ferdinand Lassalle (q.v.) in Germany took a quite similar position, emphasizing most strongly the establishment of coöperative industrial undertakings with the aid of subsidies from the state. 3. A third stage is found in the attitude of the followers of Karl Marx and Liebknecht. These look askance upon existing governments, and the orthodox Marxist is strongly inclined to oppose government ownership and operation of industries by the existing state, which is condemned for following capitalistic principles in the enterprises it manages. The German socialists have, then, no special enthusiasm for the state ownership and operation of the railroads in Prussia, and in the United States the municipal ownership and operation of public utilities is very frequently opposed by individual orthodox socialists. The programme of the socialists is, first, the capture of the existing organs of government by the wage earners, and then the inauguration of public ownership and operation of industries. 4. The fourth stage is represented by the conservative or extreme right faction of the socialists, who are willing to coöperate with existing parties in reforms which are in general harmony with the socialist programme, such as municipal ownership of public utilities and government ownership of railways. These socialists are called opportunists and in France possibilists. The Fabian socialists are the best illustration because they decide upon action in each case as it arises. Democracy is an essential part of political socialism. Political socialism is not merely socialism; it is socialism plus democracy, with an inclination to place democracy first. Democracy to the socialist does not mean the kind of government which prevails in the United States, but the kind of government which is completely controlled by the workers. Direct legislation is favored, and the initiative and referendum as agencies of direct legislation are very generally advocated. As a rule, if not universally, the plan for the operation of industries is election of foremen, superintendents, and managers by the wage earners.

Socialists take a view of the state which in some respects suggests the position of Herbert Spencer and other individualists. They hold that under socialism the functions of the state along many lines will be greatly diminished. Crime, they think, will very nearly disappear, and pauperism will entirely cease. Standing armies will be abolished and a popular militia substituted therefor. The functions of the law courts will also disappear, they maintain, with the abolition of private property in the instru-

ments of production, which is the fruitful cause of litigation. The chief function of government will be found in the administration of industries. They have, therefore, a conception of the state so different from that of the present state that they dislike the expression "the state" and abhor "state" socialism. The word "official" is also objected to because it suggests present bureaucratic governments. The attitude of the orthodox socialist towards the state finds clear expression in the work of the German socialist August Bebel, *Die Frau und der Sozialismus* (51st ed., 1910).

During the evolution of socialist thought which has just been sketched anarchism has become separated from socialism. (See ANARCHISM.) Among early socialists there were variations of opinions concerning government, and some, like William Godwin (q.v.), were inclined to take an attitude of radical antagonism to government as such. We thus find anarchistic tendencies in socialism along with tendencies of a very different and altogether antagonistic sort. The cleavage gradually became more pronounced. Pierre Joseph Proudhon (q.v.) is frequently spoken of as the founder of anarchism, and in him we find the doctrines of anarchy reaching such a development that probably more than any one else he is to be designated as the founder, although his views are not worked out so clearly and systematically as those of his followers. For the sake of convenience we may take Proudhon's book *What is Property?* and the date of its appearance, 1840, as the beginning of modern anarchism. The form of anarchism founded by Proudhon is that of complete individualism. This type of anarchism has had some development in the United States under the leadership of Benjamin R. Tucker (q.v.).

The anarchists of whom we hear most are of quite a different stripe, and their anarchism is, by way of distinction, known as anarchist communism. This school of anarchy was founded by Mikhail Bakunin (q.v.) and may be regarded as an outgrowth of the International Workingmen's Association, to which Bakunin belonged. Bakunin and Marx for a time worked together; they both regarded themselves as socialists. Marx calling himself a communist and Bakunin describing himself as a collectivist. Socialism and anarchism were not at first recognized as antagonistic principles, but the differences between them developed continuously. The anarchist communists held to the doctrine of associated effort and considered themselves as true communists and not as individualists. They are radically opposed to public authority and believe that with the abolition of the state men will spontaneously form coöperative associations which will voluntarily form federations for mutual aid. Like the socialists, the anarchists advocate a coöperative commonwealth, but they differ from the socialists with respect to the organization of that commonwealth and more especially in the methods whereby it is to be reached. The question of tactics has been largely instrumental in the growth of hostility between socialists and anarchists. Anarchists deny that the state rests upon any ethical foundation, and consequently there can be no wrong in opposing government and seeking its overthrow. Government to the anarchist means force and nothing more, and the question of resisting it is one of expediency only. If the anarchists believe that they have a superior force, they must necessarily attempt to

overthrow organized government. Socialists, on the other hand, take no such attitude of antagonism towards the state, although they may think and do think that the socialist state will be something different from the present state. They hold, moreover, that changes must come about by evolutionary processes and are opposed to insurrectionary movements where other means are open. Marx and Engels condemned violent methods very early in their career, and, as socialists have taken a part in the work of government in the various countries of the civilized world, they have increasingly favored the maintenance of law and order, believing that their ends can be achieved by legal means. The socialist to-day is the strongest opponent of anarchism. It was the socialists, not the German government, who really drove Johann Most (q.v.), one of the leaders of communist anarchism, from Germany, and it is the German Social Democrats who practically extinguished anarchism in their country.

The attitude of socialism towards the family has varied, but now it has become a definite one of neutrality. Early socialists were inclined to assume a general position of radicalism with respect to all institutions of society, seeing more quickly and easily the disadvantages of any present social arrangement than its advantages. Moreover, the early socialists found the family to be the basis of the economic society which they attacked. Marriage in its present form seemed to them to carry with it the oppression of woman. It cannot be said that socialism ever had a distinct doctrine of the family, but until recent years it was inclined to what would be termed at least lax notions of the marriage tie, holding that the bond of union between man and woman should be love alone, and that when love disappeared there disappeared with it the reciprocal obligations of marriage. Socialists of the present time do not see any reason why they should have a peculiar view of the family, and they are not in this particular distinguished from other people.

The attitude of socialism towards religion has undergone a similar change. The Church as one of the institutions of existing society long appeared to the socialist to be a bulwark of oppression. Modern socialism, however, has separated the economic question from the religious question, and now everywhere regards religion as a "private matter."

Readers of current socialistic literature frequently find a sharp distinction drawn between what is termed Utopian socialism and scientific socialism. Socialism before the ascendancy of Marx was very largely Utopian in character. The early socialist looked upon society as an artificial product and thought it possible to develop a scheme of society which, if introduced, would bring with it a real earthly paradise. It was thought that the very nature of man could be changed by a wisely devised scheme of socialism. Owen's most fundamental social doctrine was that circumstances form the character of man and that right circumstances would give us right-minded and right-acting human beings. In the latter part of the eighteenth century the idea of society as a growth with laws of its own had not been clearly grasped, and adherents of private property as well as communists believed in the possibility of the most fundamental changes by means of a revolution which could take place overnight. The result of this attitude was the

elaboration of all sorts of fantastic schemes. Owen planned his communistic villages of two or three thousand, but the highest development of purely artificial plans is found in Fourierism (q.v.), with its phalanxes and phalansteries. The modern socialist plumes himself upon his science and has a lofty scorn for all Utopian socialism. He may admit that it had its historical meaning and have a certain toleration for it as something belonging to the past, but when he meets it at the present time he views it with even more contempt than does the ordinary economist.

An adequate treatment of the character of this alleged science which underlies socialism requires at least a brief examination of the socio-economic philosophy of Karl Marx, since it occupies a central position in the economics of socialism. The doctrines of Marx are still held in the main by the great body of socialists, and they underlie the platforms of socialist parties throughout the world.

Marx opens his work on *Capital* with an explanation of value. He finds that the element in economic goods which gives and measures value is labor. Labor has its exchange value, and this is governed by the cost of labor, and the cost of labor is determined by the subsistence of the laborer in accordance with his standard of life. The employer of labor pays in wages the cost of labor, but the laborer, according to Marx, produces more than this cost, and the difference between what the laborer produces and the wages of labor he designates as surplus value. This surplus value Marx regards as the source of all rent, interest, and profits. All value, according to the doctrines of Marx, is produced by labor and belongs to labor. Labor receiving, however, only subsistence wages, Marx holds that it is robbed of surplus value, which, through the processes of production and exchange, is transferred to the nonwage-earning classes. Marx maintains that it is only through socialism that labor can receive the full value which it produces, so that surplus value will disappear. This doctrine, while still accepted by perhaps the majority of socialists, is rejected by some and generally receives less emphasis than formerly.

The theory of Marx which just now is much more discussed is that commonly designated as "the materialistic interpretation of history." According to this theory history is made up of successive stages, in each of which the social organization is determined by the methods of production and exchange. The ideal factors in history, such as religion and ethics, are a mere reflection of the underlying economic phenomena. Socialists themselves have been inclined to qualify, and have qualified in all their agitation, this doctrine in such a way as to give a large place to the will of man. They hold that the development of society takes place in accordance with evolutionary laws, but that man himself is a part of the evolution and helps determine it. There is always, however, a marked distinction between this so-called scientific socialism and Utopian socialism, inasmuch as scientific socialism asserts that the will and desires of men can be effective only in so far as they act in harmony with the general tendencies of evolution.

It is important to notice, however, that, in accordance with the teachings of Marx, the evolution of society is such as to lead inevitably to monopoly. Marx believed that large-scale production has an advantage over small production;

consequently that the large producers sooner or later must crush out the small producers, until each branch of production falls under monopolistic control. In the meantime the wage earners are brought together in ever-increasingly large numbers; they are, to use his own words, "schooled, united, and disciplined by the mechanism of the capitalistic processes of production." The inevitable result, he held, would be such a concentration of productive wealth and such great solidarity of the working classes that the system would break down of its own weight and the laborers would gain possession of the means of production.

It is to be observed that each stage in economic development has its own place. Feudalism was once a suitable social organization, but in time it had to make way for capitalistic production. Capitalistic production has performed a service which Marx recognized as clearly as a modern economist, but Marx held that capitalistic production has very nearly run its course and that it has rendered the chief services of which it is capable. Marx held that "along with each decrease in the number of magnates of capitalism there goes an increasing mass of misery and degradation." Belief in the increasing misery of the masses was an essential part of socialistic doctrine a generation ago, but it has to a great extent been abandoned. Intelligent socialists now clearly see that from the masses of men sunk in misery there can come no able and vigorous recruits for socialism. An important practical consequence is that socialists now are more favorably inclined to take immediate measures which elevate the masses, because they hold that thereby men will become better prepared for socialism.

Another theory of Marx finds expression in what is now termed class consciousness. It was, according to him, necessary that the wage earners should become conscious of themselves as a class in the community having interests of their own and that they should rely upon self-help and not upon the help of other classes for their emancipation. Socialists frequently make a distinction now between socialism as a system and socialism as a principle of action. This is a distinction made by Sidney Webb (q.v.), the intellectual leader of the Fabian socialists, and also by Edmond Kelly (q.v.). Kelly regards socialism, or, to use his own term, collectivism, as the method of attainment of justice rather than as a condition of society in which justice has been attained. He has little concern with collectivism as "an ideally perfect state of society," but he looks upon collectivism as a principle of action, pointing out a general line of growth which seems to him desirable and which he believes can be aided by intelligent effort.

Let us now turn to the criticism of socialism by economists. First of all, it should be noticed that no professional economist is a socialist unless it be the Italian Loria (q.v.). Socialists claim that the opposition of all economists does not signify anything as to the correctness of socialism. They maintain that economists are generally blinded by their self-interest, their professional interests requiring them to keep aloof from socialism. The economists, on the other hand, maintain that the rejection of socialism by economists signifies its rejection by science truly conceived.

Economists are not generally inclined to deny the evils in the existing economic order, but

they believe that there is better prospect of improvement under this order than under socialism. They are social reformers, not socialists. They hold, first, that there is no law of evolution carrying us inevitably to socialism; secondly, that the prospects of social reform are sufficiently promising to warrant us in the maintenance of private property in the instruments of production and private management of production; and, thirdly, that socialism carries with it dangers and disadvantages sufficiently grave to warrant us in opposing it until it is clearly seen that great improvements are not compatible with the present social order.

In its details the reasoning of economists against socialism is as varied as the reasoning of socialists in its support. To Marx's labor theory of value economists oppose theories of value which differ in detail, but which agree in placing other forms of cost in coördination with labor in the determination of value. (See VALUE.) To the theory of class consciousness and class action on the part of wage earners as the only means of reform, economists oppose the doctrine that all classes in society must work together for social improvement.

Modern economists recognize the influence of economic forces in social evolution, and recently they have given generous recognition to Marx for his contributions to social theory. Very few economists, however, hold that economic causes alone underlie all social development and that the political and intellectual history of nations is a mere expression of a social organization resulting from the prevailing mode of economic production and exchange.

Socialism implies unified control of production, and economists believe that the disadvantages of such control outweigh the advantages. Economic theory still rests upon the assumption that competition is a principle of progress. Economists seek to point out means for the elevation of competition to higher planes and the removal of the evils which it carries with it, while retaining the principle itself.

The difficulties in the way of the socialization of agriculture are emphasized in opposition to socialism. There can be little doubt that when agriculture is mentioned one of the weakest points in socialism is brought to our attention. Manufacturing industries, commerce, and transportation might conceivably be carried on as public enterprises, but it has never been made plausible that agriculture can dispense with the individual care that is evoked by private interest.

Two other points only in the arguments against socialism can be considered in this place. The first is the danger to liberty. It is maintained by defenders of our present economic society that private property and private enterprise are necessary bulwarks of liberty and that, with these removed or impaired to the extent that they would be even by the most conservative socialism, those having control of the agencies of production would be given such vast power that liberty would be seriously threatened and indeed overthrown by tyranny. There seems to be strong ground for the belief that liberty is better protected in a society having the dualism which we know now, in accordance with which private property and private production on the one hand and public authority with limited public production on the other, are reciprocal checks and restraints.

Finally, it is urged that under socialism there

would be revolutionary discontent. In a world like ours men must necessarily be discontented with what they receive as an outcome of economic production and with the treatment accorded to them in the processes of economic production. At the present time this discontent is directed towards a great many different persons and bodies. On the other hand under socialism the government would be blamed for all mistakes and misfortunes, and this concentrated discontent, it is held, would be revolutionary in character.

So much has been said about Christian socialism that this article should not be concluded without at least a brief reference to it. Christian socialism has had many different meanings. Where the leaders of socialism have been irreligious, Christian socialism has sometimes simply signified socialism plus religion. Now that socialists have come to place religion among private matters in which they are not directly concerned, less is heard than formerly about Christian socialism. Christian socialism has sometimes signified simply a recognition of the principle of social solidarity and a generous sympathy with those classes in society which are the least fortunately situated, more specifically with the wage-earning classes. About the middle of the nineteenth century a body of Christian socialists existed in England and attracted wide attention. They were led by men like Thomas Hughes, Charles Kingsley, James Ludlow, F. D. Maurice, and E. Vansittart Neale. Theoretically they opposed the principle of competition as a source of evil, and did so with great vehemence, and agitated in favor of coöperation in production and exchange. They attempted to organize society on a coöperative basis and succeeded in establishing a number of coöperative undertakings which enjoyed only a temporary prosperity and finally disappeared. They entered, however, into the coöperative movement in England, which had been theretofore largely supported by men acting under the influence of Owen, and they contributed very much to the success of English coöperation.

Socialism of the chair, or professorial socialism, is frequently mentioned, but this also is something as indefinite as Christian socialism. It is not socialism at all, but simply a recognition of grave evils in existing society, a determination to remove these evils, and the conviction that the power of the state must be used to bring about desirable changes. The term "socialism of the chair" originated in Germany and was applied in ridicule to the progressive economists who expressed sympathy with the aspirations of the wage-earning classes. Among the leaders may be mentioned A. Wagner and G. Schmoller (qq.v.). These held that economics is an ethical science and opposed the doctrines of the so-called Manchester school, which looked with little favor upon state action. The changes which have taken place among economists have been such as to lessen the differences among them with respect to economic improvement. Generally speaking, those who in the last decade of the nineteenth century were most inclined to call upon the state for help have become somewhat more conservative, while at the same time those who most strongly antagonized public action have qualified their opposition thereto. The course of events has convinced practically all economists of the importance of labor legislation and of the necessity of state intervention at many

points. Professorial socialism, then, never was socialism, and at the present time it can hardly be said that it indicates a line of cleavage among economists.

**Literature.** The principal writers on socialism have been mentioned in the text, and their writings are mentioned in the articles dealing with them. The *Communist Manifesto* (London, 1848) is perhaps the most important single document in the history of socialism, and Marx, *Das Kapital* (3 vols., Hamburg, 1862, 1865, 1894), is possibly the most important single work. The works of Rodbertus and Lassalle are important historically. *Fabian Essays in Socialism* (London, 1889) is the best work presenting the conservative opportunist socialism. One of the Fabians, Sidney Webb, has written a work entitled *Socialism in England* (2d ed., ib., 1893), which best describes the advances of English socialism as seen by a Fabian. Kelly, *Government or Human Evolution* (vol. i, on Justice, ib., 1900; vol. ii, on Individualism and Collectivism, ib., 1901), gives the best presentation by an American author of socialism as a principle of action rather than as a system. Hyndman, *Economics of Socialism* (ib., 1896), is regarded as one of the best explanations of the economics of the Marxist school. Laveleye, *Socialism To-Day* (Eng. trans., ib., 1885), gives a sympathetic account of socialism by a progressive economist. Rae, *Contemporary Socialism* (new ed., London and New York, 1901), is a more critical account of socialism and, like the preceding, has much historical material. Kirkup, *History of Socialism* (new ed., London, 1900), is a more recent work than Laveleye's and perhaps even more sympathetic, going so far as to advocate a very conservative sort of socialism. Ely's *Socialism and Social Reform* (New York and London, 1894) is an attempt to analyze socialism carefully, to examine its strong and its weak features, and to present, as opposed to socialism, a programme of social reform. It has a bibliography. The same author's *French and German Socialism* (New York, 1883) is a brief historical presentation of socialism in these two countries. Consult also Woolsey, *Communism and Socialism: Their History and Theory* (New York, 1880); Spargo, *Socialism* (ib., 1906); Liebknecht, *Socialism* (Chicago, 1907); Hardie, *From Serfdom to Social Reformer* (London, 1907); Hunter, *Socialists at Work* (New York, 1908); Hillquit, *Socialism in Theory and Practice* (ib., 1909); McDonald, *Socialism and Government* (London, 1909); Skelton, *Socialism* (Boston, 1911); Belloc, *The Servile State* (London, 1912); Simkhovitch, *Marxism versus Socialism* (New York, 1913); Orth, *Socialism and Democracy in Europe* (ib., 1911).

#### SOCIALIST PARTIES

Politically organized socialism or social democracy is a movement which is coextensive with modern industrialism. Wherever a system of production is found which is perhaps somewhat loosely termed capitalistic, we find a Social Democratic party. In this article, however, attention will chiefly be given to the Social Democratic party of Germany, since in Germany that party is more highly developed and far more powerful than in any other country and has a position of intellectual leadership. Influences from the Social Democratic party of Germany, both with respect to theory and tactics, radiate

throughout the entire industrial world. Social democracy is not a German movement, but a world movement, which has, however, its highest development in Germany.

Several reasons may be adduced to explain the preëminence of German social democracy. Wage earners in that country did not begin to share in political power until after the middle of the nineteenth century and so, having formed no political affiliations, were more easily induced to attach themselves to socialism, which had already been eloquently presented to them by Ferdinand Lassalle. Again, the hostility of the government to labor organizations had the effect of turning towards political action the energy that might otherwise have been expended in labor agitation. The third reason for the leadership of Germany is found in the fact that the great intellectual leaders of socialism have been Germans. Marx and Lassalle have already been mentioned, and we may also mention Rodbertus (q.v.), a man who belonged to the landowning class of Germany and who did not take part in socialist agitation.

German social democracy represents an amalgamation of two movements—one starting from Ferdinand Lassalle, the other from Marx and Friedrich Engels (q.v.). Before the time of Marx and Lassalle, Wilhelm Weitling (q.v.) had exercised a certain influence in Switzerland, Germany, and the United States, but the socialism which he advocated was of the French Utopian character and had little permanent influence.

The activity of Marx began in the forties and was continuous from that time until his death. In 1846 Marx belonged to a secret international communistic society called the *Kommunistenbund*. It was for this society that, with Engels, he prepared the *Communist Manifesto*. In 1848 Marx was active in Germany, where a number of labor unions had been established which, united into a federation, came under socialistic influence. The chief field of his activity was the Rhine Province, and it was there that Marx conducted his celebrated *New Rhenish Gazette* (*Neue Rheinische Zeitung*). The reaction soon triumphed, and Marx finally found his way to England, where he made himself in 1850 the head of a German communistic society, which however was short-lived.

We must now turn our attention to Ferdinand Lassalle, who is to be regarded as the real founder of the Social Democratic party, although it soon passed under the influence of Marx and Engels. The agitation of Lassalle began in 1862. In 1863, under his influence, the Universal German Laborers' Union (*Der Allgemeine Deutsche Arbeiterverein*) was founded in Leipzig. The membership was small, and the chief demand was for universal and equal suffrage, although it soon became plain that this was demanded simply as a step towards socialism. Lassalle's chief practical economic demand was for government subsidies to aid in the establishment of productive coöperative associations. Theoretically his arguments centred about the so-called iron law of wages: that wages under the capitalistic system of production naturally fall to a minimum, which barely supports the life of the laborer and his family. The practical demand and the theoretical argument of Lassalle have been rejected by the German Social Democrats, but his eloquence was instrumental in laying the foundation of the party. After the death of Lassalle, in 1864, the International

Labor Association (Internationale Arbeiterassoziation) was established in accordance with the principles of Marx, and the Social Democratic Labor party (Socialdemokratische Arbeiterpartei) was founded in the same year. This party, under the leadership of Wilhelm Liebknecht and August Bebel (qq.v.), entered into opposition to the party established by Lassalle. The Social Democratic Labor party met in Eisenach in 1869 and became known as the Eisenach party. At the election for the Reichstag in 1874, when about 340,000 votes were cast, these were divided with approximate equality between the followers of Lassalle and those of Marx. In 1875 the two parties united and established what is known as the Gotha Programme, which was a compromise. The year 1878 witnessed two attacks upon the life of the German Emperor and then followed the Anti-Socialist Law, which repressed the public agitation of socialism. While the law was in force German socialist congresses were held on foreign soil and their literature was largely printed in Switzerland. The party increased in power, however, the chief result of governmental repression being the welding together of the different factions into a compact party. The Anti-Socialist Law (*Ausnahmegesetz*) expired on Oct. 1, 1890. A certain tendency to violence seems to have developed during this period, for at one of the congresses the expression to struggle for the attainment of ends "with all legal means" was changed to "with all means." The first public congress of the German Social Democracy, after the expiration of the Law of Exception, was held in Halle, Oct. 12-18, 1890. Liebknecht and Bebel dominated the congress and worked for a revision of the Social Democratic platform. This bore fruit the following year at the Erfurt Congress, where the Erfurt Programme was adopted. The peculiar ideas of Lassalle were entirely expunged, and the doctrines of Marx gained a complete triumph. The Erfurt Programme is at the present day the most important official utterance of social democracy and has a world-wide significance, serving as a fundamental basis for every social-democratic platform since adopted throughout the world. This programme reads as follows:

"The economic development of industrial society tends inevitably to the ruin of small industries which are based upon the workman's private ownership of the means of production. It separates him from these means of production and converts him into a destitute member of the proletariat, while a comparatively small number of capitalists and great landowners obtain a monopoly of the means of production.

"Hand in hand with the growing monopoly goes the crushing out of existence of these shattered small industries by industries of colossal growth, the development of the tool into the machine, and a gigantic increase in the productivity of human labor. But all the advantages of this revolution are monopolized by the capitalists and great landowners. To the proletariat and to the rapidly sinking middle classes, the small tradesmen of the towns, and the peasant proprietors (*Bauern*), it brings an increasing uncertainty of existence, increasing misery, oppression, servitude, degradation, and exploitation (*Ausbeutung*). Ever greater grows the mass of the proletariat, ever vaster the army of the unemployed, ever sharper the contrast between oppressors and oppressed, ever fiercer that war of classes between bourgeoisie and prole-

tariat which divides modern society into two hostile camps and is the common characteristic of every industrial country. The gulf between the propertied classes and the destitute is widened by the crises arising from capitalist production, which becomes daily more comprehensive and omnipotent.

"Private ownership of the means of production, formerly the means of securing his product to the producer, has now become the means of expropriating the peasant proprietors, the artisans, and the small tradesmen, and placing the nonproducers, the capitalists, and large landowners in possession of the products of labor. Nothing but the conversion of capitalist private ownership of the means of production—the earth and its fruits, mines, and quarries, raw material, tools, machines, means of exchange—into social ownership, and the substitution of socialist production, carried on by and for society in the place of the present production of commodities for exchange, can effect such a revolution that, instead of large industries and the steadily growing capacities of common production being, as hitherto, a source of misery and oppression to the classes whom they have despoiled, they may become a source of the highest well-being and of the most perfect and comprehensive harmony.

"This social revolution involves the emancipation, not merely of the proletariat, but of the whole human race, which is suffering under existing conditions. But this emancipation can be achieved by the working class alone, because all other classes, in spite of their mutual strife of interests, take their stand upon the principle of private ownership of the means of production and have a common interest in maintaining the existing social order.

"The struggle of the working classes against capitalist exploitation must of necessity be a political struggle. The working classes can neither carry on their economic struggle nor develop their economic organization without political rights. They cannot effect the transfer of the means of production to the community without being first invested with political power.

"It must be the aim of social democracy to give conscious unanimity to this struggle of the working classes and to indicate the inevitable goal.

"The interests of the working classes are identical in all lands governed by capitalist methods of production. The extension of the world's commerce and production for the world's markets make the position of the workman in any one country daily more dependent upon that of the workman in other countries. Therefore the emancipation of labor is a task in which the workmen of all civilized lands have a share.

"The German Social Democrats are not therefore fighting for new class privileges and rights, but for the abolition of class government, and even of classes themselves, and for universal equality in rights and duties without distinction of sex or rank. Holding these views, they are not merely fighting against the exploitation and oppression of the wage earners in the existing social order, but against every kind of exploitation and oppression, whether directed against class, party, sex, or race.

"Starting from these principles, the German Social Democrats demand, to begin with (i.e., of the present state):

"(1) Universal, equal, and direct suffrage by

ballot, in all elections, for all subjects of the Empire over twenty years of age, without distinction of sex; proportional representation and, until this system has been introduced, fresh division of electoral districts by law after each census; two years' duration of the Legislature; holding of elections on a legal day of rest; payment of the representatives elected; removal of all restrictions upon political rights, except in the case of persons under age.

"(2) Direct legislation by the people by means of the right of initiative and of veto; self-government by the people in Empire, state, province, and commune; election of magistrates by the people, with the right of holding them responsible; annual vote of the taxes.

"(3) Universal military education; substitution of militia for a standing army; decision by the popular representatives of questions of peace and war; decision of all international disputes by arbitration.

"(4) Abolition of laws which restrict or suppress free expression of opinion and the right of meeting or association.

"(5) Abolition of all laws which place the woman, whether in a private or a public capacity, at a disadvantage as compared with the man.

"(6) Declaration that religion is a private matter; abolition of all appropriations from public funds for ecclesiastical and religious objects; ecclesiastical and religious bodies are to be regarded as private associations which order their affairs independently.

"(7) Secularization of education; compulsory attendance at public national schools; free education, free supply of educational apparatus, and free maintenance to children in schools, and to such pupils, male and female, in higher educational institutions, as are judged to be fitted for further education.

"(8) Free administration of the law and free legal assistance; administration of the law by judges elected by the people; appeal in criminal cases; compensation to persons accused, imprisoned, or condemned unjustly; abolition of capital punishment.

"(9) Free medical assistance, and free supply of remedies; free burial of the dead.

"(10) A graduated income and property tax to meet all public expenses which are to be raised by taxation; self-assessment; succession duties, graduated according to the extent of the inheritance and the degree of relationship; abolition of all indirect taxation, customs duties, and other economic measures which sacrifice the interests of the community to the interests of a privileged minority.

"For the protection of labor, the German Social Democrats also demand, to begin with:

"(1) An effective national and international system of protective legislation on the following principles:

"(a) The fixing of a normal working day, which shall not exceed eight hours.

"(b) Prohibition of the employment of children under fourteen.

"(c) Prohibition of night work, except in those branches of industry which, from their nature and for technical reasons or for reasons of public welfare, require night work.

"(d) An unbroken rest of at least thirty-six hours for every workman every week.

"(e) Prohibition of the truck system.

"(2) Supervision of all industrial establish-

ments, together with the investigation and regulation of the conditions of labor in the town and country by an Imperial labor department, district labor bureaus, and chambers of labor; a thorough system of industrial sanitary regulation.

"(3) Legal equality of agricultural laborers and domestic servants with industrial laborers; repeal of the laws concerning masters and servants.

"(4) Confirmation of the rights of association

"(5) The taking over by the Imperial government of the whole system of workmen's insurance, though giving the workmen a certain share in its administration."

It is possible to state in a very few words the most essential facts in the history of social democracy in Germany, since the adoption of the Erfurt Programme. One of the main subjects which have agitated the party has been the attitude towards the peasant proprietors, the small farmers, and this same question has agitated social democracy in France and the United States. The support of the small proprietor is essential to the success of social democracy. A programme of confiscation of all land would arouse the hostility of the small farmer. The most conservative wing of the party, therefore, advocates concessions to small farmers, proposing to permit them to hold landed property even under socialism. G. II. von Vollmar, member of the Reichstag and a leader among the Bavarian Social Democrats, is foremost among those who advocate concessions of this sort. This conservative programme, however, has never been officially adopted. Eduard Bernstein, who has already been mentioned as a leader of the conservative socialists, was elected to the Reichstag from Breslau in February, 1902.

So large a party must participate in practical politics in order to live and must therefore have reforms to urge for the immediate future. We have thus, along with the statement of general principles, the so-called immediate demands. This separation of the social-democratic platforms is found in all countries.

Considerable emphasis has been given to the immediate demands, but it is a mistake to suppose that the ultimate goal of complete socialism has been at any time lost sight of. All the leaders have this in mind, but doubtless there are many acting with the Social Democratic party in Germany, as elsewhere, who are chiefly interested in immediate demands.

In late years much discussion has been carried on in the party councils on the subject of militarism and war. On principle the Social Democratic party of Germany, as of other countries, is opposed to militarism. According to the accepted theory the chief cause of modern wars is economic. The struggle of capitalism for markets leads to conflicting Imperialistic ambitions, hence to war. Defensive warfare is accepted, however, as justifiable, and so also is warfare of a "progressive tendency," e.g., wars tending to consolidate fragmentary population groups into unitary states, or wars against reactionary states. The action of the German Social Democrats in supporting the extraordinary taxation for military purposes and in loyally supporting the government upon the outbreak of the Great War is explained on the ground that the war is considered, both defensive and progressive, as against Russia.

The vote of the Social Democratic party and

the number of members elected to the Reichstag since the foundation of the German Empire are given in the following table:

ELECTION IN	Total number of Social Democratic votes	Percentage of total number of votes cast	Members elected
1871 . . . . .	124,655	3.0	2
1874 . . . . .	351,952	6.8	9
1877 . . . . .	493,288	9.1	12
1878 . . . . .	437,158	7.6	9
1881 . . . . .	311,961	6.1	12
1884 . . . . .	549,990	9.7	24
1887 . . . . .	763,128	10.1	11
1890 . . . . .	1,427,298	19.7	*35
1893 . . . . .	1,876,738	23.3	44
1898 . . . . .	2,107,076	27.18	†56
1903 . . . . .	3,011,114	31.75	81
1907 . . . . .	3,251,000	27.0	†43
1912 . . . . .	4,250,399	35.0	110

\* In the by-election in the twenty-second district of Saxony, held in 1892, a thirty-sixth member was elected.

† Later elections to supply vacancies gave the Social Democrats two additional members, making 58 in all.

† Later by-elections raised the number to 54.

One or two comments upon the vote cast are needed. The vote fell off in 1881, owing to the severe repressive measures following the Anti-Socialist Law. In 1890 the Social Democratic party became the largest in the German Empire, casting about 20 per cent of the votes. With some 15 parties in Germany, this is less significant than in a country with two great parties, but, nevertheless, it means a great deal. Another point to be considered is that the socialists do not have a number of representatives in the Reichstag corresponding with the number of votes cast. This is due to the way the electoral districts are arranged, whereby the Conservatives (largely made up of landed proprietors and other favored classes) and Agrarians elect a much larger number of members relatively.

The official organ of the Social Democratic party is the daily *Vorwärts*, of Berlin, of which also a weekly edition, called the *Sozialdemokrat*, is published. *Die Neue Zeit*, a weekly magazine published at Stuttgart, is the so-called scientific organ of German social democracy, discussing questions of principles. Both these organs represent the dominant Marxian socialism. The more conservative opportunism is represented by the *Sozialistische Monatshefte*, published in Berlin. Special mention may be made also of two illustrated comic papers, which advocate social democracy, viz., *Der Wahre Jacob* and *Der Süd-deutsche Postillon*. See WAR IN EUROPE.

**Austria.** In Austria we find a very different condition of things from that which exists in Germany. Social democracy was later in gaining a foothold in Austria, and its growth has been far slower. The situation in Austria is complicated by the race question. The Social Democrats of the German-speaking territory are organized in the Austrian Social Democratic Labor party, while Bohemia and Moravia support the Czech-Slav Social Democratic party. Each has its independent national organization.

**Hungary.** A labor party strongly influenced by the followers of Lassalle was formed in Hungary in 1868. The Marxians gained the upper hand during the following decade, however; but during the eighties the anarchists were a disturbing factor. They have, however, been reduced to insignificance, and social democracy is making advances in this Kingdom as elsewhere.

During the last decade of the nineteenth century the agitation was extended to the agricultural classes.

**Denmark.** In Denmark the influence of the social democracy is comparable to that of the same party in Germany, but, owing to the minor rôle of Denmark in world politics, the party has attracted little attention. The social-democratic agitation began in the early seventies, but it was under dishonest leadership, and the result was a collapse and temporary reaction. During the past 10 years, however, there has been a very rapid growth of social democracy under Marxist leaders. In 1898 the Social Democrats polled approximately 32,000 votes, electing 12 deputies. At the election in 1903 the Socialists elected 16 members, polled 55,479 votes, and almost wiped the Conservative party out of existence. In 1910 the party cast 98,721 votes and elected 24 deputies, and in 1913 it cast 125,330 votes and elected 32 deputies. The daily organ in Copenhagen, called the *Social Demokraten*, is said to have a larger circulation than any other paper in Denmark. One of the notable features of social democracy in Denmark is its participation in the trades-union and coöperative movements, the latter of which has made very rapid progress.

**Norway.** The social-democratic agitation in Norway has made slow progress, and it has not as yet played a prominent part in political life. In 1909 the Socialist party polled some 90,500 votes in the Storthing elections and elected 11 representatives. In 1913 the number of representatives elected was 23.

**Sweden.** In Sweden social democracy has made considerable progress in recent years and has exercised marked influence upon the labor movement. The Social Democratic party was formally organized in Sweden in 1899. The programme was Marxist in character and closely resembled that of the German Social Democracy. In the 1914 elections to the National Legislature the Social Democratic party secured 87 seats out of 630.

**Switzerland.** In Switzerland, owing to the success of political and social reforms, the social-democratic agitation has found a barren field. In 1911 the socialists elected 15 members of the National Council, and in the Legislative Assembly of Basel were represented by 43 members out of 130. The Social Democrats have, however, exercised considerable influence upon other political parties.

**Italy.** The poverty and ignorance of the masses of the Italian population and the impulsiveness of their character seemed to favor at first the growth of anarchism rather than of socialism. Under the influence of Bakunin an anarchistic agitation was started in 1872.

The social-democratic agitation began in the seventies, but it became powerful only during the last decade of the nineteenth century, having gradually succeeded, with the help of the government, in superseding anarchism, which is still a troublesome factor. The socialistic vote rose from 76,400 in 1890 to 175,000 in 1900 and 338,865 in 1909 and the number of deputies from 5 in 1893 to 40 in 1909 and 77 in 1913. The socialist press consists of one daily newspaper, *Avanti*, and a large number of periodicals appearing less frequently. A monthly, *La Critica Sociale*, and a fortnightly, *Il Socialismo*, are among the most prominent of these periodicals. *L'Asino*, a satirical weekly, has a circulation of 100,000 copies.

In Italy, as in so many other countries, we find two tendencies among the socialists: the opportunist tendency, favoring compromise measures and seeking coöperation of nonsocialists; and the orthodox Marxian tendency, uncompromising, pursuing the ultimate goal, and with little faith in reform measures which imply the continued existence of the present industrial society.

**Spain.** Social democracy effected an organization in 1882. In the last two decades the Social Democratic Labor party has made progress, and it has advanced, while anarchism, which first gained a foothold in Spain about 1870, has on the whole receded. The number of votes increased between 1891 and 1901 from approximately 5000 to over 25,000. In 1910 Pablo Iglesias, a veteran socialist agitator, was elected to the Cortes as one of the representatives of Madrid, polling 40,791 votes.

**Holland.** The early socialist agitators in Holland came from Belgium and founded a section of the International Workingmen's Association in 1868. The present socialist activity is directly connected with the agitation begun in 1879 by Ferdinand Domela-Nieuwenhuis, who founded a socialist society, which soon fell under anarchist influence and showed a strong inclination to favor extreme and violent measures.

The more conservative socialists organized a Social Democratic party upon a Marxian basis in 1894, and this party has gradually gained a dominant position among socialists, the old organization led by Domela-Nieuwenhuis having dwindled to insignificance; the anarchistic element has been practically extinguished.

The socialists elected 7 members of Parliament in 1901. The socialist vote was 39,000. In 1905 the vote increased to 65,743 and in 1910 to 82,494. The parliamentary representation remained at 7 until 1913, when it increased to 15.

**Belgium.** A socialistic association was founded in 1866, and a labor party with a mixed socialistic and anarchistic programme was established in 1868. The International Workingmen's Association had sections in Belgium, but in 1872, when the schism between the socialists and anarchists took place, the Belgian sections joined the anarchists under Bakunin. The modern social-democratic movement in Belgium may be said to date from 1876, when party groups were organized under a physician, Dr. DePaepe, who was a convert from anarchism. The present party, called Parti Ouvrier Belge, was formally established in 1885. In 1893 great socialist demonstrations took place, and a general strike was inaugurated with the purpose of securing universal suffrage. This effort was successful: and universal but unequal suffrage was granted to all males over 25. Some of the voters, on account of educational or property qualifications, now have two or three votes. A general strike involving 400,000 workers was conducted in 1913 for the purpose of ending the abuse of plural voting. It wrested from the government a pledge to take suffrage reform under consideration. In the election which took place in 1894 the socialists polled 335,000 votes and elected 32 members of the National Parliament. In 1902 the number of socialist votes cast was, in round numbers, 476,000 and the number of deputies elected 34. In the elections of 1912 the Liberals and socialists acted together, in a majority of the constituencies; accordingly the actual socialist strength is not determinable, but 241,895 socialist votes and 794,238 liberal-socialist fusion

votes were cast. The socialists seated 39 deputies out of a total of 186.

The social democracy in Belgium of course collapsed upon the invasion of that country in 1914, but its history is interesting and important because of several peculiarities. First may be mentioned the close connection with the trades-union movement. This, however, was not such a distinguishing feature of Belgian social democracy as was its connection with the coöperative movement. The socialists in Belgium had started numerous coöperative establishments which had achieved a remarkable success. More than 200 of these became affiliated with the Socialist party, thus bringing it into connection with the daily economic life of the masses. The two chief coöperative establishments were the Maison du Peuple of Brussels and the Vooruit in Ghent. The Maison had a membership of 25,000 and property exceeding in value 2,000,000 francs. These were great retail establishments, resembling the modern department store. The masses showed that they were closely attached to these coöperative stores, through which the socialist agitation was actively carried on.

There are several strong socialist periodicals in Belgium having a large circulation. The official paper published in Brussels is *Le Peuple*. *L'Echo du Peuple*, an evening issue from the office of *Le Peuple*, is also an official organ. A monthly review called *L'Avenir Social* is published.

**France.** The Socialist party in France did not gain any considerable following until after 1890. Its late appearance is doubtless due to the frequent revolutions in that country and its disordered and unsettled condition, which rendered it more favorable for anarchistic and revolutionary movements. With the firm establishment of the Republic and the lapse of a generation since the last revolution, the relatively ordered and legal means of modern social democracy have found a more fruitful soil and anarchistic tendencies have been pressed into the background. The early Utopian socialism was practically dead in 1860. The International Workingmen's Association gained some influence in France during the uprising of the Paris Commune, which, however, was only partially socialistic. The International Association did not, however, exercise any considerable influence and soon disappeared. So far as it continued to exist, it fell under anarchist influences under the leadership of anarchists like Elisée Reclus and Prince Kropotkin. A socialist paper published by a group of students made its appearance in 1876, and three years later Jules Guesde, who formerly had been anarchistically inclined, founded a Socialist Labor party in France. He was soon joined by a former comrade in anarchy, Dr. Paul Brousse. In 1889 the total socialist vote was only 91,000 in round numbers out of a total of 6,847,000 votes; two years later the vote rose to 549,000, or nearly 9 per cent of the total vote cast. This vote includes those who voted for the so-called Socialist Radicals, who, while having strongly socialistic leanings and generally acting with the socialists, may not be regarded as full socialists, inasmuch as they do not accept the entire socialist programme. In 1893 the socialists increased their strength in the French Assembly threefold, the number of deputies rising from 15 to 50. It thus became in that year a great political party. In 1902 the socialist vote was 805,000, electing 48 deputies; in

1906, 877,999, with 54 deputies elected; in 1910, 1,125,877, with 76 deputies. In 1914 the organized socialists elected 102 deputies. There were in addition 30 independent socialist deputies.

The next great event in the history of French socialism was the appointment of A. Millerand to a cabinet position as Minister of Commerce under Waldeck-Rousseau in June, 1899. This was the first time in the world's history that a socialist had attained such a prominent position in government. The acceptance by Millerand of this position gave rise to fierce dissensions within the socialist ranks. His opponents held that he had placed himself outside the control of the party by participating in the actual administration of a capitalistic government. Millerand's position, however, was sustained by Jean Léon Jaurès (q.v.). The national congress, however, backed by the international congress, discounted the acceptance by socialists of ministerial position, and by a new rule automatically excluded from the party Millerand and Briand, who accepted cabinet portfolios. Upon the outbreak of the Great European War the rule was ignored, and even the veteran opponent of ministerial participation, Jules Guesde, accepted a post in the ministry.

The socialist party in France has been disturbed throughout its history by factional strife. In 1905 the various factions were united, but it remains true that a large part of the adherents of socialist doctrine remained outside of the organization. The principal socialist publication of France is *La Petite République*, a daily with an enormous circulation. There is also a daily paper, *L'Action*, socialist, antiministerialist, and violently anticlerical. It has a large circulation. A monthly called *La Revue Socialiste* seeks to do an educational and scientific work among the French socialists like that which *Die Neue Zeit* aims to accomplish in Germany. *Le Socialiste*, the weekly organ of the Parti Ouvrier Français, and *Le Mouvement Socialiste* are also important periodicals.

**Russia.** For a half century most radical and revolutionary agitation of one kind or another has been carried on in Russia, and the two most familiar names among the international leaders of anarchism, Mikhail Bakunin and Peter Kropotkin, are those of Russian exiles. Early in the second half of the nineteenth century this agitation took the name of nihilism (q.v.), which was a kind of political anarchism rather than economic anarchism. One aim which has in the past been prominent in Russia among radical economic reformers is to connect social and economic reconstruction with the Russian agricultural village called the mir (q.v.). It has been hoped by these leaders that Russia could pass directly from the early stage of economic development into socialism, without passing through modern capitalism as an intermediate stage. During the past few years, under the leadership of George Plekhanoff, a resident of Switzerland, Marxian socialism has made some progress. The socialists, having no field for political activity, turn their attention to labor agitation, and it is said by them with apparent truth that the great strikes in Russia during recent periods have to no inconsiderable degree been an outcome of modern social democracy. The socialists played an important part in the revolutionary activities of 1905 and following years, and at one time it is asserted 30,000 members of the party were political prisoners. In the second Duma (1907)

132 socialists were elected out of a total of 440. In the 1912 Duma elections only 8 Social Democrats were returned.

The entire socialist activity is secret, and no names of Russians living in Russia can be mentioned. The agitation in large part proceeds from foreign countries, and the socialist literature is smuggled into Russia and secretly circulated. Russia is regularly represented at the International Socialist Congress.

**England.** While socialist ideas probably have as much influence in England as in any country, and possibly even a greater influence, they find expression rather in a molding of the thought of other political parties than in any distinct socialist party. The chief power of socialism has been seen in the social reforms which have been accomplished in England during the past 20 years. There are at present three organizations in England which may be regarded as at once political and socialist. There is first the Fabian Society (q.v.), whose members aim not only to carry on a propaganda for socialist thought, but to promote the election of socialists in any way which may seem most feasible at the proper time and place. It is essentially an opportunistic organization in its practical tactics. There is next the Independent Labor party, formed in January, 1893, the object of which is "the collective ownership and control of the means of production, distribution, and exchange." Finally, there is the Social Democratic Federation, among whose adherents H. M. Hyndman (q.v.) and H. Quelch are prominent. This latter organization represents Marxist socialism in England and is the oldest body, dating from 1881. In this connection special mention must be made of the Labor Representation Committee, which seeks to promote "the representation of the interests of labor in the House of Commons."

The socialists claim that they had about 50,000 votes in 1900. In 1910 the entire socialist vote in England was 373,000. The parliamentary representation was 40. In local elections socialists have frequently been successful, and for some time the London County Council has been to a very appreciable extent under the influence of socialists. It may be said that the greatest trade unions have to some extent been brought under the influence of socialism. This is seen in the adoption by the Trade Union Congress at Belfast in 1893 of a resolution demanding collective ownership and operation of industries—in other words, pure socialism. This can be interpreted to mean more than it really does. It indicates a disappearance of avowed hostility to socialism on the part of trade unionists; it shows that the name "socialism" is no longer feared and that it meets with a certain sympathy. The trade-union movement has in England become in the main indifferent to active socialism, but may be described as having mild socialist inclinations.

Hyndman and Quelch have been mentioned as leaders of the Social Democratic Federation. F. Belfort Bax may also be mentioned as prominent in this group. The *Social Democrat*, a monthly journal, and *Justice*, a weekly, edited by Quelch, are organs of the Social Democratic Federation. Connected with the Fabian Society are such names as Mr. and Mrs. Sidney Webb, G. Bernard Shaw, and Edward R. Pease. The organ is the *Fabian News*. Keir Hardie and J. Ramsay MacDonald are prominent names among the members of the Independent Labor party, the organ of which is the *Independent Labor Party News*,

which, like the *Fabian News*, is a monthly periodical. Robert Blatchford, the editor of the *Clarion*, is without special affiliations for any one of these three groups.

**Canada.** A Canadian Socialist party was organized in 1901. It was narrowly Marxian in creed and never attained any considerable following. In 1911 a Social Democratic party was formed which had a membership of about 3000 in 1912. There is also a Labor party, much under socialist influence. It has one representative in the Dominion Parliament.

**The United States.** Although communism (q.v.) gained an early foothold in the United States, it exercised practically no influence upon the movement now represented by the Socialist parties. American socialism proper begins with the German influence. As a result of the political disorders of 1848 many men of learning and character went to America from Germany as refugees. There were radicals among them who took the leadership in the establishment of communism of a new type in America. Among them we may mention Wilhelm Weitling (q.v.), a German tailor, who started a German newspaper called *Die Republik der Arbeiter*, and organized an *Arbeiter Bund*. He was essentially a Utopian socialist, and had plans for the establishment of a communistic settlement, and was for a time connected with one in Iowa. Nevertheless, his thought was more in line with modern socialism. Weitling lived until 1871, and was at the last somewhat interested in the *Internationale* of Marx. Next, mention may be made of the German gymnastic unions (*Turnvereine*), which, in the early days, were avowedly Socialist. The first socialist *Turnverein* was established in New York in 1850. The *Turnvereine* formed an organization called the Socialist Gymnastic Union (*Sozialistische Turner Bund*), and in 1850 the name Socialist Gymnastic Union was adopted. Since the Civil War the socialistic character of the *Turnvereine* has very largely but not entirely disappeared.

In 1857 a club of communists was formed. In 1868 the followers of Lassalle held a meeting, the purpose of which was to establish a Social Democratic party, and an organization was effected in New York City. In 1869 the party became affiliated with the International Workingmen's Association. Several sections of the *Internationale* were formed in the United States, and in 1872 the seat of the *Internationale* was transferred to New York City. Scattering sections existed here and there for a few years. The National Labor Union formed a party called the Labor Reform party in 1868, and the socialists supported this, but its life was of short duration. The socialists formed a Social Democratic Workingmen's party at a convention held in Philadelphia in 1874, and in 1877, at a convention in New Jersey, they adopted the name Socialist Labor party, which is still preserved. The party for a long time had much trouble with the anarchists. The convention of the Socialist Labor party in 1881, in New York City, witnessed a rebellion of the anarchists against the party, and one of the anarchist leaders, Justus Schwab, started a paper called the *Anarchist*. Johann Most went to America in 1882 from London, having previously been expelled from the Social Democratic party of Germany. The agitation of Most produced a crisis, and in 1883, in the convention at Baltimore, the socialists decided not to connect themselves in any way with

the anarchists, who had effected an organization at Pittsburgh in the same year.

The next important events in the history of the Socialist Labor party are connected with the candidacy of Henry George in 1880 for the mayoralty of New York City and in 1887 for the governorship of New York. George was nominated by what was called the United Labor party and ran against Abram S. Hewitt and Theodore Roosevelt. The votes received by the three candidates were as follows: Hewitt, 90,552; George, 68,110; Roosevelt, 60,435. The Syracuse convention of the Union Labor party, 1887, when George was nominated for the governorship of New York, repudiated socialism. This formed an epoch in the history of American socialism, and in 1888 the Socialist Labor party decided to have no affiliations thereafter with any other party, but to nominate an independent ticket and vote for that without compromise and without any bargains with other parties or factions of parties. It is from this time that organized political socialism has made progress in the United States.

We must next take up the introduction of distinctively American influences into political socialism in the United States. Dr. Daniel De Leon has long been one of the most influential factors in the Socialist Labor party. Although not an American by birth, he was trained at Columbia University. Laurence Gronlund (q.v.), a Dane by birth but naturalized in the United States, wrote his *Cooperative Commonwealth* in 1884, and this helped spread socialism among native-born Americans. Edward Bellamy (q.v.), of long American ancestry, wrote *Looking Backward* in 1888. Bellamy's socialism was, as has already been stated, called nationalism, and the clubs organized were called nationalist clubs. As a distinctive factor nationalism soon ceased to exist. The specific work which Bellamy accomplished was the Americanization of socialism, in the sense that he helped the American people to understand its significance and won over a great many to its support. In 1893 the *Coming Nation* was established at Greensburg, Ind., by J. H. Wayland. Wayland was for a time influenced by the older so-called Utopian socialism and helped establish Ruskin, in Tennessee, a short-lived communistic settlement. Later he moved to Kansas and there established the *Appeal to Reason*. It is now published at Girard in that State. The establishment of the American Railway Union in 1893 and the Pullman strike in the following year are epoch-making in the history of American socialism. Early in 1897 Eugene V. Debs announced his conversion to socialism, and he and Victor L. Berger of Milwaukee were largely instrumental in establishing the Social Democratic party. After 1899 there were dissensions in the Socialist Labor party, terminating in a serious split. The socialists who left the old party joined forces with the rival party and formed what is now known as the Socialist party, except in Wisconsin and New York State, where, for legal reasons connected with the laws concerning the ballot, it is still called the Social Democratic party. Recently there has been organized by Pennsylvania socialists a new Socialist Labor party, which hopes to effect a union of all socialist parties.

It is interesting to trace the vote received by socialist parties beginning with 1888, when an independent ticket was nominated in New York City and the resolution was adopted to form no

alliances with other parties. In this election the vote received was 2068. In 1890 in New York State alone the party received 13,331 votes. In 1892 the socialistic vote of Connecticut, Maryland, Massachusetts, New Jersey, and New York was 21,159. In 1894 the party extended its influence to the Middle States and in Connecticut, Iowa, Massachusetts, Missouri, New Jersey, New York, Pennsylvania, and Rhode Island received 33,133 votes. In 1896 the number of votes was 36,564. In 1898, in eighteen States, the Socialist Labor party received 82,204 votes, and the Social Democratic party, which was organized in 1897, 9545 votes, largely in Massachusetts, making a total of 91,749. In the presidential elections of 1900 the Socialist party received 97,730 votes and the Socialist Labor party 33,450, making a total of 131,180. In 1902 State and congressional elections the Socialist party received 229,762, and the Socialist Labor party received 53,763, making a total of 283,525. The Socialist Labor party vote declined to 29,000 in 1912. The progress of the Socialist party is indicated by the presidential vote for 1904, 402,321; 1908, 421,520; 1912, 901,361.

The first socialist elected to Congress was Victor Berger, from Milwaukee, 1910. In the 1912 elections he was defeated, but in 1914 another socialist, Meyer London, was elected from New York. Sporadic victories in local elections have characterized the history of the party since 1898. The most significant of these was the Milwaukee elections of 1910, which placed the administration of the city entirely under socialist control. In 1911, and again in 1915 a socialist was elected mayor or Schenectady.

**During the War and After.** *International Conferences.* The general effect of the beginning of war on socialism was to disrupt the international organization and destroy for the time being the world-wide solidarity of the Socialist movement. Socialists throughout the world felt that something should be done to restore as early as possible the international organization. In September, 1914, the Socialists of the United States sent appeals to the Socialists of Great Britain, Holland, Italy, Sweden, Denmark, France, Germany, Austria-Hungary, Switzerland, and Belgium, to hold an international Socialist Peace Conference. Nothing came of this, however, because the Socialists of the belligerent nations could not possibly attend such a conference. The Scandinavian and Dutch Socialists held a conference in January, 1915. Sixteen delegates attended. Capitalism, militarism, imperialism, and secret diplomacy had caused the war, declared the conference. All Socialists were called upon to help formulate just peace proposals, to work for the democratization of diplomacy, to labor for ultimate disarmament, and to urge their several governments to initiate pacific negotiations.

A conference of the Socialists of Allied countries met in London in February, 1915. Victory rather than immediate peace was the chief concern of this gathering. Secret diplomacy and the private manufacture of arms for profit must be done away with. Neither of the conferences accomplished anything toward renewing international solidarity.

On Sept. 15, 1915, Russian, Dutch, Polish, Swiss, Norwegian, Swedish, French, German, Bulgarian, Rumanian, and Italian Socialists met at Zimmerwald, Switzerland. A manifesto was issued to the "proletariat of all nations."

Capitalists and "jingo" were blamed for the war. The workers of the world must cry out against war, they must condemn the ruthless violation of Belgian neutrality and demand the restoration of Belgian independence, and they must lift their voices in warning against any annexations of unwilling peoples at the close of the war. The British Socialists were conspicuous by their absence from this conference. The British government had refused to grant passports to the prospective delegates from the Independent Labor Party and the British Socialist Party. A reunion of the Zimmerwald delegates was held at Kienthal, Switzerland, April 24-30, 1916. Forty delegates were present and nothing of a constructive value was accomplished.

On July 30 and August 1 and 2 a conference of neutral Socialists was held at the Hague. The delegates were affiliated with the International Socialist Bureau and represented Denmark, Holland, Sweden, the United States and Argentina. Resolutions were passed laying the blame for the war on the capitalist system, advocating free trade, freedom of the seas, and democratic decentralization of power, and condemning proposals for a trade war after the war. As to the Socialists in the belligerent countries, they remained bound for the most part by national ties.

On May 30, 1917, the Russian Council of Workmen's and Soldiers' Delegates appealed for the reassembling of the International and for the calling of a peace conference. The question immediately arose in the Entente countries as to whether delegates should be given passports or not. France definitely decided not to grant passports on the ground that the war must be won on the battlefield and that the peace must be for the interests of all France and not for any one party. The attitude of the governments of Great Britain and France was virtually the same and passports to delegates were refused. Consequently little was accomplished at Stockholm. On February 21-23, 1918, an Inter-Allied Labor and Socialist Conference was held in London, attended by delegates from the Labor and Socialist parties of England, France, Italy, Belgium, Portugal, and South Africa. This document endorsed the four principles of President Wilson and the substance of the programme of the British Labor Party. (See SUPPLEMENT.) Another conference of the Socialist parties representing the Allied countries was held in London in September, 1918. This approved the effort of the Allied governments to give aid to the people of Russia.

On Feb. 2-9, 1919, an International Socialist Conference, under the auspices of the International Socialist Bureau was held at Berne, Switzerland. Twenty-six countries were represented by 94 delegates. Resolutions were passed demanding that the League of Nations should endeavor to prevent future wars; that it should abolish all standing armies and bring about disarmament; create an International Court; enforce decisions by economic weapons; protect small nations; provide for free trade; and enforce the International Labor Charter. Self-determination of all nationalities was advocated and annexation and political and economic spheres of influence were condemned.

An International Communist Conference was held at Moscow, March 2-6. Twelve countries were represented. It decided that a Third In-

ternational should be immediately formed. The subjects discussed included the programme of the Communist International; the Dictatorship of the proletariat; the attitude toward other Socialist parties and toward the Berne Conference; the location of the Bureau of the new International Conference; the present European situation and the policy of the Allies. The manifesto of this Communist Conference declared that its members were carrying out the programme that had been drawn up by Karl Marx 72 years before.

In August, 1920, a congress of the Second International (see LABOR CONGRESSES) was held at Geneva. Twelve European countries were represented. It declared emphatically against the acts and programme of Lenin and Soviet Russia and incorporated the British features and principles (see SUPPLEMENT).

The Congress of the Third International was held at Moscow, June 17 to July 12. Forty-three countries were represented by several hundred delegates. The Russian Soviets were able to retain control of the conference and dictate its actions, but only by a bare majority. At a secret session the congress found that the situation in Russia was critical and that Bolshevik propaganda had not succeeded in France, England, and America, while in Norway and Sweden the Communists had barely effected an organization. The congress determined to carry out propaganda in the British colonies.

**Germany.** The war split the German Social Democrats into two well-defined groups. The more radical members of the party became thoroughly out of sympathy with the war policy of the government and unwilling to support longer what they called a war of conquest, but the majority of Social Democratic deputies in the Reichstag were heartily in favor of the war and of compelling the radical minority to remain within the party. One of the leaders of the minority Dr. Karl Liebknecht steadfastly refused to vote for the war credits and tried at every turn to embarrass the government. He was ultimately read out of the party by the patriotic majority. The latter also repudiated the party organ, *Vorwaerts*, for rebelling against party discipline. Liebknecht was later arrested and punished by the government for an inflammatory address during the May Day celebrations in Berlin. In 1916 the split in the party came to a head. After a statement by the Finance Minister in March concerning the success of a war loan and the harmony that prevailed throughout the country, Haase, a leader of the radical minority, declared that the Socialists detested the war as due to the greed of German capitalists. The patriotic majority of the party expelled him from its membership by a vote of 58 to 33. The dissenting group broke away from the party and formed the Socialist Union of Labor. At the time the Stockholm conference was talked about, the Austrian and German Socialists drew up a peace programme of which the main points were as follows: No annexations and no indemnities; the Slav countries of the South and the Austro-Hungarian crownlands to remain in the dual monarchy, but the Socialists to support the efforts of the population to obtain self-government; Finland and Russian Poland to form independent states, and Galicia to be self-governing under the sovereignty of Austria. The annexation of Belgium was opposed and an independent Serbia favored;

which joined to Montenegro should have an outlet to the sea. No mention was made of Alsace-Lorraine. The German minority Socialists included in their peace aims the restoration of Belgium and Serbia, an independent Poland, and a plebiscite for Alsace-Lorraine. After the Armistice and the abdication of the Kaiser, the Majority Socialists by forming a coalition with the Democrats gained control of the government under the leadership of Scheidemann. In January, 1919, there was a violent struggle between the new government and the radical minority known as the Sparticides. The government was completely successful. Despite this, however, the radical group seemed to gain in power. A congress of the Majority Socialists was held in 1920. This congress bitterly attacked the Peace Treaty. A conference of the Independent Socialists held the same year (October) decided in favor of adherence to the Moscow Third International. A strong minority of the Independent Socialists were opposed to the Bolshevik system and left the conference and went into separate session, where they passed a resolution to the effect that they were in sympathy with the aims of the Bolsheviks, and opposed to its policy of terrorism and destruction. A National Congress of the Majority Social Democrats held at Goerlitz, Sept. 18-25, 1921, indicated plainly that the ultimate aim of the party was a cooperative commonwealth.

**France.** The French Socialists were almost unanimously in favor of the war when it first started. They regarded the war as a struggle of democracy against militarism. A meeting of the National Council of Unified Socialists in July, 1915, showed an overwhelming majority in favor of supporting the war against Germany, and only a minority in favor of immediate peace. The meeting passed a resolution with only one dissenting voice, expressing the determination of the French Socialists to fight against German imperialism. The action of three Socialists who had taken office in the War Cabinet was approved by a later meeting of the Council. By 1916, a small minority against the war and in favor of a resumption of international socialist communication came into existence, but was unable to accomplish anything. A Paris conference held toward the close of the year 1916, adopted a resolution calling upon the government to pursue a more vigorous policy, both military and civil, in the conduct of the war and to draw upon all the resources of the nation in order to insure the earliest possible conclusion. A conference held in Bordeaux in October, 1917, passed a majority resolution which declared for the Stockholm Conference, for national defense, for voting credits for the war and for conditional participation by Socialists in the government. A minority resolution was also passed which stated that the Socialists were loyal to national defense but did not approve voting credits to the government if the war ceased to be a defensive war. They also declared in favor of a peace without annexations or indemnities. At a conference held in Paris, Oct. 6-10, 1918, the Socialists voted down the above-mentioned resolution of the majority and adopted the resolution that the minority had adopted the previous year. In August, 1919, the French Socialists decided not to take part in the Third International at Moscow. In the general elections of 1919, the French Socialist vote increased

about 40 per cent, but the number of delegates decreased from 105 to 55 on account of the system of proportional representation. In 1920 a French Socialist congress which met at Tours adopted a very radical platform and voted to join up with the Third International at Moscow.

**Great Britain.** After the outbreak of the war many of the prominent British Socialists adopted the viewpoint of fighting the war against Germany to the bitter end. There were three distinct groups in Great Britain, the British Socialist Party, the Independent Labor Party, and the Fabian Society. Generally speaking these three groups adopted a very pacifistic attitude and insisted upon an early peace and the realization of their principles. See SUPPLEMENT.

**Italy.** The Italian Socialists were bitterly opposed to the entrance of Italy into the war. They declared that it was against the will of the people. They saw in it a cause, however, for new and stronger impulses to the class struggle. In 1919 the Socialists voted to support the Moscow International. This party was opposed to recognizing President Wilson when he visited Italy at the time of the Peace Conference. On July 1, 1919, a general strike was called and carried out as a protest against the Russian blockade. Many towns were taken over and Soviets set up before order was restored. SUPPLEMENT will give additional information on Socialism as it affected the bellum and post bellum period.

**United States.** After the outbreak of the war there was dissension among many of the leaders of the American Socialists. Mr. Hillquit asked the United States to urge peace upon the European belligerents and to set them the example of a nation at peace with the world because they are at peace with it. Mr. Debs was not in favor of urging immediate peace but of waiting for the proper time for intervention. In the presidential election campaign of 1916 the Socialists polled 750,000 votes as compared with 901,000 in 1912. After the United States entered the war, the Socialist Party objected to the Selective Service Act (see SUPPLEMENT), and other features of the war programme. As a result of this attitude many of the leaders left the party. Others were arrested and imprisoned for their attempts to delay or prevent the carrying on of the war. Eugene V. Debs was the most notable example of the latter class. His sentence was commuted by President Harding on Nov. 23, 1921. On Sept. 24, 1917, the Socialist Party National Council went out of existence and was superseded by the National Executive Council consisting of four members, Morris Hillquit, Victor Berger, John M. Work, and Anna A. Maley. In 1918, there was formed the Social Democratic League which was composed mainly of those Socialists who opposed the St. Louis anti-war platform and who believed that the crushing of autoeracy and militarism was a *sine qua non* of the success of their cause. Very little was accomplished by this new organization. In 1919 there were further splits in the Socialist ranks. Many of the more radical members broke away and formed the Communist and Communist Labor parties (1920). The 1919 Socialist convention declared that the Second International ceased to operate after the outbreak of the war, and that it decided to adhere to the Third International at Moscow. The expulsion of five Socialist members from the

legislature of the State of New York, their subsequent reelection, and the second expulsion of three of them caused country-wide interest and brought forth many protests from prominent non-Socialist leaders. The Socialist vote in the presidential election of 1920 was 919,799. This was considerably below the estimate of the Socialist leaders before the election.

**SOCIAL LEGISLATION.** A term used to designate the growing body of laws designed to remedy evils incident to or intensified by modern industrialism. It is also frequently used, in a broader sense, to include laws for social amelioration in other directions. See SOCIAL INSURANCE; WORKINGMEN'S INSURANCE; OLD AGE PENSIONS.

**SOCIAL PSYCHOLOGY.** The science of those modifications of consciousness which result from the reciprocal relations of individuals in a community. As used at present the term includes only human groups or societies. Social psychology finds no new mental processes, but it examines a host of new functions which the individual consciousness fulfills by virtue of its relation to other minds more or less like itself. This branch of psychology is to be distinguished from the science of sociology, which deals with the formation, structure, and development as well as the practical betterment of society. Sociology studies society objectively as an organization with certain laws of growth and change. Social psychology, on the other hand, regards the phenomena of society subjectively, i.e., it studies the springs of action which determine the movements of society and also the conscious modifications which individual minds produce in one another. It inquires into the state of mind in a mob and the causes which produce it: the mental disposition of the criminal and the motives which lead him to criminal acts; the mental characteristics of different peoples and races; the effects of climate and of scenery upon the temper of a community; the analysis of imitation, of invention, and of suggestion, and the part that these factors play in developing and maintaining society. The problem of social psychology may be regarded either genetically or statically. One may trace the development of society by the interpretations of language, religion, myths, customs, arts, and laws in various stages from the earliest primitive peoples down to the present time. Such an investigation yields both psychological and sociological results. The problem which is of interest to the social psychologist concerns the modification of perception, idea, feeling, emotion, sentiment, and action which is traceable directly to the social environment, and the reciprocal effect of these mental formations upon the community as a whole. One may also take society as one finds it at present and analyze the mental factors which control the complex interrelations of men. See CUSTOM; LANGUAGE; LAW; MYTHOLOGY; SOCIOLOGY.

*cial Psychology* (ib., 1908); William McDougall, *Introduction to Social Psychology* (ib., 1910); Gustave Le Bon, *The Crowd: A Study of the Popular Mind* (7th ed., ib., 1910); W. M. Wundt, *Völkerpsychologie* (Leipzig, 1911-14).

**SOCIAL SCIENCE.** See SOCIOLOGY.

**SOCIAL SCIENCE ASSOCIATION, AMERICAN.** A society for the study of social questions. It was organized in Boston, Mass., in 1865 and meets annually in such cities as may be selected. Its work is classified in five departments: education and art, health, trade and finance, social economy, and jurisprudence. Its membership is about 1000, of whom 30 corresponding members are distinguished sociologists of England and continental Europe. The association publishes the annual *Journal of Social Science*.

**SOCIAL SERVICE, AMERICAN INSTITUTE OF.** An American educational and research society, organized in New York, in 1898 by Josiah Strong and William H. Tolman. Its object is social and industrial betterment. Its method is to place human experience on file so as to make it available for all who wish to profit by the experience of others. Its functions are: (1) to gather facts bearing on social conditions, and whatever is being done to improve them; (2) to interpret these facts by learning their causes and effects; (3) to disseminate the resulting knowledge in every possible way for education of public opinion. Awards for exhibits in social economy have been received at international expositions as follows: Grand Prix, Paris, 1900; Grand Prize, St. Louis, 1904; Grand Prix, Liège, 1905; Grand Prix, Milan, 1906.

**SOCIAL SETTLEMENTS.** The name given to those houses, situated in the poorer districts of certain great cities, where educated men and women live that they may come into contact with the poor and better the conditions of that class. The social-settlement movement represents an attempt to establish closer relations between the higher and lower social classes, with the aim of giving to the poor opportunities for culture, while securing for the rich a broader view of life through closer contact with the people. Many settlements have become outposts for other institutions, social observatories, and statistical laboratories. The movement originated in the enthusiasm of certain Oxford students, influenced by the philosophy of Dr. Arnold and Frederick D. Maurice and by Thomas Hill Green, who felt the need of a better understanding of the life of the people.

In 1867 Edward Denison, a wealthy student, began to work in the parish of St. Philips in Stepney. Early death prevented him from carrying out his plan of establishing homes similar to the present settlement. In 1875 Arnold Toynbee, then tutor at Oxford, spent his summer in Whitechapel, where he became a leader among workmen. He too met an early death, but his influence was so strongly felt that the first settlement was named after him. Toynbee Hall was founded in 1884 by Rev. Samuel A. Barnett, in whose parish Toynbee had worked. The movement spread rapidly, and by 1890 there were promising university settlements in London, Glasgow, and Edinburgh. In the United States Hull House (Chicago) and the College Settlement in New York City were opened in October, 1889. The Neighborhood Guild of New York, a forerunner of the settlement, now took on this new form as the University Settlement.

The revised bibliography (see below) lists 44 settlements in Great Britain, 101 in the United States, one regular settlement and several institutions with settlement activities in Paris, one in Berlin, and several in Holland. The movement has even spread to Japan, India, and New South Wales. The larger settlements are usually managed and supported by regularly incorporated associations. A head worker, who receives a salary, is engaged. The expenses are met by money raised in various ways. Buildings and special equipments are obtained by gifts. In order to create independence a nominal fee is charged for some classes. A characteristic feature of the settlement is residence, more or less temporary, on the part of the workers, both volunteer and paid. Except the head worker and occasionally an assistant, the residents, however, pay their expenses.

The activities may be summed up as follows: 1. Physical. Gymnasium, baths, military drill, baseball, basket ball, and playgrounds are provided. Efforts are made to improve the sanitary conditions of the neighborhood. Many settlements have summer homes. 2. Educational. As an educational agency the settlement maintains circulating libraries, reading rooms, and home libraries; lectures; musical instruction; art instruction: classes for those who desire business training and law, for those whose education has been neglected, or for foreigners to learn English; for the study of literature, history, and economics; for industrial training, including domestic service, kitchen gardening, dress-making, etc. 3. Aesthetic. Special picture exhibits and concerts are given, and pictures are loaned. Encouragement is given to the growing of plants and to other methods of beautifying individual homes. 4. Religious. Religious instruction is usually avoided, although Sunday talks, concerts, or open discussions are frequent. A few settlements—as the Chicago Commons or Oxford House—aim to exert a religious influence. 5. Philanthropic. In this field the settlement aims to cooperate with existing organizations. Relief is very seldom given except as a personal matter. A dispensary, a day nursery, or an employment bureau is, however, frequently attached to a settlement. Flower distributions are made, and the University Settlement in New York cooperates with a model pawnshop and a legal-aid bureau. 6. Social. Numerous clubs are established for adults—debating, athletic, and political clubs; dramatic and literary clubs; and all manner of clubs for girls and boys. Women's clubs and mothers' meetings are common.

Additional features are the stamp savings bank for children, coffeeshouses, the publication of a newspaper or bulletin, and the promotion of boarding clubs, especially for working girls. Some settlements are especially interested in work with children or boys; others try to reach families or men or to Americanize a foreign element. Some are distinctly homes; others are institutional. The settlement workers are interested in the labor problem, and the settlement is often a headquarters for economic discussions or occasionally a meeting place for labor organizations. Civic interests are stimulated, and residents sometimes hold positions on State and municipal boards. From time to time investigations are made from the settlement, and scholarships are sometimes given to further such work. See HULL HOUSE; TOYNBEE, ARNOLD; UNIVERSITY EXTENSION.

**SOCIAL WAR** (Lat. *bellum sociale*). A desperate struggle between Rome and her Italian allies (*socii*), which lasted for two years (90–88 B.C.). The races of Central Italy—the Samnites, Pælignians, Marsians, and Lucanians—had long been bound to Rome by a forced allegiance without enjoying Roman citizenship. The hardy mountaineers chafed under this handicap and when, in 90 B.C., their Roman champion, M. Livius Drusus (q.v.), was murdered for his attempted reforms, they rebelled against Rome, and aimed at a confederation of all Italy to crush the power of Rome. The union was to be called *Italia*; its capital was to be Corfinium, in the Pæligian country, under the new name of Italica, and its government was to be a republic administered by two elective consuls. Their armies were successful for a time, and Rome met reverses; but, by giving her coveted citizenship to those allies who remained loyal and promising it to such as would return to allegiance, she succeeded in breaking the strength of the revolution. But, though the Italians lost their independence, they gained their original demands, for they were enrolled in eight new Roman tribes and soon became assimilated to the Roman body politic. From the part borne by the Marsians in this struggle it is often called the Marsian (Marsic) War.

**SOCIAL WORK AT KRUPP FOUNDRIES.** See KRUPP FOUNDRIES, SOCIAL WORK AT.

**SOCIÉTÉ DES CONCERTS DU CONSERVATOIRE**, sô'syâ'tâ' dâ kôn'sâr' dÿ kôn'sâr'-vâ'twâr', LA (Fr., the society of the concerts of the conservatory). See CONCERTS DU CONSERVATOIRE.

**SOCIÉTÉ EN COMMANDITE**, ân kôm'mân'-dêt' (Fr., limited liability company), or LIMITED PARTNERSHIP (see PARTNERSHIP; LIMITED LIABILITY). An expression used for at least two centuries in France as the name of a partnership in which one may advance capital without taking charge of the business or becoming liable as a true partner for its debts. The term owes its origin to the old meaning in the commercial nomenclature of France of the word "command," which was applied to one person authorizing another to transact business for him. The working partner had a *commande* from him who merely advanced capital. This form of partnership existed in Louisiana while it was a French dependency and was continued after it became a part of the United States; but New York was the first common-law State to adopt this institution. That was done in 1822, and now limited partnerships are authorized by statute in most of the States. They do not exist in England.

**SOCIETIES** (Lat. *societas*, from *socius*, companion, associate). Organizations of individuals for the attainment of a common end through common action. Probably the oldest forms of organization are the cult societies,

which are found among many primitive tribes, as, e.g., the Duk-Duk (q.v.) of the island of New Britain in the Pacific, or the Mumbo Jumbo societies of west Africa. These are mainly religious in character, with certain political characteristics, and possessing a ritual and the feature of secrecy. Far advanced are the religious societies of the classic world, like the Eleusinians of the Greeks or the priestly colleges of the Romans. Further still we have the organizations which arose with the Christian Church and which aside from the purely monastic aggregates included associations formed for secular purposes (see BROTHERHOODS, RELIGIOUS), as the care of sick (See HOSPITALERS), building of bridges (see BRIDGE-BUILDING BROTHERHOOD), protection of pilgrims, and a combination of some of these duties as exemplified in the great orders (q.v.)—the Templars, or the Knights of St. John of Jerusalem (qq.v.). Preëminent among societies formed for the defense of faith stands the Society of Jesus (see JESUITS).

Political organizations begin early and take the form of public associations working for their purposes in the open (e.g., the Anti-Corn Law League), or secret associations wherever the objects or methods of the societies are regarded with disfavor by governments or are hostile to government. The latter type would include the great revolutionary societies which have played an important part in European affairs, especially since the beginning of the nineteenth century. See BURSCHENSCHAFT; CARBONARI; FENIAN SOCIETY; NIHILISM; YOUNG ITALY; ETC.

The primitive cult societies were largely social in their nature, and social organizations constitute at present an important class of societies. Such are clubs (q.v.) and college fraternities (see FRATERNITIES, AMERICAN COLLEGE), wherein there is no further aim than the bringing together a number of individuals of congenial tastes. Or the interests of the association may centre in some one line of amusement or single pastime, as with athletic organizations, sporting clubs, etc. (See ALPINE CLUBS.) Where the element of sociability is supplemented by some attempt at self-instruction in art, etc., we have the large class of musical societies, choral, literary, or art societies, etc. Noted for broadness of scope in combining social, educational, and religious elements is the Young Men's Christian Association (q.v.). The social element is overshadowed by a common professional interest in the class of organizations known specifically as learned societies, embracing every field of science and liberal learning. (See, e.g., ACADEMY; HISTORICAL ASSOCIATION, AMERICAN; INSTITUTE OF FRANCE; ROYAL SOCIETY; ETC.) Of great importance, in the United States especially, are the fraternal organizations combining sociability and mutual assistance rendered either in an informal way, as among the Freemasons (see MASONS), or in a more definite form, as by life, sickness, and accident insurance, as practiced by various other organizations. As typical of the great class of benevolent and fraternal societies, see ELKS, ORDER OF; ODD FELLOWS, INDEPENDENT ORDER OF; PYTHIAS, KNIGHTS OF; ETC. Finally, mention must be made of a class of societies devoted to the amelioration of social conditions and directing their efforts to the advancement of the general welfare or to the cure of some spe-

cific evil in society. For the first type, see **BOYS' CLUBS**; **CHARITY ORGANIZATION SOCIETY**; **WORKINGMEN'S CLUBS**; **WORKINGWOMEN'S CLUBS**; **ETC.** The second include the various temperance societies in the United States. See **TEMPERANCE**; **WOMAN'S CHRISTIAN TEMPERANCE UNION**. See also **PATRIOTIC SOCIETIES**.

**SOCIETIES FOR ETHICAL CULTURE**, **THE**. The first society for Ethical Culture was formed in New York City in May, 1876, by Prof. Felix Adler and several associates. The purpose of the movement was to provide a centre for persons who had lost their attachment to the traditional creeds and desired to aid in promoting the moral development of the individual and of society. A second society was formed in Chicago in 1882, a third in Philadelphia in 1885, and a fourth in St. Louis in 1886. A few years afterward the first society in London was organized by Dr. Stanton Coit. Other societies have since been formed in England, Germany (where there are 16), Austria, Italy, and Japan. The most important of these societies are those in the United States, England, and Germany. The societies in America seek less to gain adherents than to establish their principles and perfect their organization. Not affirming any creeds and not hostile to any, the Society for Ethical Culture teaches that moral ends are supreme above all human ends and interests and that the authority of the moral law is immediate and not dependent upon religious beliefs or philosophical theories. Meetings are held on Sundays and are devoted to addresses with exclusion of audible prayer and all forms of ritual. Special importance is attached to the ethical training of children, and important schools have been established in New York and other cities. The New York Ethical Culture School was the first to introduce manual training as a regular branch of the curriculum in elementary schools. Young men's societies, women's conferences, Sunday ethical classes, and the like come within the sphere of activity of the societies. The membership of the societies in the United States in 1915 was about 2500. Dr. Felix Adler has been president of the New York Society since its organization.

**Bibliography.** Felix Adler, *Creed and Deed* (New York, 1877); W. M. Salter, *Ethical Religion* (Philadelphia, 1889); Stanton Coit, *Neighborhood Guilds* (New York, 1892); W. L. Sheldon, *An Ethical Sunday School* (ib., 1900); Felix Adler, *The Moral Education of Children* (ib., 1901); id., *Life and Destiny* (ib., 1903); id., *The Religion of Duty* (ib., 1905); id., *The Essentials of Spirituality* (ib., 1905); Washington Gladden, *Social Salvation* (Boston, 1909). *Ethical Addresses* (pamphlets) are issued by the American Ethical Union (Philadelphia, monthly). *The International Journal of Ethics* (Philadelphia, quarterly), while not the official organ of the societies, owes its origin and main support to them. *Ethics* (London, weekly) and *The Ethical World* (ib., bimonthly) are the chief English publications, and *Ethische Kultur* (Berlin, weekly) represents the German movement.

**SOCIETY** (from Lat. *societas*, from *socius*, a companion). A naturally formed group, as a tribe, a village, a nation, organized to achieve the common good—a community, a commonwealth. The basis of society is mental agreement and pleasure in association. An entire

population occupying a defined territory becomes, through developing communication and assimilation, increasingly like-minded. Through developing coöperation, cultural, economic, legal, and political, it becomes highly organized. Such a socially developed and organized population is a natural society, and it is within a natural society that all lesser or subordinate societies appear, as incidents of its evolution. These are of two broadly distinguished kinds, the component and the constituent. The component society is a group in which both sexes and all ages dwell together. The name is indicative of the fact that all the larger natural societies, like modern nations, are compound, having been produced by the federation of smaller component groups. The constituent society is an association of selected persons, formed to carry on a particular work. It represents the principle of division of labor, of specialization. The name is expressive of the fact that society as a whole is constituted of such specialized associations. Collectively they are the social constitution. They include all societies for amusement, religion, education, philanthropy, business, the promotion of justice, and political activity. See **SOCIOLOGY**.

**SOCIETY**. An assemblage of plants growing in a common habitat under similar life conditions. Some ecologists regard societies and associations as plant communities of equal rank and use the terms as synonyms, but the more recent and better usage seems to be to regard the societies as subdivisions of the associations. See **ECOLOGY**.

**SOCIETY ISLANDS**, or **TAHITI ARCHIPELAGO**. A colonial possession of France in the south Pacific, consisting of an archipelago of 11 islands, extending from 16° to 18° south lat., and from 148° to 153° west long. (Map: The World, Western Hemisphere, L 6). It is divided into the Leeward and Windward groups, the former including the islands of Raiatea, Huahine, Tahaa, Borabora, Maupiti, Tubuai, and a few smaller islets, and the latter group comprising Tahiti (q.v.), Moorea, and a few others. Total area, estimated at 637 square miles, of which Tahiti covers about 600. The population is estimated at about 15,000. The islands are volcanic, mountainous, and surrounded with coral reefs which form coast lagoons. The highest peak, on the island of Tahiti, has an elevation of over 7000 feet. The climate is hot and moist, but not unhealthful. The flora is luxuriant and especially rich in trees. Bananas grow in abundance and a very nutritious species (*fei*) is abundant in altitudes of from 3000 to 5000 feet. The fauna is rather poor. The chief agricultural products are coconuts, bananas, sugar, and vanilla. Only a small part of the agricultural land is tilled, and the colony is in a general state of backwardness. The exports are mainly copra, mother-of-pearl, vanilla, and fruits. Administratively, the group forms the chief of the French establishments in Oceania.

The discovery of the Society Islands dates probably from 1606, when they were visited by the Spaniard Pedro Fernández de Quiros. Although several explorers visited the group before Captain Cook, it is chiefly the latter who gave to the world the first detailed description of the islands. At the time of Cook's visits (1769, 1773, 1774, and 1777) the islands were under the rule of minor chiefs exercising both civil

and religious authority in the several islands or in the several districts of Tahiti. Partly as an outcome of the visits of Cook and other explorers to Papeete, which placed firearms and metal implements in the hands of the chief of that district, that petty ruler acquired the sovereignty over the whole archipelago and laid the foundation of the royal house of Pomare. The islanders worshiped the four great gods of the Polynesian cultus with human sacrifices on temple pyramids (*marae*) and were particularly observant of the tabu; in the early years of the last century they were converted to Protestant Christianity by the London Missionary Society, the first effort of the beginning of foreign missionary attempt at evangelization. The natives are of a stately and fine Polynesian type. They are kind and very mild, and were readily inclined to adopt Western civilization. The discoverers found that they built comfortable dwellings. In 1788 the island of Tahiti was visited by the *Bounty*, and soon after became the place of refuge for the mutineers of that vessel, some of whom were subsequently taken to Great Britain by the *Pandora*. The rivalry between the French and English missionaries led to the interference of France in 1838 and to the subsequent official annexation of the group in 1880. Consult: Meinecke, *Die Inseln des Stillen Oceans* (Leipzig, 1875-76); Brassey, *Tahiti* (London, 1892); Büssler, *Neue Südseebilder* (Berlin, 1900).

**SOCIETY OF AMERICAN ARTISTS, THE.** An organization of painters and sculptors, founded in New York City in 1877 and consolidated in 1906 with the National Academy of Design. During the nearly 30 years of its existence the Society served a useful purpose along the lines intended by the founders. So many of its best men, however, became identified with the National Academy that in 1907 it was deemed wise to unite the organizations. Its principal prizes were taken over and have since been administered by the Academy. See NATIONAL ACADEMY OF DESIGN.

**SOCIETY OF AMERICAN AUTHORS.** A society incorporated in May, 1892, in New York City, for the purpose of assisting authors in their dealings with publishers and generally improving the condition of the craft. It publishes a bulletin, *The American Author*.

**SOCIETY OF FRIENDS, THE RELIGIOUS.** See FRIENDS.

**SOCIETY OF JESUS.** See JESUITS.

**SOCIN, sō'tsin, ALBERT** (1844-99). A German Orientalist, born at Basel and educated there and at Geneva, Göttingen, Leipzig, and Berlin. He traveled much. In 1876 he was appointed professor of Semitic languages and literature at Tübingen, and in 1890 at Leipzig. He published: *Die Gedichte des 'Alkama al-Jahl'* (1867, with translation); *Arabische Sprichwörter und Redensarten* (1878); *Arabische Grammatik* (1885; 5th ed., 1904; Eng. trans.); *Die Inschrift des Königs Mesa von Moab* (1886), with R. Smend; *Zum arabischen Dialekt von Marokko* (1893); *Der arabischen Dialekt der Houvra* (1894), with Stumme; *Diwan aus Zentralarabien* (1901). Socin collaborated also in Kautzsch's translation of the Old Testament (1890), and in Gesenius's *Handwörterbuch über das alte Testament* (Buhl's 12th ed. of 1895).

**SOCINUS.** The Latinized form of the name of two Italian Protestants of the sixteenth century, celebrated as the founders of the liberal

sect called Socinians, and precursors of the modern Unitarians. Both men were born in the Tuscan town of Siena, the elder, LELIO SOZZINI (Laelius Socinus), in 1525, the younger, FAUSTO (Faustus), nephew of the preceding, in 1539. Lelio applied himself to the study of Greek, Hebrew, and Arabic, that he might better understand the Scriptures. There is a disputed tradition that he was a member of an heretical society at Vicenza, at the age of 21, and that he fled to escape persecution. It is certain that the society was compelled to disband. Socinus visited France, England, and Holland, and met many Protestant leaders, including Calvin. He finally settled in Zurich, where he died in 1562. Though claiming the right of free theological inquiry, he never professed anti-trinitarian views.—FAUSTUS SOCINUS, after an unsystematic education, went in manhood to Basel for religious study, thence to Transylvania, where anti-trinitarians were numerous, especially among the nobility, and finally (1579) to Poland, ultimately the centre of his influence. As a theological disputant, writer, and preacher, Faustus exhibited zeal and ability, but he encountered opposition from Roman Catholics and Protestants alike, through his attacks upon fundamental Christian doctrines. His position was that, although the Bible was authoritative and the gospel history miraculous, no doctrine contrary to reason or to moral progress should be retained. This led him to modify the current teaching respecting the nature of man, sin, and the deity of Christ. He held that certain parts of Christian faith were above reason and yet were to be accepted, and that Christ possessed a superhuman nature and character, but that the extrascriptural terms used of him in theology, like "person" and "substance" are unwarranted. After disputation with several Protestant leaders, Socinus was charged with sedition and forced for a time to withdraw from Cracow. His views finally aroused such antagonism that popular outbreaks occurred, in which Socinus was shamefully handled. His last days were spent in retirement in the village of Luclawice, where he died in 1604. His influence was very strong in shaping the theology of the Unitarian church in Poland.

**Bibliography.** Among the most important writings of Faustus Socinus are his *De Jesu Christo Servatore* and *De Statu Primi Hominis ante Lapsum*. In the former he discusses the person and work of Christ; in the latter, the doctrines of sin and grace. The *Racorian Catechism* (1605), a formal and elaborate statement of Socinian theology, was based largely upon outlines which he had made. The *Works* of Socinus are printed in the *Bibliotheca Fratrum Polonorum*, vols. i, ii (Amsterdam, 1656). Consult also: Rees, *The Racovian Catechism* (London, 1818); O. Foek, *Der Socinianismus nach seiner Stellung in der Gesamtentwicklung des christlichen Geistes* (Kiel, 1847); Bonet-Maury, *Des origines du christianisme unitaire* (Paris, 1882); H. M. Beard, *The Reformation of the Sixteenth Century in its Relation to Modern Thought* (London, 1883); J. H. Allen, *History of the Unitarians* (New York, 1894); Adolf Harnack, *History of Dogma*, vol. vii (Eng. trans., Boston, 1899); Albrecht Ritschl, *Christian Doctrine of Justification and Reconciliation* (Eng. trans., Edinburgh, 1902); A. **SOCIOLOGY** (from Lat. *socius*, companion, associate + Gk. *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The science of society, comprehending the analysis and classification of social facts, the scientific description and history of society, and the explanation of society in terms of simpler phenomena. Sociology is conveniently divided into general and special sociology. General sociology is the study of the universal and fundamental phenomena of society. It investigates the facts and correlations found in all societies, the types of society, and the stages of social development. It seeks to discover the general laws and the causes of social evolution. Special sociology consists of the entire group of social sciences, including culture, history, economics, jurisprudence, and politics, each of which deals minutely with some one phase of social organization, social activity, or social development. Sociology includes social statistics, and so much of history as may truthfully be said to repeat itself, i.e., those constant facts of coöperation, institutional life, and social welfare which recur in all communities and in all ages. The methods of sociology are inductive. Its chief dependence is upon comparative historical studies and upon statistics. It draws largely upon psychology also for data and for principles of explanation.

#### HISTORY

The philosophy of social relations is one of the most ancient parts of human wisdom. The sacred books and the laws of Egypt and of Babylonia, of Palestine, and of Greece abound in empirical maxims of domestic and public economy, social justice, and statecraft. In the *Republic* and the *Laws* of Plato, and especially in the *Politics* of Aristotle, we have the beginnings of a scientific classification of social facts, and a number of important generalizations. In the writings of Aquinas and Dante, of Machiavelli and Vico, of Bodin, Althusius, Spinoza, Hobbes, Locke, Hume, and Rousseau, we have acute interpretations of social phenomena in terms of human nature, i.e., of motives. Montesquieu (q.v.), in *L'Esprit des Lois*, laid the foundations of an interpretation in terms of external conditions or environment, and this interpretation was further developed in a few special directions by the Physiocrats. In none of these writings, however, were scientific methods of investigation strictly followed, and in none of them after Aristotle did there appear the conception of a comprehensive social science. They were penetrating studies of special phases of social phenomena, not explanations of society as a whole.

The conception of a comprehensive social science we owe to Auguste Comte, who invented for it the objectionable name "sociology." Comte regarded society as a perfect unity and protested against the attempt to investigate religious, economic, or political phenomena apart from one another, as necessarily misleading. His chief interest, however, was to include the study of society within a scheme of positive philosophy, from which all theological conceptions and speculative methods should be eliminated.

The concept of a general sociology left little impression upon scientific thought until Herbert Spencer wrote *The Study of Sociology* (1873), and made the "principles of sociology" an integral part of his system of "synthetic philos-

ophy." Spencer's system is an explanation of society in terms of evolution. He regards society as an organism, which undergoes integration and differentiation. This social organism conditions the life of the individual. In the struggle for existence social groups, like individuals, come into conflict. Fear, born of conflict, for countless ages is a controlling emotion. Dominated by fear and its sister passion vengeance, men precipitate conflicts which are not forced upon them by necessity, and which often assume the proportions of war. Character is molded to militarism. Cruelty and treachery towards enemies is a virtue. Submissive obedience to authority is exacted, and the whole social organization is pervaded by coercion. From the fear of the living have arisen a ceremonial and a political control, and from the fear of the dead, growing out of the belief that the spirit, surviving the body as a ghost, continues to interfere in the affairs of the living, has arisen a religious control. The ceremonial, political, and religious systems are the regulative mechanism of society. Captives taken in war, or whole populations reduced to serfdom, constitute the sustaining system. Militarism consolidating small groups into petty states, and these into nations, achieves social integration; but by widening the area within which peace prevails it brings about its own decline. The transition from militarism to industrialism, thus made possible by social integration, transforms human nature and social institutions. Spencer's system is a coherent scientific whole, yet it lacks one important feature of a growing science. It does not develop and apply any distinctive method of investigation.

Such a method had already been contributed by Quetelet, the Belgian statistician, who in his valuable works set forth the one method of research by which the study of social phenomena will in time be brought to that exactness which characterizes older sciences.

Thus far, however, systematic treatises on sociology have been devoted almost wholly to the further exploitation of general concepts, and little progress has been made toward correlating these with statistical method. Sociological systems may be classified as physiographic, biological, psychological, and ethnographic. The physiographic systems attempt to explain all social evolution in terms of the action of environment upon character, conduct, and institutions. Many of the so-called economic interpretations of history also belong in this group, while others fall into a different class. In strictness we ought to distinguish between an organic economy, meaning thereby the whole scheme of adjustment between organism and environment, and an industrial or business economy, a comparatively late development of human evolution. Social evolution is an incident of organic economy; industrial economy is an incident of social evolution.

What may be called the biological-organic conception of society presupposes more or less of the physiographic, but it does not accept the usual account of the influence of environment upon the community as adequate. Granting that social processes are in the last analysis to be accounted for by the relations of organism to environment, including competing organisms, the biologists raise the question of the nature of society itself, and answer that society is a com-

pound organism, having its own anatomy and physiology, its pathology also, and assume that these are the true subject matter of social science.

In like manner the psychological conception of society presupposes the physiographic explanations, and it does not deny that in a general sense society may be regarded as organic. But it prefers Spencer's word, superorganic, because it insists that social relations are essentially facts of mind. Consequently it denies that society is explained until we know how the mental operations of individuals are combined in the common sentiments and opinions and expressed in the collective will of the community.

To the ethnographic systems of sociology belong those interpretations which emphasize the ceaseless struggles among tribes, nations, and races, and find ultimate explanations of social integration and differentiation in conquests and absorptions of the weak by the strong.

An obvious criticism upon these systems is that they take society already existent for granted. They do not account for the origins of society as such. The immediate antecedents of all social relations are facts of the psychological order. But these facts, of course, are themselves conditioned by biological and physiographic relations. It appears, therefore, that sociological theories should start from psychological premises, but that the correlation of all processes with the character of the physical environment should be recognized throughout. This is attempted by Franklin H. Giddings. (See *Bibliography*.) He derives all social phenomena from the like responses of a plural number of individuals to the same or like stimuli. Habitual like response constitutes mental and moral resemblance. Those who are mentally and morally alike become aware of their similarity. Awareness of resemblance beginning in mere feeling or sympathy, but becoming perceptive and rational, is called the consciousness of kind. Those who share the consciousness of kind develop their like responses to stimuli into a concerted volition which becomes a practical coöperation for useful ends, and systematic coöperation develops into the more or less enduring forms of social organization. This chain of processes has antecedents in the density and composition of the population, which, in turn, are determined by the character of the physical environment. Certain regions maintain homogeneous populations only. Others attract heterogeneous populations, the composition of which determines the possibilities of common response to stimuli.

#### SYSTEMATIC SOCIOLOGY

Systematic sociology is naturally divided into four parts, viz.: (1) The critical examination of data, methods, and problems, including the delimitation of sociology from other sciences; (2) descriptive sociology, an analysis and classification of contemporaneous social facts, with generalizations concerning social processes; (3) historical sociology, a study of the evolution of society from animal groupings and the communities of primitive men down to the civilized nations of modern times; (4) theoretical or explanatory sociology, an attempt to derive from the description and history of society and from the general principles of evolution a theory of social causation.

**Critical Examination.** Some of the chief

topics falling within the first of these divisions of systematic sociology have been touched on in the foregoing account of the history of the science.

**Descriptive Sociology.** A few words of analysis of the subject matter, viz., social phenomena, may fitly introduce an account of the second division, descriptive sociology. A fact of the physiographic order is the starting point. Throughout the universe as known to man, objects of like kind are commonly grouped or segregated in space, and not scattered in a disorderly distribution. This is more particularly true of living organisms, all species of which have their respective geographic areas, and within these their favorite habitats or haunts. Plants of any given variety are usually found massed in particular places. Animal organisms are commonly found in swarms, bands, or flocks. Human beings live in hordes, tribes, and nations.

From this purely physical fact we pass in the analysis of society to facts correlated with mental activity, and then to facts psychological. Of all the resemblances which may be observed in the units or individuals constituting a normal aggregation of living creatures, the two of chief importance are (1) morphological and physiological similarities produced by common descent and interbreeding, and therefore correlated with degrees of kinship; (2) similarities of nervous organization and mental activity which may or may not be closely associated with degrees of kinship. On the functional side the most general phase of like nervous organization is a like responsiveness to the same stimulus or to like stimuli. Under the same or like circumstances two or more animals or human beings of like nervous organization behave in like ways.

Human beings who intellectually as well as sympathetically apprehend their common nature find pleasure in communication and acquaintance. They discover that, responding to the same impulses, they form common purposes and can work together for common ends. Systematic coöperation thus arising holds men together in those relatively permanent relationships which constitute social organization. Social organization reacts upon the welfare of the community, furthering survival and individual happiness.

A complete description of society should comprise the following parts: (1) An account of the social population regarded as a physiographic phenomenon, an aggregation of organic units determined by the situation and resources of its habitat. (2) An account of the mental qualities and the conduct of the social population; its subjective resemblances and differences; its types of intellect and character; its antipathies and sympathies; its purposes, its choices, its collective will. These phenomena together are the social mind. (3) An account of the social organization which the social mind creates, and through which its purposes are achieved. (4) An account of the social welfare resulting from the policies which the social mind has approved, and from the normal functioning of the social organization.

1. *The Social Population.*—An account of the social population must always be prefaced by a physical description of the territory occupied, although, strictly speaking, this is no part of sociology proper. This necessity has been recognized by the United States Census Bureau.

Since the census of 1890 an account of the dominant geographical features of the national domain has been included in the reports, and the distribution of population with reference to these features and to altitude, drainage basins, rainfall, and temperature, has been shown. Still more important would it be to show the distribution of population with reference to natural resources, viz., agricultural fertility, mineral wealth, commercial and industrial opportunities.

Density of population is determined by the combination of two factors, viz., the birth rate and the migration rate. No community of large dimensions is a purely genetic aggregation, maintained wholly by its birth rate. It is at the same time a congregation, a group brought together in part by the incoming of individuals or families born in other parts. Genetic aggregation itself is more or less complicated by variation, and this, in combination with the results of migration, gives rise to a composition of the population of elements more or less unlike. The physical differences thus comprised include organic variation, differences of age, the difference of sex, and the degrees of kinship. The degrees of kinship include consanguinity, or the nearest degree of blood relationship; propinquity, the somewhat remoter degree of neighboring communities that have much intermarried; nationality, the kinship of those who from their birth have been of the same speech and political association; potential nationality, or nationality in the making; ethnic race, glottic race, chromatic race, and cephalic race.

These compound race terms are used to avoid confusion. Ethnic race includes those nearly related nationalities which speak closely related languages and exhibit common psychological characteristics. For example, the Teutonic race includes the Saxon-English, the Dutch, the Germans, and the Scandinavians, all related nationalities. The glottic race is a yet broader kinship which includes those related ethnic races which at some remote period had a common culture and spoke the same language, as, e.g., the Aryan glottic race, which includes the Teutons, the Celts, the Latins, and the Slavs. Chromatic race is that remote degree of relationship which includes all glottic races of the same general color of the skin and type of hair. Cephalic race is that most remote degree of kinship which is manifested in peculiarities of cranial structure. There are various gradations from the dolichocephalic, or long head of the negro, to the brachycephalic, or broad head of the Mongol.

The influence of the physical environment is seen in the degrees to which a population is heterogeneous, no less than in the degree of density. Naturally isolated regions, and regions that offer no great temptation to immigration, remain relatively homogeneous. Agricultural regions remain more homogeneous in population than mining regions or points of commercial or industrial opportunity. Regions of great agricultural fertility which share also in other advantages have usually in the world's history become heterogeneous in population through armed invasion and conquest. Sooner or later, whatever the admixture of nationalities and races, a large degree of amalgamation takes place in every population through intermarriage. While external influences may be tending to make a social population composite, its

own internal forces work towards homogeneity and unity.

2. *The Social Mind*.—The evolution of the social mind is determined by those physical facts of the density and composition of a social population which condition its subjective life. The more homogeneous a population is the more certainly will its individuals be moved by common impulses. Heterogeneous populations have varied interests, which is another way of saying that they respond to differing stimuli.

The like responses from which social activities are developed are temporary or habitual, and the stimuli of temporary like responses include nearly all of the initial causes of association. Where the stimuli are persistent and lead to habitual conduct the whole nervous organization is molded accordingly. Mental and practical resemblances are created. The stimuli presented by external nature create types of emotion and of intellect. The stimuli of economic opportunity, leading to activities of utilization, create types of disposition. The stimuli which impel men to adapt themselves to their environment, when they have failed to adapt the environment to themselves, create types of character. Types of emotion, intellect, disposition, and character in their various combinations make up the various types of mind.

The various mental and moral types found in any large population of civilized men have been produced by varying degrees of responsiveness to differing stimuli, and in their turn they determine the degree to which the whole population, or large sections of it, can share a common impulse. The more highly differentiated a population is into intellectual and character types the fewer are the stimuli which can move all to common purpose and action.

The causes of assimilation are conflict, toleration, and imitation. Gabriel Tarde has undertaken to derive the entire social process from imitation. He recognizes in society, and in the universe at large, conflicts of action, as well as repetitions or similarities, and in his important work, *La logique sociale*, he develops the social aspect of a process of adaptation, whereby conflicts of action and repetitions of action are reconciled. This is to identify all similarities or repetitions of action with imitation. It would seem to be more accurate to recognize both original (or simultaneous) similarities and repetitions (or sequent) similarities, and to identify imitation with the latter only. Moreover, inasmuch as it is through the establishment of sequences of similarity that adaptation or adjustment is brought about, imitation must necessarily be identified with adaptation. All of these processes are seen in perfection in a society of mixed elements. Conflicts sometimes result in the subjection of the weaker, sometimes in an equilibrium of strength, which is the basis of toleration, and sometimes in good feeling and imitation.

Given, now, similarities of mind and character in a population, and a consciousness of kind, conditions are present for the formation of agreeing purposes, a concert of wills, and co-operation. Together these processes may be called concerted volition. The degree of resemblance, the consciousness of kind, the character of the stimuli, determine the extent of concerted action. This may be a temporary concerted volition, such as is seen in festivals, crusades, strikes, panics, insurrections, and political cam-

paigns, or it may be a relatively enduring co-operation. Coöperation grows by indistinguishable gradations out of momentary like responses which may begin accidentally, as, e.g., when bystanders run simultaneously to a person hurt or in trouble. The consciousness of kind is necessary to supplement such beginnings by making it evident to each of the participating individuals that they are working towards the same end, and that they are sufficiently alike to work together successfully. There must, however, be yet another factor. The purpose achieved by the combined action must be of mutual benefit, and the utility must be perceived.

Coöperation is public or private. It is public when all individual members of an entire natural society act together with one purpose and authority, either because all have the same desire, or because one or a few take the lead and others acquiesce or obey. An entire natural society viewed as coöperating is a state. When only a part of the social population responds to the same stimulus, and engages in coöperation without the participation or command of the state, although not without its tacit or implied consent, the coöperation is private or voluntary. Coöperative activities, whether public or private, are of four kinds, viz., cultural, economic, moral or legal, and political. The order in which these activities have been named is the order of their genesis and evolution. Seemingly, but not in reality, this order denies the primitive, fundamental character of economic relations. Betrayed by a misconception of cultural activities, many sociologists have placed them wrongly in the series. Their true nature and history can be understood only when we remember the distinction already mentioned between organic and industrial economy. The organic economy of the world of vegetation shades into the instinctive economy of animals, and that in turn into the rational economy of mankind. For ages before it becomes an industrial or business economy, the practical life of man in his struggle with the forces of nature is a ceremonial economy, consisting chiefly of magic, incantations, and formal rites. Language and manners begin among the lower animals as products of their efforts to appropriate the bounty of nature and of their struggles with hostile natural forces and with one another. Animistic ideas, the plastic and poetic arts, religious ideas and practices, originate in primitive human society, in attempts to understand and to master or propitiate the powers upon which man's life and comfort depend. They are all a part of the primitive economy.

It is out of these primitive economic activities that systematic industrial and commercial activities constituting the modern business economy are developed.

Coöperation in the development of moral thought and activity, including juristic activity, which is the public development of moral activity, has antecedents in both cultural and economic interests, but it also has characteristic stimuli of its own, chiefly injuries and wrongs.

Political coöperation on its public side is the governmental activity of the state. Private political coöperation includes all such lawful activities as the functions of political parties, and the conduct of campaigns, and such unlawful activities as insurrections and revolutions. Among the stimuli of political coöperation are superior power, to which enforced obedience is

yielded, the impressive power of a strong personality manifested in leadership, and danger from foes. These are familiar causes that come readily to mind, but others less obvious are as important. Among them are those definite aims which political action seeks to achieve. They include the preservation of the group, its safeguarding, the maintenance of a certain character or kind in the population (an aim revealed, e.g., in the immigration laws), and certain ideals of the preferred distinction or attainment of the community, as, e.g., power, or prosperity and splendor, or justice, or liberty and enlightenment. Approximate political ends, or means to the attainment of the remoter ends just named, also are stimuli of collective action. Among them are the permanent possessions of the community, especially its territory, and policies in respect of population, or in respect of the habits, customs, and activities of the people.

Political coöperation itself, as distinguished from its stimuli or causes, is always a policy of some kind. Policies involve social choices, and these involve social valuations. The various ends which political action seeks to achieve are more or less useful to the community and such utilities are variously valued. Highest in value are ranked those objects for which the society exists, viz., the concrete living individuals who compose the community, the social type or ideal, and the attainment of the community. Lower in the scale of values are placed all those political relations and possessions which are but means to the attainment of social ends.

When the like responses of many individuals have developed through the consciousness of kind into concerted volition, the total resemblance thus established may be called like-mindedness. According as instinctive, sympathetic, dogmatic, or critical elements predominate does concerted volition vary in character from an almost instinctive action up through impulsive and contagious action to formal or fanatical action and ultimately to deliberative action. Like-mindedness, as a whole, may therefore be described as instinctive, sympathetic, dogmatic, or deliberative. Instinctive like-mindedness is found only in those ignorant populations in which the ideomotor type of mind predominates. Sympathetic like-mindedness, widely prevalent in all nations, is characterized by impulsiveness, suggestibility, susceptibility to the stimuli of emblem and shibboleth, imitativeness, and contagious emotion. Association in crowds is highly favorable to its genesis. Among the chief forms that sympathetic like-mindedness assumes are revivals, panics, riots, and insurrections. Dogmatic like-mindedness is marked by dogmatically held belief, deference to authority, and fanatical action. It finds expression in zealous agitations, strong partisanship, and reliance on governmental power to regulate private conduct. Deliberative like-mindedness is characterized by inductive research, discussion, freedom of speech and of meeting, and rational action. It substitutes evidence for irrational modes of proof, and it is creative of the highest institutional activities.

The chief social bonds vary according to the situation, size, and composition of the population, its degree of mental and moral homogeneity, and the dominant stimuli of its activities. In small and comparatively isolated populations, ethnically and mentally homogeneous, there is a strong consciousness of kind, and the

community is held together largely by acts of imitation and kindness. In the small and heterogeneous community, as a mining camp, e.g., where men, strangers to one another at first, congregate in the pursuit of economic well-being, the sympathetic elements of the consciousness of kind, and imitation, are relatively unimportant factors. Conflict, sharp and decisive, between man and man brings about a general condition of toleration and spontaneous justice, gradually supplemented by good will and helpfulness. In such a community there is always spontaneous allegiance to daring leadership and it becomes a social bond of great strength. Contagious emotion also is often a bond supplementing the others.

In a compound population, so made by invasion and conquest, the bond that ties the social system is the power of the conquerors and the submission and obedience of the conquered. The permanence of this bond depends upon that physiographic concentration and practical cohesion of the conquerors which insures the maintenance of their sovereignty. If the character of the country and the stimuli of economic opportunity and of opportunity for adventure are such that the invaders become dispersed, various personal efforts to establish sovereignty result in the creation of those untrustworthy bonds of intrigue and conspiracy which are made to appear of universal importance in the chapters of Machiavelli's *Prince*, and generally in the records of turbulent times. With the establishment of equilibrium through conflict, which eliminates excessively unlike and unequal elements from the population, conspiracy gives place to relations of contract, which thenceforward remains an important, or even the chief, social bond. Finally, in a complex population of highly differentiated elements which are undergoing assimilation, and which are already mentally alike in the important respect that they cherish common ideals, especially ideals of liberty and enlightenment, the chief social bonds may come to consist in fidelity, honesty, and social service.

Thus it appears from descriptive sociology that many of the theories of the origin and nature of society which appeared in political philosophy from the days of Aquinas and Dante down to those of Rousseau were within limits true. The sympathy or fellowship theories of the early Christian writers are true of small homogeneous communities. The natural-justice theories of the early legal writers are true of small heterogeneous communities. The sovereignty theories which found full expression in the writings of Bodin are true of the compound communities formed by invasion and conquest. The intrigue and conspiracy theories of Machiavelli are true of compound populations which have been reduced to disorder by the disintegrating influence of chronic conflict. Society in this condition is the "state of nature" of Hobbes, while the state of nature of Locke and Hooker exists when the elements of the population are sufficiently alike to live in toleration, if not in sympathy. Given conditions of toleration and natural justice, the creation of a higher social order through good understanding and contract may always be looked for.

3. *The Social Organization.*—The social organization is the outcome of two conditions, viz., (1) permanent relations of domicile and coöperation, and (2) the approval and sanction

of such relations by the general will. Social organization is therefore an expression of like-mindedness in the population. Peculiarities in its development are partly accounted for by the passion of like-minded people to make the community more and more homogeneous in mental and moral qualities, and partly by a growing appreciation of the value of unlike-mindedness as a means of variation and progress.

The forms of organization are (1) the private and the public, (2) the authorized and the unauthorized, (3) the unincorporated and the incorporated, (4) the component, and (5) the constituent. Authorized forms are institutions, and an institution may be defined as a social relation that is consciously permitted or established by adequate and rightful authority, i.e., in the last resort, by sovereignty. The social composition is that grouping of individuals by dwelling place which makes up the series of component societies named below. A chief characteristic of the social composition is the commingling in each group of both sexes and all ages, and the consequent ability of each component society to perpetuate itself and live an independent life if it were cut off from all the rest of the world.

Component societies are of two great types, the ethnic or tribal, and the civil or demotic. Ethnic societies are almost purely genetic aggregations. A real or fictitious blood relationship is their chief social bond. Civil societies are partly genetic, but also largely congregate associations. Each consists of individuals bound together by habitual intercourse, mutual interests, and coöperation, emphasizing their mental and practical resemblance, and giving little heed to their blood relationships. Ethnic societies may be metronymic or patronymic. A metronymic group is one in which all relationships are traced through mothers. A patronymic group is one in which all relationships are traced in the male line through the fathers. The series of component groups in ethnic society is: family, horde, tribe, confederation. The horde is a small aggregation of families, usually a wandering camp, comprising 25 to 100 persons in all. The tribe is a community created by the consolidation of hordes, or by the growth and differentiation of a single horde, occupying a defined territory, speaking one language or dialect, and conscious of its unity. The confederation is a number or tribes united for war or other purposes, but maintaining a social organization on the basis of kinship, and therefore not developed into a true civil state. In civil society the composition series is: families, hamlets, villages or parishes, towns, communes or cities, counties or departments, kingdoms, republics or other commonwealths, federal states or empires.

The combination of small into large groups is made possible by the broadening consciousness of kind and the passion to perfect a mental and moral homogeneity throughout a widening area. This passion has both a sentimental and a practical aspect, the latter being found in a relatively greater security and the diminution of conflict through the extension of mental agreement.

The social constitution embraces all those specialized and correlated associations which carry on diversified social activities. Each has a defined object in view, and its members are selected with reference to their interest in its

purpose and their ability to contribute to its realization. The social constitution is made possible by the differentiation of ideas and habits.

Constituent societies, like component, are ethnic or civil. In tribal communities the constituent society is usually not entirely differentiated from the component. The family, or the tribe, or a segment of one or the other, does duty in discharging some special function which, in civil society, might be performed by an association quite separate from the component group and specially organized for the purpose. The most interesting partially differentiated organization in tribal society is the clan. The clan is constituted of those persons who are descended from a common ancestor or ancestral group in a single line, through the mother or through the father. It is therefore only half of a natural group of consanguinini. Its functions are cultural, economic, and juridical. It preserves traditions, it owns common property, and enforces rights and obligations among its members, especially in matters of marriage and vengeance. The clan is known by various names in ethnology and in history, more familiarly by its Roman name *gens* (q.v.).

Often in tribal society is found a brotherhood of related clans which is called, from its Greek form, the *phratry*. The tribe, primarily a component group, is a military organization, and the confederation is a political organization.

Besides these component-constituent groups there are in tribal society certain special associations, almost always secret in their organization and functions. The most important are religious secret societies.

In civil society the household, the incorporated village, the municipality, the county, and the state are all component-constituent groups. They are purposive associations with definite functions, each approximately but not completely identical with a compound group. The state, e.g., the supreme political organization, is never precisely identical with the commonwealth or the nation regarded as a component society, since the latter always includes inhabitants who are neither voters nor even citizens in the state. As in ethnic, so in civil society, the associations which are completely differentiated from the social composition are voluntary organizations. They include cultural associations, the most important of which is the Church; economic associations, the most important of which are business corporations; moral and juristic associations, the most important of which are philanthropic organizations; the political associations, the most important of which are the great political parties.

The stability of organization depends upon a recognition by the community that organization must benefit the organized, and that in a highly specialized social constitution expert knowledge is of vital importance.

4. *The Social Welfare.*—In studying the social welfare we investigate the social functioning. The sum of the ends for which society exists is social welfare. Such ends are approximate or ultimate. The immediate results of efficient social organization are certain general conditions of well-being, in which all members of the community may share. They include the security of life and property which the political system maintains; the liberty and the justice which it is the business of the legal system to

maintain; the material well-being which is created by the economic system; and the knowledge and the command over nature which are created by the cultural system. Collectively these proximate ends are public utilities. The ultimate end of society, as Plato and Aristotle so clearly recognized, is the perfection of personality, the creation of the social man. In the evolution of the social personality all phases of the life of the individual are affected. Vitality, mentality, morality, and that special aspect of morality which may be called sociality, are broadened and strengthened, or they are diminished, by the relations which man bears to his fellows. No two individuals are affected by social conditions in quite the same way or degree, and therefore the population is differentiated, in respect of these matters, into classes.

The primary distribution of the population according to vitality is into physically normal persons and defectives, and the normal are conveniently graded into the high, the medium, and the low vitality classes. In the high vitality class are those individuals who have a high birth rate, a low death rate, and a high degree of bodily vigor and mental power. This class is found chiefly in the well-to-do agricultural sections of the population. The medium vitality class roughly corresponds to the business and professional men of the large towns and great cities. The low vitality class is created chiefly by unsanitary conditions in great cities, but it is found also in an ignorant, uncleanly part of the rural population. The defective include the blind, the deaf and dumb, and the congenitally deformed.

The supreme achievement of society and the final measure of the success or failure of any state is its contribution of great personalities, great creations of art, great thoughts and ideals, to that universal society which embraces all mankind and endures through the ages of history. Measured by this standard some petty city states, like Athens and Florence, have been among the supreme examples of social evolution.

**Historical Sociology.** In historical sociology we again study the phenomena of the social population, the social mind, the social organization, and the social welfare, but on a larger scale. We inquire into the evolutionary origins of society and we find that long before man appeared upon the earth social relations had become established in the animal world, and that man undoubtedly began his career with an endowment of social instinct. Social relations and mutual aid influenced natural selection, and thereby affected the whole course of animal evolution. Association in its beginnings, therefore, was zoögenic. Through a further development of association, language, animistic ideas, arts, and religions came into existence, and the animal mind was converted into the human mind, and the animal body into the human body. This stage of evolution was anthropogenic. A higher evolution of the consciousness of kind created tribal instincts and customs, and gradually built up the highly complex system of ethnic society. This was ethnogenic association. Finally, through the recognition of mental and practical resemblance irrespective of kinship, civil or demotic society came into existence. The *demos* or people, as distinguished from the tribe, appeared, and with it civilization.

In animal societies all the essential phenomena of a social population may be observed, but those of the social mind are of the most rudimentary sort. There is no social organization beyond the slight beginnings of family life and a loose formation of bands or flocks.

In anthropogenic association the phenomena of the social mind begin to assume importance. Language is a product of association and reacts upon it. Vocal signs become conventionalized through imperfect imitation. The power of conceptual thinking, correlated with the evolution of language, is correlated also with association, for every true concept is a product of more than one mind. Conceptual thinking and self-consciousness enormously multiply the possible responses to stimuli and bring into the consciousness of kind all its higher reflective elements.

The great problems of ethnogenic association are those of the genesis of family, clan, tribe, and confederation; of the priority of relationship through mothers over relationship through fathers; and of that gradual disintegration of organization based on kinship, by the growth of an essentially feudal association based on personal allegiance, which prepared the way for civilization.

The primitive family, we may now feel reasonably sure, was an unstable pairing arrangement, usually of short duration. From this form were differentiated polyandry (q.v.), polygamy (q.v.), and monogamy. (See FAMILY; MARRIAGE.) The steps by which the clan was formed perhaps cannot be quite clearly traced. Primitive man counts relationships in one line of descent only. This fact accounts for the exclusion from the kindred of one-half of all those persons who are equally near in blood. The development of the tribe and the confederating of tribes is a consequence chiefly of warfare, which often brings weak groups under the domination or protection of the strong, or leads related tribes to combine against their common foe. When new tribes are formed by the subdivision of one that has grown too large for subsistence on the tribal domain, families from each clan of the older tribe may go into the new tribe. In this way a cluster of tribes may be closely related in blood and speak dialects of a common language, conditions highly favorable to confederation and subsequent evolution as a nation.

Tribal confederations that have become civil states have undergone a further evolution, however, which has destroyed many of the characteristic features of tribal organization. To begin with, the metronymic system is superseded by the patronymic. The transmission of property and office from father to son thus made possible leads to the differentiation of certain families as of superior rank. If a primitive agriculture has been supplemented by pastoral industry, wealth in cattle becomes one of the chief temptations to engage in tribal wars. Chieftains as leaders of successful expeditions receive an exceptionally large number of stolen cattle and the privilege of pasturage on the border lands of tribal territory. They obtain also as retainers and herdsmen the broken and ruined men of other tribes, whose clans have been destroyed and whose future position in society is secured only by their allegiance to a powerful protector. From such beginnings a rude tribal feudalism develops, which encroaches steadily upon the earlier kinship system. Evidences of this stage of evolution are found in

various bodies of barbarian law, but especially in the Irish and Welsh codes.

When a confederation of tribes becomes thoroughly consolidated by war or otherwise, the chieftaincy of the confederation, having become hereditary, may develop into a kingship through the uniting into one of the offices of chief military leader, supreme judge, and high priest.

At this stage the ethnic society is on the point of passing over into civilization. If it is tempted by the pressure of population upon the means of subsistence to migrate to a more productive region, and, after conquering the occupiers of a coveted territory, reduces them to task work and establishes itself permanently on the soil, it undergoes a further development of feudal organization, and in the course of time begins to include as members of the settled clans and tribes any newcomers who come to reside among them.

Civilization once established develops through three stages, which are well marked so far as the structure, policy, and activities of society are concerned, but which to some extent overlap and run into one another chronologically. The breakdown of the kinship system, and the intermingling of men of diverse origin at centres of industrial and commercial activity, are presently followed by the beginnings of assimilation and amalgamation. When this process is perceived, the possibility of creating a new ethnic unity on a broad scale—the unity of a people, one in language, in religion, and in standards of conduct—is seized upon, and a passion for homogeneity begins to express itself in certain great policies. The attempt is made by military campaigns to bring into one political organization adjacent peoples nearly related in blood, in language, and in tradition, and to annex any territory which may form with that already occupied a geographic unity. The militarism thus developed is of itself a powerful unifying agency, and it is supplemented by policies of religious unification, and by harsh systems of sumptuary legislation and of criminal law.

When the work of nation making by policies of unification has been completed, the first stage of civilization yields to a second, which is a result of the liberation of energies no longer demanded in military activity. Commerce, travel, and learning receive a new impulse. The comparative study of peoples and institutions leads to criticism and discussion. The authoritative régime is subjected to review; it begins to disintegrate under impeachment and resistance. Rationalism and liberalism create the great institutional products of civil liberty and constitutional law. Men no longer care as of old for perfect mental agreement; they encourage the growth of independence and variety. This is the age of progress, of the liberal-legal civilization.

Presently, however, wide liberty, divergence of mental type, and the multiplication of differing interests begin to threaten social cohesion. Powerful and unscrupulous men abuse their liberty, using it to take an unfair advantage of others and to curtail the liberties of the weak. Freedom of enterprise and of contract are followed by an enormous increase of wealth and of population. But the wealth is concentrated in relatively few hands and increasingly large numbers of workingmen find that they are not receiving a proportional share of well-being. Growing inequality places the severest strain

upon the social system, and compels the community to limit liberty in some measure by equality. Political and legal equality come first, but measures of economic equality also are demanded, and great educational enterprises try to achieve an equality of cultural opportunities. This is the modern democratic movement, and the third stage of civilization.

**Explanatory Sociology.** This department is as yet in a very incomplete state of development. So far as the physical side of social evolution is concerned, it exhibits the same phenomena of integration, differentiation, and increasing definiteness of organization that material bodies undergo. The cause also is the same, viz., the equilibration of energy between bodies overcharged and contiguous bodies undercharged. There is such an equilibration between a population and its environment, and all the energy that society is enabled to expend it derives from the bounty of nature, supplemented by industrial activities. There is such an equilibration of energy between strong and weak states and between strong and weak races. The transformation of the weak by the strong can never cease until equilibrium is established. The transformation need not be a military conquest, however, or even an economic exploitation. So far as physical law is concerned, it may equally well be an uplifting of the weak to higher planes of sympathy and intelligence by the hands of the strong. The extent to which the process may thus be philanthropic depends upon the growth of the consciousness of kind. Originally limited to the kindred of horde and clan, it has broadened into tribal and at length into a national consciousness. To-day it is becoming a human consciousness. In all this transformation every change obeys the laws of parsimony. Motion follows the line of least resistance and human activities try to achieve given results with the least expenditure of effort. It is only a corollary of this law that activity is conditioned by the consciousness of kind, since strangeness and antipathy are resisting conditions. It is only another corollary again that dogmatic like-mindedness develops out of sympathetic, and deliberative like-mindedness out of dogmatic; for the results achieved by the lower forms of concerted volition, viz., the instinctive and the sympathetic, are wastefully accomplished as compared with those achieved by the higher forms. These laws are otherwise formulated as the great laws of diminishing and increasing returns, long familiar to economic science, but equally true in the realm of social phenomena. When the lower forms of activity are carried far they begin to yield diminishing returns. When old channels of activity are obstructed energies break through into new channels, and for a time new adjustments yield increasing returns. By these laws we account for the substitution of reason for impulse, of deliberation for moblike action. The substitution is in a broad sense a natural selection. Social activities and forms begin unconsciously. In the course of time men, becoming aware of the social relations that have spontaneously developed, try to perfect them. They create institutions and carry out policies. The unconscious operations of nature now again assert themselves. Some of the products of man's invention, proving useful and promoting his welfare, survive. Others perish and are forgotten. Those social forms survive which, like organisms successful in the

struggle for existence, yield on the whole increasing returns of useful conversions of energy.

**SOCKEYE.** See SALMON.

**SOCORRO.** A town of the Department of Santander, Colombia, formerly its capital, 145 miles northeast of Bogotá (Map: Colombia, C 2). Its chief industries are the weaving of mantles and the manufacture of straw hats. Pop., 1912, 11,427. The town was founded in 1540 and after its destruction in 1681 moved to its present location. In 1781 a formidable revolt took place here, and in 1810 there was issued a formal declaration of independence from Spain.

**SOCOTRA, or SOKOTRA,** só-kō'trà or sōk'-ō-trà. A British protectorate, an island in the Indian Ocean, at the entrance to the Gulf of Aden, about 147 miles east of Cape Guardafui (Map: Africa, K 3). It is 72 miles long and 22 miles broad. Area, 1382 square miles. The centre of the island is occupied by the Haghier chain, attaining nearly 5000 feet. The coasts are partly fringed by cliffs, mostly low. There is a long plain of drifted sand along the south shore. The valleys are well watered and rich in vegetation. The climate is hot and dry. The dry season lasts from May to October, during which time there is practically no rain in the lower parts of the island, and many rivers become dry. The flora is varied, with many aromatic species, as myrrh, frankincense, aloes, etc.

There is little agriculture. The principal commercial products are ghee, aloes, and incense, which are exported to Bombay, Zanzibar, and Arabia. The natives keep extensive herds of goats and cows. The population is estimated at 12,000—a mixed race of Arabs and Hindus who are found along the coasts, and the Sokotri, who are also believed to be of Arabic origin and are confined principally to the mountainous districts. It was occupied by the Portuguese at the beginning of the sixteenth century. Since 1876 Socotra has been under the government of Aden, which pays a small subsidy to the Sultan of Keshin, to whom it belonged. It was formally placed under British protection by agreement with the Sultan in 1886, together with several neighboring islands. Native rule is maintained.

**SOCRATES,** sōk'rà-tēz (Lat., from Gk. Σωκράτης) (469-399 B.C.). An Athenian philosopher. He received as a boy only the old-fashioned elementary education in music and gymnastics, but later familiarized himself with the education of the Sophists in rhetoric and dialectics, with the speculations of the Ionic philosophers, and all the culture of Periclean Athens. Plato represents him as veiling behind an ironical profession of ignorance an ingenuity and resourcefulness that made him more than a match for the most distinguished specialists. Xenophon, while affirming that Socrates held the proper study of mankind to be the moral life of man, adds that he was by no means unversed in the curious inutilities of mathematical and physical speculation. He followed at first the craft of his father, a sculptor, and tradition attributed to him a group of the three Graces draped, which Pausanias saw on the Acropolis. The greater part of his mature life, however, was spent in the market place, streets, and public resorts of Athens in conversation with all who cared to listen, or whom he could lure to render an account of their souls and submit themselves to his peculiar style of interrogation. In Plato and Xenophon he has no other occupation, except, of course, the civic duties of every free-born Athenian. He served as a hoplite with conspicuous bravery at Potidæa (432 B.C.), Delium (424), and Amphipolis (422). In 406 B.C. the chances of the lot made him a member of the senate of the 500 and presiding prytanis on the day when the illegal motion was offered to condemn to death by one vote the generals who had neglected or been unable to rescue the wounded after the naval battle of Arginusæ (q.v.). He refused to consent to the putting of the vote, defying the anger of the mob, even as a few years later he withstood the tyrants and refused to execute the command of the "Thirty" when they bade him assist in the arrest of an innocent citizen, Leon of Salamis. By his wife, Xanthippe, he had three sons. The tradition of Xanthippe as the scolding wife and typical shrew is ignored by Plato, who merely mentions her presence in the prison on the last day before and after the dialogue on immortality.

In the *Apology* or defense which Plato puts into his mouth on his trial, Socrates half seriously affirms that his peculiar way of life was a mission imposed upon him by God. The oracle of Delphi (the story presupposes that he was already well known), in response to the question of an enthusiastic rather than judicious disciple, had pronounced Socrates the wisest of men.

Conscious that his only wisdom was self-knowledge, the knowledge that he knew nothing, he proceeded to test those reputed wise at Athens, the poets, the statesmen, the artists. In each case the value of the specialist's particular talent was more than nullified by his inability to render a rational account of it, and the false conceit of a larger knowledge not possessed, and he inferred that it was his divinely appointed mission to force upon his fellowmen self-knowledge and conviction of ignorance as the first step toward self-betterment. Such a profession exercised for 30 or 40 years amid a gossipy and jealous population brought him more notoriety than popularity.

The effect was heightened by the startling contrast, to Greek feeling, between Socrates's exterior and the dignified and impressive demeanor to be expected of a great teacher and leader of men. The ungainly figure; the protuberant belly; the Silenus-like masque with bald head, prominent eyes, and wide, upturned nostrils; the beggarly garb; the vulgar instances and homely parables in which his wisdom disguised itself; the personal oddities of the man; his hour-long fits of staring abstraction; his ingenious art of cross-examination entrapping the cleverest into self-contradiction; the mysterious admonitions of his "Dæmon" or inner voice; the habitual asceticism of this barefoot philosopher, content with bread and water and one garment summer and winter, yet able on occasion to outdrink and outwatch and outtalk the boldest revelers and most brilliant wits of Athens—all these traits as felt by the inner circle of disciples and portrayed by Plato's art, only add piquancy to the demonic personality thus half revealed and half concealed. But to the multitude they only made up a figure of comedy. In the *Clouds* of Aristophanes (423), the man whom we conceive as the antithesis of the Sophistic rhetoric and the founder of moral and mental as opposed to physical philosophy appears as the master of a "thinking shop" in which pale-faced disciples burrow into the bowels of earth, and where unscrupulous fathers can have their sons taught the art of making the worse appear the better reason, while Socrates himself aloft in an aerial basket "treads the air and contemplates the sun." The comedian is not bound to make nice distinctions. For Aristophanes, Socrates was an apt comic embodiment of the new learning which the conservative poet detested. Like the Sophists, he occupied the young men with something else than the care of healthy bodies, and he resembled the Sophists in the unsettling effect of his questioning of the established order. Plato, for artistic reasons, puts these attacks of comedy as manifestations of the popular prejudice in the forefront of the *Apology*. The immediate causes of Socrates' condemnation were probably the hostility aroused by his ironical comments on the democratic method of deciding great questions by the lot or the show of hands, and the distrust felt by the average man for the leader of the traitor Alcibiades, the tyrant Critias, and the Philo-Laonian Xenophon. In 399 a poet, Meletus, a demagogue, Anytus (a prominent democratic politician), and an orator, Lycon, presented a formal charge in the Court of the King (Archon): "Socrates is guilty of rejecting the gods of the city and introducing new divinities. He is also guilty of corrupting the youth." The first charge relates to the

"Dæmonion," or divine something, often referred to by Socrates, about which a large and unprofitable literature exists. In Plato it is merely the voice of an inward spiritual tact always operating negatively as a check to actions, however trifling, opposed to the true interests of the soul. Other writers have reported it with superstitious, psychological, or pathological flourishes after their kind. Corruption of youth was the serious charge. The case came before a jury of about 501 members. Socrates declined (the story goes) the professional aid of the orator Lysias, and defended himself in a speech of which the spirit is preserved in the Platonic *Apology*, a masterpiece of art in its seeming simplicity. Condemned by a small majority, he took still higher ground when it came to fixing the penalty, and proposed, so Plato says, that it be maintenance in the Prytaneum (q.v.) as a public benefactor. At the solicitation of Plato, Crito, and other friends, he finally proposed to pay a fine. The jury naturally voted by an increased majority for the alternative penalty of death, which Socrates doubtless expected and was willing to accept as an appropriate crown of martyrdom and a release from the approaching infirmities of age. The rest is told in two immortal dialogues of Plato. The *Crito* shows us Socrates in the interval of respite caused by a religious festival and the absence of the sacred ship at Delos, resisting the importunities of his friends that he should escape by bribing his jailers, and so, as he says, in very deed teaching young men by his example to violate the law. The *Phædo* depicts the long final day spent with friends in conversation on the immortality of the soul, and, the last scene of all, "how bravely and cheerfully the first great martyr of intellectual liberty met his doom."

The self-control which he exemplified and the self-knowledge which he inculcated are the keynote of Socrates' philosophy. The basis of his ethics was the principle or paradox that all vice is ignorance, and that no man is willingly bad. In logic, according to Aristotle, two things may justly be attributed to him; inductive arguments and the quest for general definitions. But, as he left no writings, we cannot tell what system of thought, if any, he constructed on these presuppositions and by this method. We may divine that he was much more than the homely Johnsonian moralist of Xenophon's *Memorabilia*, and something less than the poetic dialectician and metaphysician of Plato. But we cannot know. Plato was a cunning dramatic artist, and the seeming simplicity of Xenophon's *Memorabilia* is no warrant of its historical fidelity. Ten years of adventure presumably separate Xenophon from the conversations which he professes to record. Both the *Memorabilia* and the minor Platonic dialogues doubtless contain many genuine reminiscences of the "real Socrates." But we cannot use them to construct a body of doctrine for him. The tremendous influence of his personality remains one of the great facts of history. Through the "complete Socratic" Plato and his pupil, Aristotle, he determined the entire subsequent course of speculative thought. The "imperfect Socratics," the founders of the other schools of ancient philosophy, drew their inspiration from partial aspects of his character. The Socrates who wore one garment summer and winter, walked barefoot on the snow, and exclaimed at the fair,

"How many things there are that I do not need," became through Antisthenes the author of the Cynic way of life and the Stoic philosophy. The Socrates who was all things to all men was the model of Aristippus, the founder of the Cyrenaic (and Epicurean) philosophy of experience and pleasure. The ideal Socrates depicted in the Platonic *Apology*, *Crito*, *Gorgias*, and *Phædo* became, in the decay of the old religions, the chief religious type of the ancient world, and to such moralists as Epictetus, Seneca, and Marcus Aurelius the very embodiment and guide of the higher life.

Reichel, 3d ed., London, 1885), the best authority accessible to the English reader; Joel, *Der echte und der xenophontische Socrates* (Berlin, 1901), an attempt to extract the "real Socrates" from Xenophon's *Memorabilia*; also: J. H. Hyslop, *Ethics of the Greek Philosophers* (New York, 1904); J. T. Forbes, *Socrates* (ib., 1905); Theodor Gomperz, *Greek Thinkers*, vol. ii (Eng. trans., ib., 1905); W. C. Wright, *A Short History of Greek Literature* (ib., 1907); P. E. More, "Socrates," in *Shelburne Essays, Sixth Series* (ib., 1909); Ritter-Preller, *Historia Philosophiæ Græciæ* (9th ed., Gotha, 1913); "Sokrates," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914); John Burnet, "Thales to Plato," in *Greek Philosophy: part i* (London, 1914); also general histories of Greek philosophy.

**SOCRATES**, surnamed SCHOLASTICUS (c.380 A.D.-?). A Greek Church historian, born and educated at Constantinople. He was by profession a lawyer. In his later years he traveled in Paphlagonia and Cyprus. His work on church history, *Ἐκκλησιαστικὴ ἱστορία*, appeared in seven books about 439. Intended as a continuation of the work of Eusebius, it covers the period 305-439 and for that period furnishes one of the three chief sources of church history (the other two being the works of Sozomen and Theodoret, qq.v.). The work deals particularly with the ecclesiastical disputes of the period. It appears in English in *A Select Library of Nicene and Post-Nicene Fathers of the Christian Church*, second series, vol. ii (New York, 1890-1904), edited by Philip Schaff and Henry Wace. For information on the life of Socrates consult the introductions to the Cambridge edition of his work by G. Reading (1720) and the Oxford edition by R. Hussey (1853), reproduced by W. Bright (1878). On his work consult F. A. Holzhausen, *De Fontibus Quibus Socrates, Sozomenus, ac Theodoretus in Scribenda Historia Sacra Usi Sunt* (Güttingen, 1825), and Franz Geppert, *Die Quellen des Kirchen historikers Socrates Scholasticus* (Leipzig, 1898).

**SOCRATES, PRISON OF.** The name popularly given to three chambers hewn in the face of the hill of Philopappus at Athens.

**SODA** (It. *soda*, soda), or **SODIUM CARBONATE**,  $\text{Na}_2\text{CO}_3$ . A white solid substance having a strong alkaline reaction and crystallizing with 10 molecules of water,  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ . In commerce it appears both with and without water. Crystallized, hydrated sodium carbonate, also called "sal soda," is the common washing soda; sodium bicarbonate, or "acid" sodium carbonate,  $\text{NaHCO}_3$ , is the common cooking soda, an important constituent of all baking powder. The dry carbonate,  $\text{Na}_2\text{CO}_3$ , is used in enormous quantities in the manufacture of glass and

soap. Native sodium carbonate, or "sodium sesquicarbonate,"  $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$ , is found to some extent in all dry regions, notably in Hungary, Egypt, and the deserts of Africa, Asia, and North and South America, but in no other country does it occur in greater quantities than in the region lying east of the Sierra Nevada Mountains. The mineral is known as *natron*, *trona*, or *urao*. Formerly most of the sodium carbonate of commerce was derived from the ashes of certain plants, chiefly barilla and kelp, but at the present time the quantity derived from all other sources is insignificant when compared with that manufactured from common salt.

Natural soda, which is the residue obtained by the evaporation of natural alkaline waters without the aid of artificial heat, occurs as white incrustations on the alkali plains; the most important deposits, however, are in the form of "sinks" or lakes without outlet, in which the leachings and drainings of the alkali plains have been collected and concentrated. In the United States the waters of three lakes alone, Albert Lake in Oregon and Mono and Owens lakes in California, are estimated to contain more than 118,000,000 tons of sodium carbonate and nearly 30,000,000 tons of sodium bicarbonate. Owing to the great distance from large eastern markets and the consequent high freight charges, this immense supply of raw material for the manufacture of the various sodium salts has not entered into successful commercial competition with the brine deposits of the eastern States. Soda ash is the most important of these products, while caustic soda ranks next. The total tonnage of the soda products in 1909 was more than five times and the value more than three times that in 1889. The quantities and values of sodium compounds produced in the United States during 1909, according to the Thirteenth Census, are given in the subjoined table:

PRODUCTS	Tons	Value
Soda ash . . . . .	646,007	\$10,361,756
Sodium bicarbonate . . . . .	82,800	1,515,031
Caustic soda . . . . .	112,152	4,230,954
Borax . . . . .	20,154	1,766,910

**Manufacture of Sodium Carbonate.** Sodium carbonate is manufactured commercially by several processes, of which only two are of importance—the Leblanc process and the Solvay process, each named from its respective inventor.

The French Academy of Sciences in 1775 offered a prize for a method of making sodium carbonate from salt. Among the processes submitted was that of Nicolas Leblanc, which was of promising merit, and, being granted a patent in 1791, he began the manufacture on a commercial scale. The Leblanc process is regarded as the most important discovery in the entire range of chemical manufactures, and has furnished about one-half of the world's supply of soda. The fact that it produces both hydrochloric acid and bleaching powder as by-products has enabled it to survive competition, but the introduction of electrolytic processes, which also yield bleaching powder as a by-product, is a serious menace to its future.

The Leblanc process consists of three stages: 1. The conversion of common salt (sodium

chloride) into sodium sulphate by the action of sulphuric acid, accomplished by the aid of heat in a reverberatory furnace. This stage is called the saltcake process, "salt cake" being the technical name applied to the sodium sulphate product. Two chemical reactions are involved in this stage, viz.:

2. The decomposition of the sodium sulphate, by means of calcium carbonate and coal, at a high temperature in a furnace, the result being a crude product known as "black ash," which consists of sodium carbonate, calcium sulphide, calcium oxide, calcium carbonate, and small quantities of other substances. The principal reactions taking place in this stage of the process may be expressed by the following chemical equations:

3. The extraction of the sodium carbonate by treating the black ash with water to dissolve the sodium salt, which yields a solution called "tank liquor," containing also sodium hydrate. The crystals of sodium carbonate are obtained ultimately by evaporation, and, when calcined, yield the dry sodium carbonate of commerce, technically known as soda ash. The calcium sulphide remaining undissolved in the residues is treated for its sulphur content, and the hydrochloric acid produced in the first stage of the Leblanc process is saved for use partly as such, partly for making bleaching powder. In this manner from first to last there is practically nothing wasted except the calcium.

The transformation of the salt cake into black ash is generally carried out in a reverberatory furnace (Fig. 1), called a "black-ash" or "balling furnace." Usually 100 pounds of salt cake, 100 pounds of calcium carbonate, and 50 pounds

FIG. 1. LONGITUDINAL SECTION OF A BLACK-ASH FURNACE.

of coal dust form a charge. The hand-worked furnace is a long reverberatory with a hopper in the roof through which the charge is dropped into the first hearth near the flue where the heat is not very high; after thorough drying and heating, the material is raked down onto the second or "balling hearth," where the temperature is usually about 1000° C., and thoroughly rabled until it becomes a thick, pasty mass from which carbonic acid gas escapes freely. As soon as the salt cake is decomposed, the charge begins to stiffen and carbon monoxide (CO) is evolved, as is shown by jets of blue flame (the carbonic oxide is produced by the action of coal on the excess of calcium carbonate present). The charge is then raked into a ball and removed from the furnace to an iron truck, the escaping bubbles of gas causing the pasty mass to become porous. The shallow iron pan between the furnace hearth and the flue to the chimney is used for the evaporation of the tank liquor obtained by the lixiviation of

the black ash in the third stage of the process. The furnace operation is quite difficult, and although the heavy tools are suspended by chains, the temperature is so intense that the quantity a man can handle at one time is limited to 300 pounds. In order to eliminate expensive hand labor and to work larger charges, revolving cylindrical black-ash furnaces are used; the common size, 18 feet long and 10 or 12 feet diameter, can treat as much as three or four tons of salt cake in two hours. The lixiviation of the black ash is accomplished in a series of terraced tanks each with a false bottom perforated with small holes. The uppermost tank is charged with black ash, and water added to cover the charge; the solution of sodium carbonate formed, being heavier than water, sinks to the bottom of the tank and is passed through the perforations, and is withdrawn by means of a pipe which delivers it to the second tank in the series, through which it passes to the third tank, etc. The operation is continuous, fresh water being added to the nearly exhausted ash in the uppermost tank to yield an unbroken flow of strong liquor. Good tank liquor contains approximately 23.5 per cent of sodium carbonate and sodium hydrate.

The Solvay process, or "ammonia-soda process," is based on the fact that hydrogen-ammonium carbonate,  $(\text{NH}_4)\text{HCO}_3$ , is decomposed by a strong solution of common salt, yielding sodium bicarbonate and ammonium chloride, as shown by the equation:

The brine is first saturated with ammonia gas, and the cooled ammoniacal liquor is subsequently charged in carbonating towers with carbonic acid gas under moderate pressure; the sodium bicarbonate, being much less soluble, separates and leaves the more soluble ammonium chloride in solution, from which the ammonia is subsequently recovered by treatment with lime. The sodium bicarbonate is converted into sodium carbonate by calcination, and the carbonic acid gas evolved is again utilized to carbonate a second quantity of ammoniacal brine. In this cycle of operations no sulphuric acid is required and no hydrochloric acid is evolved.

The reactions involved in the ammonia-soda process were known to a German chemist, Vogel, as early as 1822. They were patented by H. C. Dyar and T. Hemming about 1838, but the process was not perfected until 1873. In 1863 Ernest Solvay (q.v.), a Belgian manufacturing chemist, constructed the first successful plant, which has led to an enormous development of the industry.

**Sodium Hydroxide, Sodium Hydrate, or Caustic Soda, NaOH.** This is of importance next to sodium carbonate only, on account of its use in enormous quantities in refining fats and vegetable oils, and in the manufacture of soap. In appearance it is a white solid, strongly caustic and highly deliquescent. It is readily soluble in water, with evolution of heat, and by cooling a concentrated solution to 8° C., a deposit of crystalline sodium hydrate  $(2\text{NaOH} + 7\text{H}_2\text{O})$  is obtained.

Sodium hydroxide is one of the strongest alkalies known. On a large scale it is manufactured by the action of milk of lime (calcium hydrate) upon a boiling solution of sodium carbonate, whereby calcium carbonate is precipi-

tated, and sodium hydrate remains in the solution. The reaction is

After the removal of the solid calcium carbonate the solution is evaporated, and finally yields the solid sodium hydrate. One of the chief sources

FIG. 2. DIAGRAMMATIC SKETCH OF THE "BELL" TYPE OF GRAVITY CELL.

of supply is the tank liquor, produced in the manufacture of sodium carbonate by the Leblanc process (see above). The tank liquor, containing essentially sodium carbonate and sodium hydrate, is heated to boiling and an excess of lime is stirred into the mixture. The sodium sulphide present in the tank liquor is oxidized to sodium sulphate by the combined action of air injected into the mixture and of sodium nitrate, which is added for the purpose.

Sodium hydrate has been manufactured to a considerable extent by the electrolysis of brine, also by the direct electrolysis of fused common salt. The two best known electrolytic processes are the Aussig "bell process" and the Acker process. The former has been under development at Aussig. The broad features of the method are illustrated in Fig. 2. In this diagram, *a* represents the anode, *b* the solution of common brine which forms the electrolyte, *d* the bell, and *c* the cathodes; *e* is the pipe through which fresh brine is supplied and *g* serves to carry away the chlorine gas. The caustic alkali solution overflows through the pipe *f*. A current efficiency of from 85 to 90 per cent is claimed and the strength of the alkali solution varies between 100 and 150 grams of caustic soda per liter.

In the Acker fusion process, which is employed at Niagara Falls, N. Y., the electrolyte consists of fused salt and the cathode of molten lead; a diagrammatic sketch of the cell is shown in Fig. 3. *K* represents the connections between the bus bar and the anodes *G*, *F* the cell walls, *H* the upper level of the fused salt electrolyte, which overlies the molten lead cathode *I*. A steam jet at the side of the cell circulates the

molten lead cathode, and the decomposition of the lead-sodium alloy produced is accomplished in a separate vessel.

**SODA WATER.** A form of aerated water charged with carbonic acid gas and used either plain or in combination with various flavoring sirups and other materials as a beverage. The first use of fruit syrups with soda water is credited to Eugene Roussel, the proprietor of a perfumery establishment in Philadelphia, early in the nineteenth century. Somewhat later John Matthews of New York began the manufacture of soda water apparatus with a wooden generator, gasometer and pump, while the ornamental soda water fountain is said to be the invention of G. D. Dows, of Massachusetts. After being used extensively in the United States, selling at about \$225 each, the soda water fountain was exhibited at the Paris Exposition of 1867, a date that marked the introduction of soda water in Europe. Ice cream soda water was a later development, being attributed to Robert M. Green, while the Philadelphia Centennial Exposition of 1876 saw not only the industry firmly established but the general use of soda water as a beverage. See AERATED WATERS; BOTTLING.

**SODDY, FREDERICK** (1877- ). A British chemist, born in Eastbourne, England. He studied at Eastbourne College, the University College of Wales, and Merton College, Oxford, and also under Sir Ernest Rutherford (q.v.) in Montreal and with Sir William Ramsay (q.v.) in London. He was demonstrator of chemistry in McGill University during 1900-02; lecturer in chemistry and radioactivity in Glasgow during 1904-14; and thereafter was professor of chemistry in Aberdeen. He was president of the Röntgen Society during 1905-06, was elected a fellow of the Royal Society in 1910, and was awarded the Cannizzaro Prize by the Accademia dei Lincei, Rome, in 1913. His special field is radioactivity (q.v.), and he

FIG. 3. CROSS SECTION OF THE ACKER ELECTROLYTIC FURNACE FOR ALKALI.

published: *Radioactivity, an Elementary Treatise from the Standpoint of the Disintegration Theory* (1904); *The Interpretation of Radium* (1909); *Matter and Energy*, in the "Home Uni-

versity Library Series" (1912); *Chemistry of the Radio-elements* (1912-14).

**SODEN**, zō'den, (HANS KARL) HERMANN, BARON VON (1852-1914). A German Protestant theologian and pastor, born in Cincinnati, Ohio. He was educated at Esslingen, Urach, and Tübingen, and was a vicar in various places from 1875 to 1880. From 1880 to 1882 he was a pastor in Dresden, then in Chemnitz (1882-86), and in 1887 he took charge of the Jerusalemkirche in Berlin. In 1893 he was appointed associate professor of theology in the University of Berlin. Baron von Soden spent 20 years, with the assistance of other scholars, in collecting and comparing manuscripts of the New Testament. He asserted that the Greek text read at present is not essentially different from the earliest versions. His publications include: *Philippbriefe* (1890; 2d ed., 1909); *Palästina und seine Geschichte* (1899; 3d ed., 1910); *Reisebriefe aus Palästina* (2d ed., 1901); *Urchristliche Literaturgeschichte* (1905; Eng. trans., *History of Early Christian Literature*, 1906); *Die wichtigsten Fragen in Leben Jesu* (2d ed., 1909). He also contributed vol. iii to the *Handkommentar zum Neuen Testament* (1890).

**SÖDERBERG**, sē'dēr-bēr'j, HJALMAR EMIL FREDRIK (1869- ). A Swedish author, born in Stockholm. Educated at Upsala, he engaged in journalism, and later entered the customs service, but turned to literature. He showed himself a realistic portrayal of Stockholm life in the story *Förvillelser* (1895), followed by *Historietter* (1898); the romances *Martin Birck's ungdom* (1901) and *Doktor Glas* (1905); the dramas *Gertrud* (1906) and *Aftonstjerner* (1912); *Hjärtats urö* (1909), daily observations; and *Den allvarsamma leken* (1912), a story. His translations of some of Anatole France's work are noteworthy. Söderberg came to be recognized as one of the most important authors of modern Sweden. His humor is negated by underlying pessimism and skepticism.

**SÖDERHAMN**, sē'dēr-hämm'. A seaport of Sweden on a small inlet of the Gulf of Bothnia, 135 miles north of Stockholm (Map: Sweden, F 6). It has flour and saw mills, iron works, breweries and wood pulp factories, and exports timber, iron, and wood pulp. Pop., 1910, 11,412.

**SÖDERTELJE**, sē'dēr-tēl'ye. A town of the Län of Stockholm, Sweden, 15 miles southwest of the city of Stockholm, of which it is practically a suburb (Map: Sweden, F 7). The town is on the Södertelje Canal, which connects Lake Mälär with the Baltic. It is a noted summer resort, with mineral springs. There are machine shops, match factories, and spinning and weaving mills. Pop., 1910, 11,060.

**SÖDERWALL**, sē'dēr-wäl, KNUT FREDRIK (1842- ). A Scandinavian philologist, born at Drängsered in Halland, south Sweden. In 1858 he entered the University of Lund, where he became docent in 1865, adjunct professor in 1872, assistant professor in 1886, and professor of Scandinavian languages in 1892. In the latter year he was also elected to the Swedish Academy. In 1907 he retired from his professional duties in order to devote his entire attention to the great *Ordbok öfver Svenska Språket*, the great dictionary of the Swedish Academy, of which he had become an editor in 1884 and editor in chief in 1892. Though the publication of this work was begun in 1892 (Lund), by

1916 it had only reached the letter E. Among other works of importance published by Söderwall are: *Om verbets rektion i fornsvenskan* (1864); *Hufvudpekerna af svenska Språkets Utbildning* (1870); and his important *Ordbok öfver svenska Medeltidsspråket* (1884-1913).

**SODIUM** (Neo-Lat., from It. *soda*, soda, saltwort, glasswort). A metallic element isolated by Sir Humphry Davy in 1807. (See CHEMISTRY: POTASSIUM) It is one of the most abundant of the chemical elements, the earth's crust containing about two and one-half per cent of it. The chloride of sodium is widely distributed in nature as halite or rock salt, and in solution in sea and other natural waters. Sodium also occurs in the form of nitrate (soda nitre, or Chile saltpetre), which is found abundantly in superficial deposits in the rainless districts of the Pacific coasts of Chile, Peru, and Bolivia; as the sulphate (glauberite) or mirabilite; as the carbonate; and in numerous minerals of more complex composition, such as cryolite, the various feldspars, including albite, labradorite, oligoclase, and the zeolites. Sea plants as well as animal organisms likewise contain sodium salts.

The preparation of the metal itself may be accomplished by decomposing sodium hydroxide by electrolysis. It was first prepared on a large scale by Sainte-Claire Deville, who reduced sodium carbonate with coal and chalk at a white heat, and collected the resulting metallic sodium under coal oil in suitable condensers. A commercial process now extensively employed was invented in 1886 by Castner, and consists in reducing sodium hydroxide by an iron carbide prepared by adding finely divided iron to melted pitch and cooking the mixture in large cylinders. The metal is distilled over into condensers and is purified by passing through linen under petroleum at about 100° C. (212° F.).

Sodium (symbol, Na; atomic weight, 23.00) is a soft white metal possessing a silvery white lustre when freshly cut. Its specific gravity is 0.9712 at 20° C. (68° F.); its melting point is 97° C. (about 207° F.), and it boils at 877.5° C. (1611.5° F.). It is one of the best conductors of heat and electricity, and is one of the most electro-positive metals. Its vapor is colorless when seen in thin layers, but has a purple or violet tinge by transmitted light when seen in quantity. Sodium burns with a bright yellow flame when heated in the air. When thrown into cold water it decomposes it, liberating hydrogen, but not with sufficient heat to ignite the latter, unless the temperature of the water is above 60° C. (140° F.). The metal readily takes up oxygen, and in consequence finds its chief use in the preparation of aluminium, boron, magnesium, and silicon, by reduction from the oxides. Sodium forms alloys with many metals, and the amalgam with mercury is employed in the extraction of gold. It combines with oxygen to form a monoxide (Na<sub>2</sub>O) and a peroxide (Na<sub>2</sub>O<sub>2</sub>), of which the former may be obtained by heating sodium hydroxide with sodium, yielding a gray mass, which melts at a dull red heat; while the latter, which is a white solid that deliquesces in the air, is formed by heating metallic sodium in oxygen.

The salts of sodium are among the most important of the commercial chemicals. Sodium acetate is prepared by treating acetic acid or vinegar with sodium carbonate, filtering the solution and concentrating to crystallization.

Sodium arsenate is prepared by fusing arsenious acid, sodium carbonate, and sodium nitrate, dissolving the resulting mixture in hot water, filtering, and crystallizing. The colorless crystals thus obtained are official in the pharmacopœia and are used in skin diseases and as a substitute for arsenic. Mixed with sugar this salt is frequently employed as a poison for flies. Sodium bromide and sodium iodide, which are prepared by decomposing respectively ferrous bromide and ferrous iodide with sodium carbonate, are white crystalline compounds that find some use in medicine as nervous sedatives. Sodium carbonate, the soda (q.v.) of commerce, is a colorless crystalline odorless compound with a strong alkaline taste, which is found native in many mineral waters and as efflorescences in the neighborhood of soda lakes. Sodium bicarbonate, or "acid" sodium carbonate, is a colorless compound which finds extensive use in the manufacture of baking powders and of artificial mineral waters, and also in medicine as an antacid. (See SODA.) Sodium hypophosphite is prepared by treating calcium hypophosphite with sodium carbonate and recrystallizing the resulting product from alcohol. It forms small colorless crystals that are deliquescent and finds some use in medicine as a restorer in exhausted conditions of the nervous system and as an ingredient in the syrup of hypophosphites. Sodium hyposulphite, or more correctly sodium thiosulphate, is prepared by decomposing soluble calcium thiosulphate with either sodium sulphate or sodium carbonate, resulting in the formation of a colorless crystalline compound that is efflorescent in dry air, and is used in photography as a solvent for the unaltered silver chloride or bromide on the film, and in medicine as an alterative and resolvent. Sodium silicate is prepared commercially by fusing sodium carbonate with sand and a small quantity of charcoal in a reverberatory furnace and then dissolving by prolonged boiling in water. (See WATER GLASS.) Sodium sulphite is obtained by passing gaseous sulphur dioxide into a solution of sodium carbonate and evaporating the mixture to dryness or crystallization, resulting in a colorless, transparent, efflorescent compound that is used as a bleaching agent under the name of "antichlore," in the manufacture of paper, for the purpose of removing the last traces of chlorine from the bleached pulp; it is also employed in medicine as an antiferment. Sodium hyposulphite, a powerful reducing agent used in dyeing and calico printing, is prepared from acid sodium sulphite. See also GLAUBER'S SALT; SALT; SALTPETRE; SODA; ETC.

**SODIUM, MEDICAL USES OF.** Sodium compounds are extensively used in medicine. Among the most important are sodium hydroxide or caustic soda, which is applied externally to destroy excrescences on the skin and as a caustic generally. Sodium acetate is a valuable diuretic; sodium bicarbonate alkalizes the blood and secretions, and is used as a corrective in functional diseases of the stomach; sodium cacodylate is employed in anemia, chorea, and malaria; sodium hypophosphite is given in wasting diseases in combination with other hypophosphites; sodium iodide is an alterative and replaces the potassium salt when the latter is too irritating; sodium sulphate is a saline purgative commonly known as Glauber's salt; sodium thiosulphate is an antiseptic. See also BROMIDES; SALICYLATES.

**SODIUM HYPOCHLORITE, SOLUTION OF.** See LABARRAQUE'S SOLUTION.

**SODIUM PHOSPHATE.** See PHOSPHATES.

**SODIUM SULPHATE.** See GLAUBER'S SALT.

**SOD'OM** (Heb. *Sēdōm*) and **GOMOR'RAH** (Heb. *āmōrah*). Two ancient cities near the Dead Sea, almost invariably spoken of together in the Bible. With Admah, Zeboiim, and Zoar, they formed the five "cities of the plain," which on account of the wickedness of their inhabitants are said to have been destroyed by a rain of brimstone, perhaps also accompanied by an earthquake. Lot and his family were the only ones who escaped. His wife, however, for disobedience was turned into a pillar of salt (Gen. xix. 1-29; Deut. xxix. 23; Zeph. ii. 9; Isa. i. 9). Some scholars say the cities were at the northern end of the Dead Sea, others at the southern end. Names like Jebel Usdum (Sodom) and Zoara or Zughar (Zoar), at the southern end, point to a tradition of the existence of the cities there. The biblical story of the destruction of the cities is considered by many critics similar to tales found among Arabs (and other nations) regarding the sudden disappearance of places. Those who thus deny the literal truthfulness of the narrative call attention to the weird character of the district around the Dead Sea, fatal to plant and animal life, as naturally suggesting the thought of some catastrophe. See LOT.

**SODOM, APPLE OF.** A name sometimes given to the fruit of *Solanum sodomœum*. Many unsatisfactory attempts have been made to determine the source of the true apple of Sodom or mad apple of the Dead Sea region mentioned by Strabo, Tacitus, and Josephus, and described as beautiful to the eye, but filling the mouth with bitter ashes if tasted. One explanation is that it is a kind of gall (see GALLS) growing on dwarf oaks. These beautiful, rich, glossy, purplish-red galls are about 2 inches long and 1½ inches in diameter, and are filled with an intensely bitter, porous, and easily pulverized substance. Some writers believe the fruit of *Calotropis procera* is the fruit so named. See MUDAR.

**SODOMA, IL**, properly GIOVANNI ANTONIO BAZZI (1477-1549). An Italian painter of the High Renaissance. He was born at Vercelli (Piedmont) and, after training with obscure local masters, came under the influence of Leonardo da Vinci at Milan. In 1501 he was established at Siena, the city with which he was chiefly identified for the remainder of his life. In 1507 or 1508 he visited Rome and was commissioned by Pope Julius II to paint frescoes in the Camera della Segnatura of the Vatican. Of these only one on the ceiling remains, all the rest having been removed to make way for the frescoes of Raphael, who painted Sodoma's portrait beside his own in "The School of Athens." On his second visit to Rome he lived with Agostino Chigi and painted in Chigi's Villa Farnesina the effective frescoes the "Marriage of Alexander and Roxana," his most beautiful picture of an antique subject, and "Alexander in the Tent of Darius." He was made a knight by Leo X. In 1515 he returned to Siena, where he spent most of the remainder of his life.

Sodoma is best represented by his frescoes at Siena, where, after his Roman period, he painted a large "Flagellation" for San Francesco, the "Ecstasy" and the "Swoon of Saint Catharine"

in San Domenico, a "Nativity" in Sant' Agostino, and a large altarpiece in Santo Spirito. In the Convent of Monte Oliveto, near Siena, is a series of twenty-five scenes from the life of Saint Benedict, belonging to the artist's early period. His panel paintings include a "Saint Sebastian" in the Uffizi, a perfect representation of "suffering, refined and spiritual," and "Ascension" at Naples; a "Sacrifice of Abraham" at Pisa; a "Caritas" at Berlin; and the well-known "Leda and the Swan" in the Borghese Gallery, Rome. Sodoma's influence on the Sienese school was marked and resulted in a new manner. He possessed the power to express tenderness, sensuous grace, and an exalted sweetness and suffering, but lacked in composition and in a convincing rendition of individual figures. Consult: Jansen, *Leben und Werke des Malers Giovanantonio Bazzi von Vercelli* (Stuttgart, 1870); Frizzoni, in *Nuova Antologia* (Rome, August, 1871); R. H. H. Cust, *Giovanni Antonio Bazzi, styled "Sodoma," the Man and the Painter, 1477-1549* (New York, 1906); *Masters in Art*, vol. 7 (Boston, 1906).

**SODOMY.** The unnatural carnal intercourse of persons with each other or with beasts; so called from the form of vice practiced in the ancient city of Sodom. It is punished by death or long imprisonment in all civilized countries.

**SOEMMERRING**, zē'mēr-ing, SAMUEL THOMAS VON (1755-1830). A German anatomist and physiologist, born at Thorn, educated at Göttingen, and chosen professor of anatomy at Kassel in 1778 and at Mainz in 1784. He defended the theory that the nerves act independently of the brain, and he considered the brain as not essential to life. His division of the cranial nerves into twelve pairs instead of nine is generally adopted. His principal works were: *De Basi Encephali et Originibus Nervorum*, etc. (1778); *Vom Hirn- und Rückenmark* (1788); *Vom Baum des menschlichen Körpers* (1791-96); *Ueber das Organ der Seele* (1796); and *De Morbis Vasorum Absorbentium Corporis Humani* (1795).

**SOERABAYA.** See SURABAYA.

**SOERAKARTA.** See SURAKARTA.

**SOEST**, zōst. A town in the Province of Westphalia, Prussia, 84 miles southeast of Münster (Map: Germany, C 3). Relics of its mediæval splendors still survive in its churches. Of these the finest is the "Meadow Church," restored in 1850-52. The tenth-century Romanesque cathedral has excellent mural paintings. The manufactures include machinery, cigars, tinware, bricks, sugar, and lamps. There are markets for cereals and cattle. In the Middle Ages Soest was an important member of the Hanseatic League, and had a population of over 25,000. Its municipal law, the *jus Susatense*, was the oldest in Germany and served as the model for the other Imperial free towns, Lübeck, Hamburg, etc. Pop., 1900, 16,724; 1910, 18,467.

**SOETBEER**, zēt'bār, ADOLF (1814-92). A German economist, born at Hamburg. In 1840 he became librarian and in 1843 secretary of the Hamburg Chamber of Commerce, where he laid the foundation of the excellent system of commercial statistics for which Hamburg became noted. He published *Denkschrift über Hamburgs Münzverhältnisse* (1846) and subsequently numerous monographs and pamphlets, defending the cause of gold monometallism. Until his death he ranked as the leading de-

fender of the single gold standard, the adoption of which by Germany was brought about largely through his efforts. Among his most important works are: *Denkschrift betreffend die Einführung der Goldwährung in Deutschland* (1856); *Zur Frage der deutschen Münzeinheit* (1861); *Beiträge zur Geschichte des Geld- und Münzwesens in Deutschland* (1862); *Edelmetallproduction und Wertverhältnis zwischen Gold und Silber seit der Entdeckung Amerikas bis zur Gegenwart* (1879); *Materialien zur Erläuterung und Beurteilung der wirtschaftlichen Edelmetallverhältnisse und der Währungsfrage* (1885).

**SOFALA**, sō-fā'la. A name applied formerly to a considerable part of Portuguese East Africa (q.v.), but confined at present to a single district under the administration of the Mozambique Company (Map: Africa, H 7).

**SOFIA**, sō'fē-ā, commonly sō-fē'ā, or **SOPHIA** (Bulg. *Sredets*). The capital of the Kingdom of Bulgaria, situated in a plain at an altitude of about 1800 feet between the Vitosha Mountains and the main Balkan chain, 206 miles southeast of Belgrade and 300 miles northwest of Constantinople (Map: Balkan Peninsula, D 3). It has been largely rebuilt since 1878 and has a modern appearance with electric lighting and street railways and creditable public buildings. In old Sofia are the ruined Sofia Mosque, the Buyuk-Jami, now used as a national museum and library, and the vast baths with hot springs. The principal modern buildings are the royal palace (1880-82, subsequently enlarged), the university buildings, the cathedral of Saint Alexander, the house of Parliament, the various administration buildings, and the large theatre (1906). Sofia has a university (founded in 1888) with 65 teachers and about 1600 students in 1910, secondary schools, and a military school and college. It is the industrial centre of Bulgaria and has manufactures of silk, cloth, tobacco, etc. Situated at the converging of the principal highways of the Kingdom and connected by rail with Constantinople, Belgrade, and Saloniki, the city is well adapted for its prominent position as a commercial centre, and has an extensive export trade in agricultural products, hides, and attar of roses. The population was 30,928 in 1887, 67,789 in 1900 (including Poduene, and annexed in 1895), and 102,812 in 1912, of which 83,403 were Orthodox, 12,852 Jewish, 2690 Roman Catholic, and 2440 Mohammedan. Sofia is identified with the *Serdica* or *Sardica* of the Romans, which became the capital of *Dacia Ripensis*, and about 344 was the seat of a Church council. The town was plundered by the Huns in the fifth century and at the beginning of the ninth century it was taken by the Bulgarians. In 1382 it passed to Turkey. In 1878 it was occupied by the Russians under Gurko. It was bombarded by allied airships in the Great War which began in 1914. See WAR IN EUROPE.

**SOFTA**, sōftā (Turk. *sōfta*, from Pers. *sōr-tah*, *sūwtah*, burned [with zeal]). The name applied in Turkey to the students of the theological schools. They are drawn largely from the lower classes and are as a rule opposed to Occidental ideas. Because of this they have often opposed the Turkish government. From them are appointed the Mollahs and the Ulemas (qq.v.). There are now about 16,000 Softas in Constantinople.

**SOFTENING OF THE BRAIN.** See PARESIS.

**SOFT GRASS** (*Holcus*). A small genus of grasses. The English name is derived from the soft and abundant pubescence of the two British species, creeping soft grass (*Holcus mollis*) and oolily soft grass, meadow soft grass, or elvet grass (*Holcus lanatus*). They are common in Europe and *Holcus lanatus* is also found from Nova Scotia to Illinois and southward. The latter species is found most abundantly on damp soils, on which it is sometimes sown for forage. The former is generally found on dry, sandy, or other light soils.

**SOFT-GROUND ETCHING.** A species of etching in which the ground ordinarily used is softened by a mixture with tallow. It is not much used, because the same effects can be obtained by lithography and heliographic processes.

**SOFT-SHELLED TURTLE.** Any of various fresh-water turtles of the family Trionychidae, represented in the United States by the two genera *Amyda* and *Aspionectes*. They are named from the leathery consistency of the shell, even in the common soft-shell (*Aspionectes vocifer*), about 12 inches long. Another species, the leather turtle, is *Amyda mutica*. They are omnivorous, web-footed, entirely aquatic, with long serpentine necks. The eggs are laid near shores. Drought and winter are spent in muddy bottoms. Their flesh is said to be of superior quality.

**SOGDIA'NA** (Lat., from Gk. Σογδιανή, *Sogdianē*, Av. *Suyda*, Pers. *Suyd*). An ancient country in Central Asia, comprising part of modern Turkestan, with the Jaxartes on the northeast separating it from Scythia, and the Oxus on the southwest separating it from Bactria. It was conquered by the Persians in the reign of Cyrus and was invaded by Alexander the Great. Afterward it fell into the power of the Seleucidae (q.v.).

**SOGNE FJORD**, søgné fyörd. An inlet in the Province of North Bergenhus, in western Norway (Map: Norway, C 6). It pierces the land for a distance of 110 miles, in some places to a depth of 4000 feet, and is shut in throughout its length by perpendicular walls conveying the impression of wild grandeur.

**SOHN, zōn**, KARL FERDINAND (1805-67). A German painter of the Düsseldorf school. He was born in Berlin and studied there under Wilhelm von Schadow, whom he followed to Düsseldorf. He treated principally mythical and poetic subjects of a highly romantic character, and painted in the mechanically idealistic manner of the Düsseldorf school. In 1832 he was made professor in the Düsseldorf Academy, where he exercised an important influence. Among his best-known works are: the "Lute Player" (1832, National Gallery, Berlin); "Tasso and the Two Leonoras" (1839); "Rinaldo and Armida" (Düsseldorf Gallery).

His nephew and pupil, WILHELM (1830-99), born in Berlin, painted at first biblical subjects, and then devoted himself to genre scenes, good in characterization and drawing and of great coloristic charm. Among these are "Consultation at the Lawyer's" (1866, Leipzig Museum) and "Warrior of the Seventeenth Century" (1869, Dresden Gallery).

**SOHO SQUARE.** A square in London (once a fashionable abode), dating from Charles II's reign and earlier called King's Square.

**SOHRAB** (sô-râb') AND RUSTUM, rûs'-tûm. A narrative in blank verse by Matthew

Arnold, based on the Persian legend of Rustam (q.v.).

**SOIL** (Lat. *solum*, ground, soil). A term applied to the superficial unconsolidated portion of the earth's crust (regolith), composed of broken and disintegrated (weathered) rock mixed with varying proportions of decaying organic matter (humus). The processes by which soils are formed from the parent rocks are mechanical and chemical, and sometimes biological. The fertility of a soil is in part determined by the character of the parent rock. Thus granite, richer in the elements of plant food, yields a more fertile soil than the siliceous sandstones.

According to the method of their formation soils are classed as sedentary or transported. When a soil is found resting on its parent rock it is spoken of as sedentary soil. Such formation may show gradual transition from the fully formed soil at the surface to the solid rock beneath. With this class may be grouped the humus or peaty (cumulose) soils due to accumulations of organic matter in bogs, swamps, and marshes. In many cases the residual products have been removed from the place of their formation by the action of water, ice (glaciers), and wind and deposited elsewhere as clayey, sandy, or loamy soils, often representing the mingling of material from several sources. This type is termed transported soil, and, though naturally variable in character, includes some very productive soil. The most important soils of this class are the alluvial soils, such as occur in river and flood-plains (q.v.), and deltas (q.v.), as in the case of the Nile and the Mississippi rivers. In the northern half of the United States much of the soil is of the glacial drift type and represents the debris of rocks of various kinds brought down from the north during the glacial period (q.v.).

**Æolian soils** are those formed by wind action. They include: (1) sand dunes, shifting, sandy soils heaped up by wind action upon ocean coasts and the shores of inland seas and lakes (see DUNE; DUNE VEGETATION); (2) ash soils, the accumulations of ashes ejected by volcanoes. The deposits are often of considerable extent and are frequently very fertile. Much highly productive soil around Mount Vesuvius is of this kind. Such soils are also found in Nebraska, Colorado, and Montana. There have been notable recent examples of the formation of such soils in connection with the eruptions of Soufrière, St. Vincent, in 1902-03 and Katmai, Alaska, in 1912. Soils from disintegration of volcanic lava are of frequent occurrence, as, e.g., in Italy, in the Hawaiian Islands, and in Idaho and other northwestern States. The loess soils of China and other countries are of æolian origin, though the so-called loess soils of America are believed to be generally alluvial.

Soils containing an excess of soluble salts are found scattered throughout regions of deficient or irregular rainfall and are known as alkali soils (q.v.). Humous, peaty, or moor soils are composed largely of organic matter. The purest types are represented by accumulations of peat (q.v.) formed in ponds and swamps; marine marshes and muck soils represent a less pure variety. When properly drained and aerated and freed from excess of soluble salts, they often prove very productive.

In practice soils are classified as gravelly, sandy, loamy, clayey, calcareous, humus, or

peaty, etc., distinctions based on the fineness of the soil particles and the relative proportions of sand, clay, lime, and humus which they contain. Soils are also frequently classed as light and heavy, according to ease or difficulty of tillage. In this sense a sandy soil is termed light (easy to till), although actually having greater weight than a clayey soil, which is termed heavy (difficult to till). The productiveness of a soil depends chiefly upon its chemical composition and its physical and biological properties. Chemical and physical or mechanical analysis separates soil constituents into two general classes: (1) plant food constituents and (2) physical constituents. The food constituents considered necessary to plant growth are nitrogen, sulphur, phosphorus, calcium, magnesium, potassium, iron, and probably manganese, in various forms of chemical combination. The physical constituents, constituting the larger proportion (90 to 95 per cent) of the entire soil mass, act as a mechanical support to plants and furnish a medium for root growth but have little more than an indirect value as fertilizing agents. As a rule they consist very largely of silica.

**Chemical Properties.** The average chemical composition of soils of humid and arid regions is shown in the following table:

AVERAGE CHEMICAL COMPOSITION OF SOILS  
HUMID, SEMIARID, AND ARID REGIONS OF THE UNITED STATES (HILGARD)

CONSTITUENTS	Humid region (average of 696 soils)	Semi-arid (transition) region (average of 178 soils)	Arid region (average of 573 soils)
	Per cent	Per cent	Per cent
Insoluble matter . . .	84.17 } 88.21	75.04 } 83.50	69.16 } 75.87
Soluble silica . . .	4.04 }	8.46 }	6.71 }
Potash . . . . .	.21	.33	.67
Soda . . . . .	.14	.32	.35
Lime . . . . .	.13	.70	1.43
Magnesia . . . . .	.29	.47	1.27
Iron oxide . . . . .	3.88	2.08	5.48
Alumina . . . . .	3.66	4.57	7.21
Manganese oxide . . .	.13	...	.11
Phosphoric acid . . .	.12	.21	.16
Sulphuric acid . . . .	.05	.02	.06
Humus . . . . .	1.22	3.24	1.13
Nitrogen in humus . .	*	6.67	12.50
Nitrogen in soil . . .	....	.22	.13

\* Less than 5 per cent.

Actual fertilizing constituents, viz., potash, phosphoric acid, nitrogen, lime, etc., are relatively small, arid soils showing larger proportions than humid soils. Other mineral constituents are usually present in sufficient quantity to supply the needs of plants. Humus (q.v.) is important as a soil constituent not only on account of its beneficial effect on the physical properties of soils, but as a source of nitrogen, as well as of available phosphoric acid, potash, lime, etc. The nitrogen of humus is converted into a form (nitrate) available for plants by the process of nitrification (q.v.). Humus may be said to be the final visible product of decomposition of organic matter in the soil, in the course of which a great variety of organic compounds, some beneficial, some harmful (toxic) to plant growth, are produced.

**Physical Properties.** Physical properties of soils of special importance are color, weight, fineness of division or texture, structure or arrangement of particles, adhesiveness, and relations to gases, heat, moisture, and dissolved

solids. Variations in these properties determine to a large extent the productiveness of soils. Good tilth and texture, with accompanying good water conditions, aeration, and temperature, are fully as essential to plant growth as an adequate supply of plant food and moisture, a measure be controlled by man. Physical properties of soils are so largely dependent on their natural character, and can be modified to such a limited extent by man, that it is of great importance to select soils with special reference to the natural suitability of their physical characteristics to the crop to be grown. This is one of the main purposes and advantages of comprehensive soil surveys which have been actively carried on in the United States and many other countries. The physical properties of soils are determined also by the proportion they contain of stones, gravel, sand, clay, and organic matter. A sandy soil is dry, warm, and easy to work, but as a rule naturally poor with little absorptive power. A clayey soil is apt to be cold, wet, and difficult to till, but to have high absorptive power. Clayey soils usually contain more plant food than sandy soils. Humus makes soils light in weight and dark in color and greatly increases absorptive power. Lime not only has value as a plant food, but improves the structure of soils and corrects acidity. It also promotes the decomposition of organic matter and aids nitrification and other biological activities. Mechanical analysis, which separates the particles of a soil into six or more grades of fineness ranging from stones and gravel through sand and silt to clay, furnishes a valuable means of securing data for judging of physical properties of soils.

The productiveness of a soil depends largely upon its texture and structure, the size of the particles and their arrangement. These determine the circulation of water, gases, solution and retention of plant food, and the growth of plant roots. When the grains are single or separated the soil is said to be a puddled structure, while a compound of the soil grains gives a flocculated structure. The latter is desirable in all good soils, as it increases the pore space and facilitates the circulation of air and water through the soil. Flocculation may at times be caused by the action of lime. Fertilizers vary in their action, some, like nitrate of soda, producing puddling, others producing flocculation. The finer the particles the greater the injurious effect of puddling, clay soils suffering from this more than sandy soils. Puddling increases the water-retaining power, thus retarding percolation, but may accelerate capillary action of water. Flocculation decreases the retention of water, aids percolation, and may retard evaporation. Water passes more readily from a coarse to a fine layer than from a fine layer to a coarse one—hence when the farmer firms the soil by rolling and then loosens the surface by harrowing, he destroys the capillary spaces and so checks the escape of water to the air. Water is thus held near the surface and is readily accessible to the roots of plants. The action of the mulch (q.v.) depends on this principle. In humid regions the particles of the soil are usually washed down a layer several inches below the surface, the surface layer being called the soil proper and the lower one subsoil. In arid regions the

ference does not exist, but the fine clay particles are evenly distributed throughout the soil layers. Soils vary widely in their absorptive power for water and for fertilizing matter. Of the three principal fertilizing constituents—nitrogen, phosphoric acid, and potash—soils apparently have the least retentive power for nitrogen (in the form of nitrate) and the greatest for phosphoric acid. The relation of soils to water probably more than any other one factor determines their productiveness. Water is not only necessary as a constituent of plant tissue, but it performs a most important function as a solvent and carrier of food in both soil and plant. The temperature of soils is modified by a variety of conditions, e.g., a dark-colored soil is usually warmer than a light-colored one; soils so exposed as to receive a large amount of the direct rays of the sun are warmer than those not thus exposed; dry soils are warmer than wet.

**Biological Properties.** Living organisms—roots of plants, insects, earthworms, etc., but especially the micro-organisms generally known as bacteria—play an important rôle in soil formation and fertility. Bacteria aid in the disintegration of soil-forming rocks and increase the supply of available mineral plant food, fix free nitrogen both directly and in symbiosis with leguminous plants, render organic nitrogen available to plants by nitrification or cause loss of soil nitrogen by denitrification, and in some cases produce substances in the soil which may be either harmful or beneficial according to circumstances. Recent investigation has indicated the practical possibility of curbing the harmful and promoting the beneficial microbiological activities in the soil by various methods of treatment, more especially by partial sterilization of the soil by means of heat or volatile antiseptics.

See CHERNOZEM; HUMUS.

**SOIL AMENDMENTS.** Substances, such as

lime, gypsum, salt, muck, etc., which increase the productiveness of soils without directly supplying any constituent which the plant needs. They act mainly by improving the physical condition of soils, collecting and conserving moisture, setting free latent plant food, and correcting certain faulty conditions, such as acidity and alkalinity.

**SOILING, SOILING CROPS.** Soiling consists in feeding grazing animals in inclosures or in barns with green forage grown especially for them, instead of allowing free pasturage; soiling crops are crops grown for this purpose. Under European conditions stock is frequently fed in barns the year round, but in the United States soiling is usually combined with pasturing, stock being less frequently fed in barns during the summer.

American farmers began to turn their attention to soiling early in the nineteenth century, and agricultural literature shows that about 1840-50 the practice had become general in the eastern and southern States. Crops then used for green forage were grass, clover, corn, oats, cabbage, and roots. The advantages of soiling are many. It requires far less land to sustain a given number of farm animals than under pasturing; feeding green forage in the barn or yard eliminates the expense of pasture fencing and greatly diminishes food waste, the animals being assured sufficient feed at all times. Practically the only serious disadvantage is the extra labor involved.

Since animals kept in the barn seem to require exercise, the two systems of soiling and pasturing are often combined in the United States. In such cases the soiling crops should be grown remote from the pasture, so that the animals may not become restless and disinclined to graze. The fodder should not be fed in open racks, and the quantity given should never be more than will be eaten at the time.

Soil, climate, and the kind of stock naturally determine the crops to be grown. The purpose of soiling crops is to afford abundance of succulent forage. This is best accomplished with rapidly growing plants that produce large amounts of foliage. A general list of soiling crops includes rape, turnips, sorghum, kafir corn, millet; many cereals, such as rye, barley, oats; many legumes, as corn, clover, cowpeas, alfalfa; and combinations of oats and peas, and barley and peas. Consult: Peer, *Soiling, Soiling Crops, and Ensilage* (New York, 1900); C. V. Piper, *Forage Crops and their Culture* (ib., 1914); United States Department of Agriculture, *Farmers' Bulletins* Nos. 331, 337, 411, 578, 588 (Washington, 1908-14).

**SOISSONS**, swi'sŏn'. An episcopal city and the capital of an arrondissement in the Department of Aisne, France, 65 miles north-east of Paris, on the Aisne River (Map: France, N., J 3). The principal building is the cathedral of Notre Dame, a composite of the Romanesque and Gothic styles of architecture, founded in the twelfth century. There are also some remains of the great castellated Abbey of Saint Jean des Vignes, where Thomas à Becket found refuge when in exile. A short distance from Soissons is an institute for the deaf and dumb, which occupies the site of the famous Abbey of Saint Médard. Other features include the town hall with a library and a museum; the mediæval Abbaye Notre Dame (built on the site of a convent dating from 660), now utilized

as barracks; and the seminary occupying the old Abbaye Saint Léger. Soissons is in a region extensively engaged in farming, and has a large trade in grain, haricot beans, live stock, etc. The principal manufactures are leather, foundry products, lumber, flannel, and farm implements. Pop., 1901, 13,240; 1911, 14,334. Soissons is one of the oldest towns in France. In the time of the Romans it bore the names of *Noviodunum*, *Augusta Suessionum*, and *Suessiona*. It is famous for the victory (near by) by Clovis in 486 over the Roman general Syagrius, putting an end to Roman dominion in Gaul. It was the capital of the Frankish Kingdom of Neustria. On Oct. 16, 1870, after a bombardment of four days, Soissons surrendered to the Germans. In 1914, although untouched during the German advance to the Marne, the town suffered severely during the bombardments incidental to the Battle of the Aisne, and again in the Battle of Soissons, Jan. 8-14, 1915. See WAR IN EUROPE.

**SOISSONS, LOUIS DE BOURBON, COUNT OF** (1604-41). A French noble, born in Paris. Succeeding to the office of grand master of France and Governor of Dauphiné, he took the part of the Queen Mother, Maria de' Medici, while at the same time making approaches to the Huguenots. He conspired against Richelieu, who had opposed his marriage to Mlle. de Montpensier, and was obliged to flee to Savoy. He was, however, recalled by Louis XIII and took part in the siege of La Rochelle in 1627. In 1636 he again formed a plot against Richelieu, and after its failure fled to Sedan, where he joined an alliance with the Duke de Bouillon, Duke de Guise, and the Spaniards against Richelieu. In July, 1641, they met the royal forces at Marfée, near Sedan, and vanquished them; but at the moment of victory Soissons was killed.

**SOJARO, IL.** See GATTI.

**SOKALSKY, sô-kal'skê, PETER PETROVITCH** (1832-87). A Russian composer and student of Russian folk songs. After studying at the University of Kharkov, he devoted himself to literature, music, and art in general, contributing articles on these subjects to the *Odessa Herald*, of which he was editor. He was not a prolific composer, however, and is known in this field chiefly for his operas *Maria* (based on Pushkin's *Poltava*), *A May Night*, and *The Siege of Dubno* (based on Gogol's *May Night* and *Taras Bulba*), and the cantata *The Fête of Peter the Great*. In the field of musical research he has left two scholarly works, *The Chinese Scale in Russian Folk Music* (1885) and *The Russian Folk Song; its Melodic Structure and Harmonic Peculiarities* (1888, posthumous).

**SOKO, ANTIGONUS OF.** See ANTIGONUS OF SOKO.

**SOKOLOW, sô-kô'lôf, NAHUM** (1859- ). A Hebrew writer and Zionist, born in the Province of Plock, Russian Poland. After 1879 he was editor of *Ha-Zefirah*, an important Hebrew periodical founded by Slonimsky (q.v.), and for this he wrote numerous brilliant essays. He also edited a literary annual, *He-Asif* ("The Collector"), the success of which was phenomenal. Although Sokolow long refused to take sides on the burning issues dividing Judaism, he later became a great leader of political Zionism. His prolific writings include critical essays, stories, and occasional articles of all kinds. Among his

writings on Zionism are *Le-Maranan we-Rabanana* (1900) and *Tochen ha-Ziyonot* (1912). In all respects, Sokolow, who finally settled in London, is one of the greatest figures of modern Jewry.

**SOKO'TO.** Formerly one of the largest states of Central Sudan, extending with its dependencies eastward from the Lower Niger, above the confluence with the Benue, to the former Kingdom of Bornu and the borders of French Congo, and embracing a large part of the north-west of the present British colony of Nigeria to which it gives the name of a province (see NIGERIA) (Map: Africa, E 3). Area, estimated at over 100,000 square miles. Its population was composed principally of Hausas (see HAUSA STATES), but includes also the Fulbe (the ruling class) as well as Tuaregs, Arabs, etc. The total population is believed to have numbered 10,000,000. The Sokoto Empire took its rise in the nineteenth century. It originally formed a part of the great Fulah Empire established by Othman in Central Sudan at the beginning of the same century. It remained in the possession of the family of Othman until the commercial treaty with the Royal Niger Company in 1885, since when the territory has gradually come within the British sphere of influence, with the exception of Adamawa (q.v.), partly within the German sphere. In 1902 the rights of the Niger Company were transferred to the British crown and Sokoto rebelled but submitted in 1903. The city of Sokoto, formerly the capital with about 100,000 people, is now an insignificant place, and the capital has been transferred to Wurnu, a small town about 25 miles northeast. The commercial centre is Kano (q.v.).

**SOKOTRA, sô'kô'trà or sôk'ô-trâ.** An island in the Indian Ocean. See SOCOTRA.

**SOLANACEÆ** (from Lat. *solanum*, nightshade), or THE NIGHTSHADE FAMILY. A dicotyledonous family of herbs, shrubs, or tropical trees, including about 75 genera and 1750 species, widely distributed, but most abundant in the tropics. It contains some notable cultivated species, such as potato, tomato, egg plant, tobacco, and petunia. The conspicuous genera are *Solanum* (nightshade, bittersweet, horse nettle), *Physalis* (ground cherry), and *Datura* (jimson weed).

**SOL'AN GOOSE.** See GANNET.

**SOLANINE, sô'lâ-nîn or -nên.** See ALKALOIDS.

**SOLANO, sô-lâ'nô.** See SIMOOM.

**SOLA'NUM** (Lat., nightshade). A genus of widely distributed spiny, downy, or smooth herbs or shrubs of the family Solanaceæ, containing several hundred species, particularly abundant in tropical South America and the West Indies. By far the most important of all the species is *Solanum tuberosum*, the potato (q.v.), in which solanine is found in considerable quantity. Other species, *Solanum commersoni* and *Solanum maglia*, have recently come into notice on account of their tubers, some of which appear to be of value. Of the species with edible fruit, the principal is *Solanum melongena*, the eggplant. *Solanum dulcamara*, the bittersweet, and *Solanum nigrum*, the common nightshade, are both common in the United States, having been introduced from Europe. The berries of *Solanum saponaceum* are used as a substitute for soap, and in Australia those of several species are eaten by the natives, some

with and others without cooking. In the United States there are a dozen or more indigenous species, some of which, as *Solanum carolinense*, the horse nettle, and *Solanum rostratum*, the buffalo bur, are very spiny troublesome weeds.

HORSE NETTLE (*Solanum carolinense*).

For black nightshade see illustration in article NIGHTSHADE. See Colored Plate of POISONOUS PLANTS.

**SOLAR APEX.** See APEX OF THE SUN'S WAY; STAR.

**SOLAR CONSTANT.** The amount of heat which a square centimeter of the earth's surface exposed perpendicularly to the sun's rays would receive per minute if there were no atmospheric absorption. The amount of radiant energy actually reaching the surface of the earth is measured by means of a pyrheliometer (q.v.). If the experiment is repeated at different altitudes, the amount absorbed by the atmosphere can be estimated, and the solar constant can then be deduced. Although the younger Herschel and Pouillet had both determined the constant as early as 1838, still it was not until Langley (q.v.) invented his bolometer (q.v.) that it became possible to obtain measurements of the utmost precision. From simultaneous observations of the radiation received at the summit of Mount Whitney, California, nearly 15,000 feet above sea level, and at its base, Langley was able to determine that the absorption differed in different parts of the spectrum, being greatest in the ultra-violet and least in the infra-red, and that about 40 per cent of the solar radiation striking the clear atmosphere at its upper confines was absorbed before it reached sea level. This was far in excess of all previous estimates of the amount of atmospheric absorption, and Pouillet's value of 1.7 calories for the solar constant was at once almost doubled. In the most recent determination of the solar constant, made by C. G. Abbot (q.v.), nearly 700 measurements, extending over the period 1902-1913, were taken at such widely separated localities as Washington (sea level), Bassour in Algeria (3800 feet), Mount Wilson, Cal. (5670 feet), and Mount Whitney (14,500 feet), and a mean value of 1.93 standard 15° calories per square centimeter per minute was derived. In other words, the amount of heat

reaching the outside of our atmosphere from the sun is capable of doing continually the work of a 2 horse-power engine for each square yard of the earth's surface. Abbot found that the constant is subject to a long-period variation corresponding to the sunspot period, and a more irregular fluctuation of about 10 per cent, with a period of about a week or ten days, was detected, attributed to changes in the sun's emissivity.

**SOLAR CYCLE.** See PERIOD.

**SOLARI, sô-lä-ré (SOLARIO), ANDREA** (c.1460-1515). A Lombard Milanese painter of the High Renaissance. He is frequently called Andrea del Gobbo, after his elder brother Cristoforo, the sculptor, who seems to have brought him up and whose artistic influence may be seen in Andrea's delicate modeling of the heads. In 1490 they went to Venice, where Andrea executed many paintings in the manner of Bellini. On his return to Milan he fell completely under the influence of Leonardo da Vinci, and his standing was such that in 1507, when Cardinal George d'Amboise summoned Leonardo to France, Andrea was sent in his stead. He finished his decorations of the Cardinal's chapel at Gaillon in 1509, after which he seems to have gone to Flanders. The latter part of his life was passed probably at Milan. In color, chiaroscuro, and subtle modeling of heads, Solari approached nearer Leonardo than any other of his disciples. His portraits display a characterization and strength suggesting Holbein; the execution is delicate. His principal paintings include: "Holy Family with St. Jerome" (1495); the powerful portraits of a Venetian senator and of Longoni (1503), in the National Gallery (London); a "Madonna," "John the Baptist," and "Saint Catharine" (1499), in the Brera (Milan); a "Crucifixion" (1503), a "Male Portrait," and the "Madonna of the Green Cushion," in the Louvre; a "Rest on the Flight" (1515) and "Ecce Homo," in the Poldi collection, Milan, especially rich in his works; and the altarpiece of the Certosa at Pavia.

**SOLARI (SOLARIO), CRISTOFORO** (called IL GOBBO, the hunchback) (c.1450-1523). A Lombard sculptor and architect of the Renaissance. He worked with his brother Andrea at Venice and in 1495 he was appointed ducal sculptor to Ludovico Sforza at Milan. In 1498 he executed his masterpiece, the tomb of the Duke's wife, Beatrice d'Este, in Santa Maria delle Grazie. The monument was destroyed after the fall of the Duke, but the recumbent figures of himself and wife were taken to the Certosa of Pavia. They are naïve and realistic, thoroughly in the style of the early Renaissance. For the Certosa, Cristoforo also executed a number of decorations. During a sojourn in Rome he came under the influence of Michelangelo, which caused serious detriment to his originality as evidenced by his statues of "Christ" and "Adam," Milan Cathedral. His chief architectural work is the cupola of Santa Maria della Passione, Milan (1509).

**SOLAR MICROSCOPE** (Lat. *solaris*, relating to the sun). An instrument for projecting magnified images of minute objects on a screen, through the agency of the sun's rays or artificial illumination, the latter being more convenient and usual with modern instruments. The microscope consists of a brass tube fastened to the interior side of a closed window shutter over

a hole in the latter, and a reflector so placed that rays of sunlight falling on it are reflected into the tube. These rays, or those from an artificial illuminant, are then collected by a powerful double convex lens, and brought to a focus on the object, which is placed on a stage at the opposite end of a tube. An enlarged image of the object thus illuminated is then produced by a second lens or system of lenses upon a white screen. Should the object be opaque, the rays of light reflected from the mirror are concentrated by the double convex lens on another mirror near the opposite end of the tube; they are then reflected upon the back of the object, and diverge on the system of lenses which form the image. Instead of the sun's rays, the oxyhydrogen limelight and the electric arc are employed, the rays being thrown on the double convex condenser by means of a reflector. See PROJECTION APPARATUS; MICROSCOPE.

**SOLAR PARALLAX.** See PARALLAX.

**SOLAR SYSTEM.** The planets and comets pursuing orbital revolutions round the sun combine with it to form a system to which is given the name of solar system. It is not impossible that many stars are the centres of somewhat analogous systems. This, however, is merely a matter of speculation. No change of much magnitude can take place in the elements of the planets' orbits without having effect on the earth and its inhabitants, on account of the mutual attractions of the planets for each other; in fact, they appear as members of one isolated family, bound together by common ties, which could not be ruptured in the case of one individual without communicating a general shock to the others. See ASTRONOMY; PLANETS (and each planet under its own name), PLANETOIDS; COMET; SUN; MOON; SATELLITES; METEORS. Their motions are treated of under GRAVITATION; CENTRAL FORCES; PRECESSION; ORBIT; PERTURBATIONS; and their probable origin under COSMOGONY; NEBULÆ; so that it only remains here to give the more interesting numerical facts connected with them:

PLANET	Diameter (miles)	Density (earth's 1)	Mass (earth's 1)	Mean distance from sun (millions of miles)	Period of revolution (days)
Mercury .....	2,770	0.56	0.024	35.7	88
Venus .....	7,700	0.82	0.82	67.2	225
Earth .....	7,918	1.00	1	92.9	365
Planetoid Eros .....	20	?	?	135.1	643
Mars .....	4,230	0.71	0.105	141.5	687
Planetoid Ceres .....	480	?	?	257.1	1,381
Jupiter .....	86,500	0.24	318	483.3	4,333
Saturn .....	73,000	0.13	93	886.0	10,759
Uranus .....	31,900	0.22	15	1,781.9	30,688
Neptune .....	34,800	0.20	17	2,791.6	60,181

**SOLDÁN MARIANO FELIPE PAZ.** See PAZ SOLDÁN, M. F.

**SOLDER**, sŏl'dər or esp. Brit. pron. sŏl'dər (Lat. *solidare*, to make firm). Any fusible alloy that may be used for joining metals. Solders vary widely in composition according to the metals which it is desired to unite, but may be roughly divided into hard or brazing solders and soft or tinners' solders. Soft solders consist of varying proportions of tin and lead with or without the addition of bismuth. For electrical work soft solder receives a small addition of bismuth thus lowering the melting point of the mixture slightly below the boiling point of water. Soft

solder is applied either by melting and pouring upon the joint (wiping), by the blowpipe, or more frequently by heating the metal surface and the solder with a copper bolt attached to an iron handle known erroneously as a "soldering iron." For use the copper bolt must be clean, coated with solder, and somewhat hotter than the melting point of the solder. The fluxes used consist of alkaline or acid reacting compounds capable of dissolving any oxides formed during the operation. Those in common use consist of muriatic or hydrochloric acid, sal-ammoniac, borax, zinc chloride, etc. Common rosin, tallow, beeswax and similar substances protect the cleaned surfaces and are safest to use. Of late years a number of ingenious combinations of solder and flux have come into use, such as tubular solder filled with flux or the many dry granular and paste mixtures.

Cold solder, for articles which cannot be heated, consists of sodium amalgam, usually applied in the form of small pellets which have been previously warmed until the mercury starts to exude. The pellets are firmly pressed into the joint and the parts held rigidly for several hours. Hard solders or spelters are mixtures of copper, zinc, silver, tin, gold, etc., and are roughly classed as hard, white, and jewelers' solders. On account of their high melting point (red heat) they are applied with the blowpipe, torch, or forge fire. Borax is used as a flux in most cases.

Brass solder usually consists of equal parts of copper and zinc; for copper brazing the copper ingredient is increased to three parts. Jewelers' solders consist of silver or gold and copper with zinc. No really satisfactory aluminium solders exist; those in use consist of varying proportions of aluminium and zinc with various other metals; even common soft solder may be used. One compound containing phosphor tin requires no flux.

Autogenous soldering consists in joining two metallic surfaces with a strip of the same metal heated by the oxyhydrogen or oxyacetylene blowpipe. The familiar "lead burning" in chemical works is an example of this class. See ALLOY; BRAZING.

**SOLDIER BEETLE.** A name in the United States for any beetle of the tribe Telephoridi of the family Malacodermidæ. The name is derived from the trim appearance and color markings, suggesting an army uniform. The larvæ are predatory and feed upon soft-bodied insects—plant lice and small caterpillars. The Pennsylvania soldier beetle (*Chauliognathus pennsylvanicus*) is a common species in the eastern United States and is considered beneficial.

**SOLDIER BUG.** A name given to certain predatory stink bugs (q.v.) of the family Pentatomidæ, especially such forms as *Podisus spinosus*, *Stiretrus anchorago*, *Nezara hiliaris*, and *Euschistus servus*, which are common enemies of caterpillars.

**SOLDIER FLY.** Any one of the broad, flat-bodied flies of the family Stratiomyidæ, called "soldier flies" on account of the brightly colored stripes with which some species are marked. As a rule they are dark-colored and smooth. About 1000 species are known, and 200 of these are found in North America.

**SOLDIERS' HOMES.** There are two general classes of soldiers' homes in the United States: first, those administered and maintained by the Federal government; second, those administered

and partly maintained by State governments in certain States. The former include the United States Soldiers' Home, District of Columbia, and the National Home for Disabled Volunteer Soldiers, which is subdivided into 10 branches, located in different sections of the United States. Both the Northern and Southern States maintain homes. The latter are known as Confederate States Soldiers' Homes, and receive no appropriation, and are not under the jurisdiction of the Federal government. The State Soldiers' Homes of the Northern States, 32 in number, are exclusively under the control of the State authorities and operate under their special regulations, but receive certain financial aid from the Federal Treasury (Act of Congress approved Aug. 27, 1888), and are inspected once yearly under the supervision of the Board of Managers of the National Home for Disabled Volunteers. State Soldiers' Homes are located as follows: California, Veterans' Home, Napa County; Colorado, Monte Vista; Connecticut, Noroton Heights; Idaho, Boise; Illinois, Quincy; Indiana, La Fayette; Iowa, Marshalltown; Kansas, Fort Dodge; Massachusetts, Chelsea; Michigan, Grand Rapids; Minnesota State Home, Minneapolis; Missouri, St. James; Montana, Columbia Falls; Nebraska, Grand Island and Milford; New Hampshire, Tilton; New Jersey, Kearney and Vineland; New York, Bath and Oxford; North Dakota, Lisbon; Ohio, Sandusky and Madison; Oregon, Roseburg; Pennsylvania, Erie; Rhode Island, Bristol; South Dakota, Hot Springs; Vermont, Bennington; Washington, Orting and Port Orchard; Wisconsin, Waupaca; Wyoming, Buffalo. At certain of these State Soldiers' Homes, women who are the wives, widows, mothers, sisters, or daughters of ex-Union soldiers, sailors, and marines, and army female nurses are maintained, amounting in number to about 3000 women. The total amount of Federal aid to State institutions, estimated for the fiscal year 1915, was \$1,150,000. The total

moneys of deceased soldiers. The rules of admission are as follows: "The following persons, members of the Soldiers' Home, according to section 4814 Revised Statutes, shall be entitled to the rights and benefits herein conferred and no others. First, every soldier of the army of the United States, who has served, or may serve, honestly and faithfully 20 years in the same. Second, every soldier and every discharged soldier, whether regular or volunteer, who has suffered or may suffer, by reason of disease or wounds incurred in the service and in the line of his duty, rendering him incapable of further military service, if such disability was not occasioned by his own misconduct. Third, the invalid and disabled soldier, whether regular or volunteer, of the War of 1812 and subsequent wars (Revised Statutes, 4821)." Discharged soldiers who served only in volunteer organizations are not received at the Soldiers' Home in the District of Columbia, because provision is made for them in the National Home for Disabled Volunteer Soldiers.

**National Home for Disabled Volunteer Soldiers.** The government of this home has heretofore been vested by law in a board of managers composed of the President of the United States, the Secretary of War, the Chief Justice of the Supreme Court (all ex-officio), and eleven managers, who were elected by joint resolution of Congress, but an Act approved June 23, 1913, making appropriation for the fiscal year 1914, reduced that number of managers from eleven to five, as vacancies occur. These managers must all be residents of States which furnished organized bodies of soldiers to aid in suppressing the rebellion commenced in 1861, and no two of them shall be resident of the same State, and no person who gave aid or countenance to the rebellion shall ever be eligible. The home is composed of ten separate branches, a general depot, and the general offices which are located as follows:

BRANCH	Post-office address	Location
Central.....	National Military Home, Ohio	Dayton
Northwestern.....	National Home, Wisconsin	Milwaukee
Eastern.....	National Home, Togus, Maine	Togus
Southern.....	National Soldiers' Home, Virginia	Hampton
Western.....	National Military Home, Kansas	Leavenworth
Pacific.....	Soldiers' Home, California	Los Angeles
Marion.....	National Military Home, Indiana	Marion
Danville.....	National Home, Illinois	Danville
Mountain.....	National Soldiers' Home, Tennessee	Johnson City
Battle Mountain.....	Hot Springs, South Dakota	Hot Springs

number of persons maintained varied between 11,000 and 12,000.

**United States Soldiers' Home, District of Columbia.** This is a Federal institution, the administration of which, in accordance with regulations prescribed by Congress, is supervised by a Board of Commissioners, consisting of the Governor of the Home and the following Bureau chiefs of the War Department: the quartermaster general, the surgeon general, the judge advocate general, the adjutant general, and the chief of engineers. The number of persons cared for at this institution varies, from year to year, between 1000 and 1500. The total disbursements per year, including pensions of inmates, is about \$800,000. The sources of the funds are primarily stoppages or fines adjudged against soldiers by sentence of court-martial, forfeitures for desertion, and unclaimed

Eligibility for admittance: "The following persons only shall be entitled to the benefit of the National Home for Disabled Volunteer Soldiers, and may be admitted thereto upon the order of a member of the board of managers, namely: all honorably discharged officers, soldiers, and sailors who served in the regular or volunteer forces of the United States in any war in which the country has been engaged, including the Spanish-American War, the provisional army (authorized by Act of Congress approved March 2, 1899), in any of the campaigns against hostile Indians, or have served in the Philippines, in China, or in Alaska, who are disabled by disease, wounds or otherwise, and who have no adequate means of support, are not otherwise provided for by law, and by reason of such disability are incapable of earning their living." The average of officers and members pres-

ent during the year ending June 30, 1913, was 17,457. The yearly number cared for is gradually decreasing. The number cared for according to wars in which they participated, on June 30, 1913, was as follows: Mexican, 58; Civil War, 27,664; Spanish-American War, 2880; Provincial Army, 649; Indian Campaigns, 238; foreign service, 58. Whole number cared for since the organization of the home, to June 30, 1913, was 188,129.

**SOLE** (Lat. *solea*, sole). A flatfish (q.v.) of the family Soleidae. The common sole of Europe (*Solea vulgaris*) attains a length of from 10 to 20 inches and is highly esteemed for food. The American sole (*Achirus fasciatus*), or "hog-choker," is only about six inches long and is of less value. See Plate of FLATFISH AND FLOUNDER.

**SOLEILLET**, só'lá'yá', PAUL (1842-86). A French explorer, born at Nîmes. In 1873-74 he attempted to find a route for a commercial road between Algeria and the Niger. He failed in this, but his explorations convinced him of the practicability of a trans-Saharan railroad. He went to Senegambia in 1878 in the interests of this project, but his operations were frustrated by the Governor. In 1881 he went to Kaffa by way of Shoa and laid the way for French approach to the southern borders of Abyssinia. Then he was intrusted with founding the French colony of Obok on the Gulf of Aden. He died while on a new expedition to Shoa. His most important publications are: *Exploration du Sahara central* (1874); *Voyage à Ségou* (1878-79); *Voyages en Ethiopie* (1885); and *Une exploration en Ethiopie* (1886).

**SOLENN LEAGUE AND COVENANT.** See COVENANTS, THE.

**SOLENHOFEN** (zō'lén-hō'fén) **LITHOGRAPHIC STONE.** A deposit of limestone of Upper Jurassic age, which, on account of its fine-grained and smooth texture, is adapted for lithographic purposes. The most important quarries occur at Solenhofen, near Pappenheim, in Bavaria. The beds of good stone aggregate about 50 feet in thickness and are found in the lower portions of the quarries, many of which are 100 feet deep. Most of the lithographic stone used is obtained from this district. See ARCHEOPTERYX.

**SOLE/NODON** (from Gk. σωλήν, *sōlén*, channel, pipe + ὀδός, *odous*, tooth). A rare West Indian insectivore, of which there seem to be two species, inhabiting Cuba and St. Domingo, named respectively *Solenodon cubanus* and *S. paradoxus*. It is like a giant shrew, with a long, slender, conical snout, powerful, naked feet, and long claws fitted for digging, and a long, bare, opossum-like tail. Little is known of the solenodon's life history; it lives only a short time in captivity. It roots in the ground and tears apart rotten logs for grubs and other insects. It is nocturnal and spends the day in a hollow log or a hole. In St. Domingo the animal has been almost exterminated by the mongoose. For the most complete monograph of *Solenodon paradoxus*, consult G. M. Allen, in Museum of Comparative Zoölogy, *Bulletin*, vol. 40 (Cambridge, Mass., 1910). See Plate of CAVIES accompanying article CAVY.

**SOLENOID**, só'lé-noid or sô-lé'noid (from Gk. σωληνοειδής, *sōlēnoeidēs*, pipe-shaped). A cylindrical coil of wire used for producing magnetic effects by electric currents. The coil when

traversed by a current possesses all the qualities of a magnet. See MAGNETISM.

**SOLENT.** The west portion of the strait which with Spithead separates the Isle of Wight from England (Map: England, E 6). It is 17 miles long by 2 to 5 miles wide, is a favorite yachting ground, and affords safe anchorage. Hurst Castle guards its entrance on the southwest.

**SOLER**, or **SOLLAR** (AS. *solor*, *soler*, OF. *solier*, both from Lat. *solarium*, from *sol*, sun). An upper chamber. The only private apartment in the old baronial halls was so called. It was placed over the pantry, at one end of the hall, and served as parlor and sleeping apartment for the baron and his family.

**SOLEURE**, só'lēr'. The French name of Solothurn (q.v.).

**SOLEY**, só'li, JAMES RUSSELL (1850-1911). An American writer on naval subjects. He was born at Roxbury, Mass., graduated at Harvard in 1870, and was admitted to the bar in Washington, D. C. From 1872 to 1882 he was professor of history and law at the Naval Academy at Annapolis. From 1876 to 1890 he was professor in the United States navy. In 1882 he was transferred to Washington to arrange the Naval Library, and until 1890 was engaged in preparing the naval records of the Civil War. In 1890-93 he was Assistant Secretary of the Navy. He afterward practiced law in New York, and was counsel for Venezuela at the Paris arbitration of the Venezuela-British Guiana boundary in 1899. His publications include: *Historical Sketch of the United States Naval Academy* (1876); *Foreign Systems of Naval Education* (1880); *The Blockade and the Cruisers*, in the "Campaigns of the Civil War Series" (1883); with Commodore Schley, *Rescue of Greely* (1885); *Boys of 1812* (1887); *Admiral Porter* (1903), in the "Great Commanders Series." He also edited *Autobiography of Commodore Morris* (1880), and contributed to *The Battles and Leaders of the Civil War* (1887) and to Justin Winsor's *Narrative and Critical History of America*.

**SOLFATARA**, sól'fà-tà'rà (It. *solfatara*, from *solfo*, sulphur). A dormant volcano near Naples. The word is used as a common name for a volcanic vent emitting only vapors. Volcanoes after activity frequently send off gaseous eruptions, when steam, sulphureted hydrogen, carbon dioxide, and hydrochloric acid come forth, usually without explosive effects. Sulphur and chlorides are sometimes deposited by sublimation. Solfataras are quite numerous in the old volcanic regions of Italy. The Soufrière of Saint Vincent is a notable example of a solfatara at times violently eruptive.

**SOLFEGGIO**, sól-féd'jô. A vocal exercise the object of which is the training of the ear to acquire certainty in singing any intervals at sight without the aid of an instrument. The tones are sung either on one vowel (a) or on the syllables of solmization (q.v.).

**SOLFERINO**, sól'fe-rē'nô. A village in the Province of Mantua, Italy, 20 miles northwest of Mantua (Map: Italy, C 2). It is famous as the scene of a bloody battle on June 24, 1859, in which the allied French and Sardinians, under Napoleon III, defeated the Austrians. The Tower of San Martino, commanding a splendid view and containing a military museum, commemorates this victory, which was decisive in securing Italian independence.

**SOLI**, ARATUS OF. See ARATUS OF SOLI.

**SOLICITOR.** Under the laws of Great Britain, a person duly admitted to practice law under the provisions of the Solicitor's Acts, and who thereby becomes an officer of the Supreme Court and entitled to certain privileges and immunities. Before the Judicature Act (1873) the term was applied only to persons who conducted litigation in the Court of Chancery, but by the above act all solicitors, attorneys, and proctors authorized to practice in any division of the High Court of Justice are known as solicitors of the Supreme Court. The Incorporated Law Society was appointed "Registrar of Solicitors" in 1843, and in 1877 that society was given control of the examination of candidates for admission as solicitors. Each solicitor must obtain annually a certificate of his right to practice from the Registrar of Solicitors. A solicitor can practice in the High Court of Justice, the Court of Appeal, the House of Lords, Privy Council, and all inferior courts. They have a monopoly on certain legal business, as, e.g., the attestation of documents required by the Land Transfer Act. As a solicitor is an officer of the court the latter can exercise summary jurisdiction over him in case of a breach of duty. A solicitor who permits another to practice in his name will be disbarred and can never be readmitted. Where a solicitor is struck off the rolls for other misconduct, he may be subsequently readmitted in the discretion of the court. In the United States the distinction between solicitors and barristers has not been generally recognized. Consult A. Cordery, *Law Relating to Solicitors* (London, 1887-88).

**SOLICITOR-GENERAL.** One of the important law officers of the English crown, appointed by letters patent. He is always a member of the House of Commons, and is *ex officio* a Minister of the crown and a member of the General Council of the bar. He is not, however, a member of the cabinet. He is next in rank to the Attorney-General and represents him in his absence. His term of office expires with the fall of the ministry of which he is a member. The Solicitor-General of Scotland is next in rank to the Lord Advocate.

In the United States the Solicitor-General is a Federal officer appointed by the President to assist the Attorney-General, and to take the latter's place in case of absence or illness.

**SOLID ALCOHOL.** See WOOD DISTILLATION.

**SOLID SOLUTION.** See ISOMORPHISM; SOLUTION.

**SOLINGEN**, zō'ling-en. A town in the Rhine Province, Prussia, 18 miles north-northeast of Cologne (Map: Germany, B 3). It has long been famous for its steel and iron ware manufactures, especially sword blades, helmets, cuirasses, knives, scissors, and hand bells. Pop., including the town of Dorp, 1900, 45,249; 1910, 50,536.

**SOLIPSISM** (from Lat. *solus*, alone, only + *ipse*, self). A term applied, usually by opponents, to any system of philosophy the principles of which do not logically warrant the belief in any other being than the mind of the thinker. It is a subjective idealism (q.v.) which is so subjective as to leave no valid ground for belief in objectivity. As a matter of fact actual solipsists have been rare although perhaps many subjective idealists if they had been consistent would have been solipsists.

**SOLÍS**, sô-lēs', JUAN DÍAZ DE (c.1470-1516). A Spanish navigator. He is said, although with-

out good authority, to have discovered Yucatan with Vicente Yáñez Pinzón in 1506. After the death of Vespucci in 1512 he was appointed pilot-major of Spain. He discovered the entrance to the Río de la Plata and explored the river as far as the region of the Charrúa tribe, by whom he was killed before September, 1516. His brother-in-law, Francisco de Torres, conducted the survivors of the expedition back to Spain.

**SOLÍS Y RIVADENEYRA**, sô-lēs' é rê-vá-dā-nē'é-rá, ANTONIO DE (1610-86). A Spanish dramatist, historian, and statesman. He was born, probably, at Alcalá de Henares, studied at Salamanca where he produced (1627) a play, *Amor y Obligación*, and became Secretary of State (1654), private secretary to Philip IV, and chronicler of the Indies. In 1667 he took orders, whereupon he ceased writing for the stage. Of his 10 extant plays two are important in a comparative study of the drama: *El Amor al uso* and *La Gitanilla de Madrid*. His *Historia de la Conquista de Méjico*, which appeared in 1684 and was translated by Townshend (1724), is a Spanish prose classic. Consult D. E. Martell, *Dramas of D. Antonio de Solís y Rivadeneira* (Philadelphia, 1903).

**SOLITAIRE**, sôl'i-târ' (Fr., solitary). An extinct dodo-like bird (*Pezophaps solitarius*), differing from the dodos in a smaller bill and longer legs. It inhabited Rodriguez, and appears to have been peculiar to that island. François Leguat, in his *Voyages et aventures* (London, 1708), has left an interesting account of the solitaire. He describes it as a large bird, the male weighing about 45 pounds, its head without comb or crest, that of the female with a small widow's peak above the bill; the wings small, incapable of flight, but used for offense and defense, or to wave signals. The plumage was full and beautiful, but the tail was a roundish mass of feathers. It became extinct about 1775, but many skeletons are preserved in European museums. Consult Walter Rothschild, *Extinct Birds* (London, 1907). See DODO; EXTINCT ANIMALS.

In America the name solitaire is given to the flycatching thrushes of the genus *Myadestes*, species of which occur in Jamaica, Martinique, and other West Indian islands, as well as on the continent. One species, *Myadestes townsendi*, dwells in the western United States from the Rocky Mountains to the Pacific. It is about 8 inches long, and dull brownish ash in color, and is a superb singer, as indeed are all the members of the genus. The name "solitaire" refers to its habit of hiding in solitary depths of the forests.

**SOLITAIRE.** A game played by only one person. Its origin is not known, but it is supposed to have been invented by a prisoner in the Bastille in the seventeenth century. It is played with 37 balls (usually of glass) on a circular board with 37 hemispherical cups or depressions. The game is played by removing

THE SOLITAIRE (after a drawing by Leguat).

one ball from the board and then placing an adjoining ball in the vacancy, passing over one intervening ball. The ball passed over is then taken up. This is then continued till only one ball remains, when the game is said to be won. Should two or more balls be left and they more than one space apart, and consequently isolated so as not to be liable to capture by each other, the game is lost.

**Solitaire with Cards, or Patience.** The pack or packs (sometimes with the exception of certain cards, which are laid face upward on the table) are shuffled. The player then takes the cards, backs uppermost, and plays them one by one, turning them face upward. His object is to arrange the cards in "families," each family being a complete series from ace to king, but not necessarily of the same suit. They may be formed by building upward, i.e., placing a higher card on the one next below it, or vice versa. The cards may be taken from the pack in the player's hand as already described, or they may be taken from an arrangement of card-piles on the table, or from either. If the player places any top card of these piles (should he elect to arrange the game that way) on any other just above or below it in rank, he is said to be making a marriage, by which he frees the cards underneath and utilizes them in "building." Cards not readily usable in building are laid aside and constitute "stock." Thus the stock may be used over again once or twice (first shuffling). There are several other varieties of card solitaire.

**SOLLAS, söl'as, WILLIAM JOHNSON** (1849-). An English geologist. He was born at Birmingham and was educated at the Royal School of Mines and at St. John's College, Cambridge. He was Cambridge University extension lecturer (1873-78); professor of geology and zoölogy at University College, Bristol (1880-83); of geology and mineralogy at Dublin University (1883-97); and in 1897 was appointed professor of geology and paleontology at Oxford. In 1896 the Royal Society gave him charge of an expedition to investigate Funafuti, a coral island in the Pacific. He was elected president of the Geological Society, London. He made numerous contributions to scientific societies and journals on geological, mineralogical, zoölogical, and ethnographic subjects, wrote *Tetractinellida*, the 24th volume of the reports of the *Challenger* expedition; also *The Age of the Earth* (1905); *Ancient Hunters* (1911).

**SOLLOGUB, söl'o-gööp', VLADIMIR ALEXANDROVITCH, COUNT** (1814-82). A Russian author, born at St. Petersburg. He graduated at the University of Dorpat (1834) and held various diplomatic and official positions. He made his literary début in 1837 with the novelettes *Two Students* and *Three Fiancés*, but attracted general attention with his *History of a Pair of Rubbers* (1839), and still more so with his *Tarantulas* (1845). Of his numerous works for the stage, the farce *The Troublesomeness of a Tender Heart* (1850) and *The Official* (1856) are best known. His works of fiction appeared in five volumes (St. Petersburg, 1855-56). Though very popular in his day Sollogub is little read nowadays.

**SOLL UND HABEN, zöl unt hä'ben** (Ger., Debit and Credit). A noted romance by Gustav Freytag (1855), based on a study of modern industrial conditions.

**SOL'MIZA'TION** (from *sol* + *mi*, names of

two notes of the gamut). A peculiar method in use for centuries for teaching musical intervals and scales by means of certain syllables. The syllables are *ut* (or *do*), *re*, *mi*, *fa*, *sol*, *la*, and *si*. The first six are the commencement of the lines of an ancient hymn to John the Baptist, peculiar in that the first syllable of each line (with the exception of the last) was sung to a note one degree higher than the first syllable of the preceding line, thus presenting the type of a scale. See GUIDO D'AREZZO.

These syllables are said to have been first used by Guido of Arezzo in the eleventh century. As Guido employed a hexachord, six syllables were sufficient. But when the importance of the leading tone was recognized the heptachord superseded the old hexachord. Then Le Maire, a French musician of the seventeenth century, added to them *si*, for the seventh of the scale. When applied to the key of C, their equivalents, in the ordinary musical nomenclature are:

Do	re	mi	fa	sol	la	si	do
C	D	E	F	G	A	B	C

These syllables may, however, be applied to other keys, with *do* always as the key-note, so as to express, not the absolute pitch of a note, but its relation to the key-note. See SOLFEGGIO.

**SOLMONA, söl-mō'nā, or SULMONA, söl-mō'nā.** A city in the Province of Aquila, Italy. Solmona manufactures wine, paper, cloth, and strings for musical instruments. The city is famous as the birthplace of the poet Ovid. Pop. (town), 1911, 13,372.

**SOLMS-LAUBACH, zölms-lou'bäg, HERMANN, COUNT** (1842-1916). A German botanist, born near Giessen and educated there and at Berlin, Freiburg, and Geneva. He became professor extraordinary at Strassburg in 1872 and professor of botany and director of the Botanical Garden at Göttingen in 1879, and was called to a similar position at Strassburg in 1888. His publications include: "Ueber den Bau und die Entwicklung der Ernährungsorgane parasitischer Phanerogamen," in the *Jahrbücher für wissenschaftliche Botanik* (1867-68); *Corallina* (1881); *Herkunft, Domestikation und Verbreitung des gewöhnlichen Feigenbaums* (1882); *Die Geschlechterdifferenzierung bei den Feigenbäumen* (1885); *Einleitung in die Paläophytologie* (1887); *Die leitenden Gesichtspunkte einer allgemeinen Pflanzengeographie* (1905).

**SOLO** (It., alone). In music, a piece or passage for a single voice or instrument. In orchestral compositions "solo" indicates that one instrument is to take the leading part.

**SOLOGUB, söl'o-gööp', FEDOR** (1863-). The pen name of a Russian writer, his real name being Feodor Kuzmitch Teternikov. He studied at the St. Petersburg Teachers Institute and later became a schoolmaster. His literary career dates from 1894, when his first story, "Shadows," appeared in the periodical *Severny Vestnik*. Afterward he wrote poetry, plays, novels, fables, essays, and short stories. His first literary success came in 1907, when his novel *The Little Demon* proved immensely popular. His complete works numbered 20 volumes in 1914. Sologub, like Anton Chekhov (q.v.), is a true literary descendant of Gogol, but he excels Chekhov in the power of creative imagination. As a stylist he is unsurpassed among writers of his day. His peculiar sphere in fiction is the life of the *szaul* provincial Russian towns. In English ap-

peared *The Sweet-Scented Name and Other Stories* (1915).

**SOL'OMON** (Heb. *Shēlomōh*, peaceable or prosperous). A son of David and Bathsheba (2 Sam. xii. 24), successor of David on the throne of Israel (c.993-953 B.C.). The biblical account of Solomon is found in 1 Kings i-xi, and its parallel 2 Chron. i-ix. When David was old his son Adonijah set himself up as a pretender to the throne, but Bathsheba interceded for Solomon. David granted her request and Solomon became King. One by one the new King had his enemies, Adonijah, Joab, and Shimei, put to death, so that he rested securely on his throne. A daughter of Pharaoh was among his wives. Solomon divided Israel into twelve parts for administrative purposes, and we are told that his territory extended from the river (Euphrates) unto the land of the Philistines, and unto the border of Egypt, and that he made bondsmen of the Canaanites who remained in the land. He made an alliance with Hiram, King of Tyre, who, in return for food, furnished him with timber; the ships of the allies went out trading together. The Yahwe temple was built in great splendor with Hiram's aid and dedicated with much magnificence. The temple took from the fourth to the eleventh year of Solomon's reign for its completion; the palace in the Lebanon from the seventh to the twentieth year. He also built sanctuaries to Chemosh, the Moabitish god. Many foreign women were in his household, who are said to have influenced him to worship alien gods. Almost all other details about Solomon are amplifications either of his wisdom or his splendor. We are told that God appeared to him in a dream and asked him to choose a gift, whereupon Solomon chose neither riches nor power, but wisdom, and as a reward was given both what he chose and what he resigned. A proof of his wisdom immediately follows (1 Kings iii. 16-25), and it is never lost sight of afterwards (cf. 1 Kings iv. 29 et seq., where he is said to be "wiser than all men"; v. 7-12; x. 1-3, where Solomon answers the "hard questions" propounded by the Queen of Sheba, and x. 24). The entire narrative is a recital of the magnificence of the King, especially the description of his building operations (1 Kings iv. 22-28, ix. 26-29, x. 1-13; 2 Chron. ix. 9). On the visit of the Queen of Sheba, see **SABAEANS**; **SHEBA**.

The narrative in Kings concerning Solomon is based upon earlier documents, such as the "Book of the Acts of Solomon" (1 Kings xi. 41). The main facts are unquestionably authentic, though the account has to some extent been colored by a view of Solomon belonging to a period many centuries later. This view is still more consistently carried out in the narrative in Chronicles, which has no independent historical value. In the Book of Kings there are still traces of a conception of Solomon which did not hold him up in a favorable light. The extension of power is made responsible for the introduction of foreign religious customs, and the blame for the rebellion immediately following upon the death of Solomon is in part, at least, put upon the King. In Chronicles, however, all these unfavorable features are suppressed and the King is held up as a marvel of piety and wisdom, as well as a great ruler under whom the Kingdom rose to its highest point of glory.

Solomon's distinguishing quality was as an

administrator. He kept the Kingdom intact during his reign, though not in such a condition that his successor could continue his policy. An important step was his strengthening the fortifications of the country, and no less significant was his foreign policy, which involved alliances with surrounding nations such as the Phenicians. Through this international intercourse an impetus was given to commerce in Solomon's days. (See **ELATH**; **EZION GEBER**; **OPHIR**.) Contact with other nations also had its result in a marked intellectual advance, and it is probably safe to assume that already in Solomon's days there was a genuine literary activity in Israel. The new epoch thus marked by Solomon's reign is sufficient to account for the view taken by the later tradition, which makes Solomon himself an author of high rank and prodigious fertility. The books ascribed to him, Proverbs, Canticles, Ecclesiastes, Wisdom of Solomon, Psalms of Solomon, and Odes of Solomon (qq.v.), belong to various periods which, however, are all many centuries later than his time. That the simpler sanctuary of former days was replaced in his reign by a more ambitious edifice was a natural consequence of a general political growth, but the description of the new edifice is colored by the desire to extol the grandeur of Solomon's achievements, while the account of the ceremonies, including the prayer, is probably a post-exilic production. Consult the chapters on Solomon in the Hebrew histories of Guthe, Stade, Kent, Wellhausen, Piepenbring, Kittel, and Cornill; also W. S. Caldecott, *Solomon's Temple: Its History and Structure* (Philadelphia, 1907).

**SOLOMON, ODES OF.** A collection of 42 odes ascribed to Solomon. Five of these are quoted in the Gnostic work, *Pistis Sophia*. The Odes are referred to in the *Pseudo Athanasian Synopsis* (sixth century), and in the *Stichometry* of Nicephorus (ninth century); Lactantius quotes one of them, and a sixteenth-century Syriac manuscript discovered and published by J. Rendel Harris in 1909 contains 40 of the hymns. They were first supposed by Harnack and some other scholars to be a Jewish work with extensive Christian interpolations, but the majority of investigators are now agreed that they are of Christian origin. They were probably written in Greek in northern Syria in the first half of the second century A.D., and seem to be to some extent affected by Gnosticism of the type found in the apocryphal Acts of the Apostles (see **ΑΠΟΚΡΥΦΑ**). Some scholars have attempted to prove that they were composed by Montanus, Valentinus, or Bardesanes, but the arguments are not convincing. Though the Syriac translation does not fully reveal the characteristics of the original form, there can be no question that the author was an exceptionally gifted poet as well as a mystic of deep religious experience and tenderness of feeling. The peculiarities of theological opinion and sentiment offer many difficulties to the interpreter, but the Odes are universally regarded as one of the most remarkable recent discoveries in the field of early Christian literature.

Rendel Harris, *The Odes and Psalms of Solomon* (Cambridge, 1909; 2d ed., ib., 1911); Fleming and Harnack, *Ein jüdisch-christliches Psalmbuch aus dem ersten Jahrhundert* (Leipzig, 1910); H. Gunkel, in *Zeitschrift für neutestamentliche Wissenschaft* (Giessen, 1910); F. C. Conybeare, *The Odes of*

*Solomon Montanist* (ib., 1911); S. A. Fries, *Die Oden Salomos* (ib., 1911); W. Stölten, *Gnostische Parallelen zu den Oden Salomos* (ib., 1912); W. Frankenberg, *Das Verständnis der Oden Salomos* (Giessen, 1912); W. R. Newbold, in *Journal of Biblical Literature* (Boston, 1912).

**SOLOMON, PSALMS OF.** A collection of 18 psalms ascribed to Solomon. They are found in eight Greek manuscripts, and are mentioned in the catalogue at the beginning of the *Codex Alexandrinus* and other early lists. A Syriac version, made from the Greek, was discovered by J. Rendel Harris and published in 1909, and some fragments of other manuscripts have come to light since then. The close from xvii, 38 b to the end of xviii is still missing. These Psalms were originally written in Hebrew, and unmistakable historic allusions show that they were composed after 63 and before 48 B.C. They reflect the attitude of the Pharisees to the Hasmonæan dynasty and the hope of a Messiah who shall be truly a descendant of David and a righteous King. The Greek text has been edited by E. H. Ryle and A. James (*Psalms of the Pharisees*, Cambridge, 1891) and O. von Gebhardt (*Die Psalmen Salomos*, Leipzig, 1895), and the Syriac text by J. Rendel Harris (*The Odes and Psalms of Solomon*, 2d ed., Cambridge, 1911). Consult J. Viteau, *Les Psaumes de Salomon* (Paris, 1911), and G. B. Gray, in R. H. Charles, *The Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913).

**SOLOMON, WISDOM OF.** One of the deuterocanonical books of the Old Testament, sometimes called also the Book of Wisdom. Solomon is introduced as the speaker (cf. chaps. vii-ix), whence the name first mentioned. The book consists of three parts: (1) chapters i-v commend wisdom to rulers and incidentally attack Greek philosophy, particularly the Epicurean school, and show how absorption in worldly affairs leads to spiritual ruin; (2) chapters vi-ix teach how wisdom, which is above all other benefits, may be gained, and Solomon relates how he came to choose wisdom as his life's companion; the section closes with Solomon's prayer for wisdom; (3) chapters x-xix illustrate the influence of wisdom on Israel's history, the miracles in the history are ascribed to wisdom, and, by way of contrast, the results of folly in the history of heathen nations are held up to scorn. The book seems to have been written originally in Greek about the middle of the first century B.C. An influence of Greek philosophy is admitted by most scholars. The unity of the book is not quite certain. Consult: K. Siegfried, in E. Kautzsch, *Die Apokryphen und Pseudepigraphen des Alten Testaments* (Tübingen, 1900); A. Harnisch, *Die griechische Philosophie im Buche der Weisheit* (Münster, 1908); F. C. Porter, "The Pre-Existence of the Soul in the Book of Wisdom," in *Semitic Studies* (Chicago, 1908); Samuel Holmes in R. H. Charles, *Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913). See APOCRYPHA.

**SOLOMON BEN GABIROL**, bēn gā'bē-rōl'. A Jewish philosopher and poet, best known as Avicbron (q.v.).

**SOLOMON ISLANDS.** A group of islands in the Pacific Ocean, extending in a direction from northwest to southeast between lat. 5° and 11° S., and long. 154° 40' and 162° 30' E. (Map: Australasia, J 3). It is about 120 miles distant from the Bismarck Archipelago on the west. Area about 17,000 square miles. The

principal islands are Bougainville, Choiseul, New Georgia, Ysabel, Malaita, Guadalcanar, and San Cristoval. They are mostly oblong in shape, mountainous, and lined with coastal coral reefs. Traces of volcanic origin are found in the shape of craters, hot springs, etc. There are some active volcanoes, and earthquakes are frequent. The flora is luxuriant; many islands have forests of ebony and sandalwood; the fauna is Papuan in character. The climate is hot, moist, and unhealthful. Copra, pearl shell, and sandalwood are exported.

The population, estimated at 200,000, are Melanesians, with the possibility that in the unexplored mountains of the larger islands there may exist a race of still more primitive autochthons. Their physical type is not uniform, the people of the islands on Bougainville Strait being taller, darker, more robust, and more brachycephalic, those of San Cristoval and the islands adjacent shorter, lighter, less vigorous, and more dolichocephalic. The languages show great variation, amounting sometimes to mutual unintelligibility. Traces of Polynesian influences occur in speech, institutions, etc. Head-hunting, slavery, cannibalism, and taboo (here tambu) are among the native institutions, now waning.

Germany owned Bougainville, Buka, and some smaller islands, up to the Great War which began in 1914, when they were captured by an Australian expeditionary force. (See WAR IN EUROPE.) The island of Choiseul, the island of Ysabel, and the various smaller islands to the east of Bougainville, with an area of 14,800 square miles and a population in 1914 of about 150,000, were transferred to Great Britain in 1899. The discovery of the Solomon Islands is attributed to the Spanish navigator Mendaña (1567). By an agreement in 1885 the group was divided between Great Britain and Germany and by that of 1899 in settlement of the partition of Samoa Great Britain acquired a large part of the German share in exchange for the island of Savaii. Consult: H. B. Guppy, *The Solomon Islands and Their Natives* (London, 1887); id., *The Solomon Islands, Their Geology, etc.* (ib., 1887); Elisée Reclus, in *Nouvelle géographie universelle*, vol. xiv (Paris, 1889); C. M. Woodford, *A Naturalist Among the Head Hunters* (London, 1890); Alvaro Mendaña de Neyra, *Discovery of the Solomon Islands*, translated and edited by Lord Amherst of Hackney and Basil Thomson for the Hakluyt Society (2 vols., ib., 1901).

**SOLOMON'S SEAL** (*Polygonatum*). A genus of plants of the family Liliaceæ, differing from

SOLOMON'S SEAL (*Polygonatum*).

A fruiting spray of Solomon's seal, with a terminal piece of a root-stem; s, showing the scars or "seals."

lily of the valley chiefly in the cylindrical tubular perianth, and in having the flowers joined to their flower-stalks. Of several European spe-

cies, the common Solomon's seal (*Polygonatum multiflorum*) has a stem about 2 feet high, the upper part of which bears two rows of large, ovate-elliptical, alternate leaves. The flower-stalks are generally branched; the small flowers white and drooping. The young shoots of *Polygonatum officinale* are eaten by the Turks like asparagus. The root is white, fleshy, inodorous, with a sweetish, mucilaginous, acrid taste. It has been made into bread in times of scarcity. Among the American species *Polygonatum commutatum*, the great Solomon's seal, and *Polygonatum biflorum*, smaller Solomon's seal, oc-

FALSE SOLOMON'S SEAL (*Smilacina racemosa*).

cur from the Atlantic coast to the Great Plains. The name is derived from the seal-like markings left upon the knotted rootstocks by the falling of the annual stems. Medicinal virtues were once attributed to the dried rootstocks. *Smilacina racemosa*, an allied plant, is called false Solomon's seal and false spikenard.

**SOLOMON'S SONG.** See CANTICLES.

**SOLOMOS**, sô'lô-môs, DIONYSIOS. See ROMANIC LITERATURE.

**SOLON** (Lat., from Gk. Σόλων) (c.639-559 B.C.). An Athenian lawgiver and patriot, son of Execestides, descended from the noble line of the Codrids. In his earlier years Solon engaged in trade and probably visited the eastern Aegean, where he learned much from progressive Ionia. He mastered Ionic literature, and wrote verse in the Ionic dialect—he was the first Athenian to win renown by his poetry. Solon's life fell in the time of great social and economic change in Greece. As a result of the growing importance of commerce, capital was becoming concentrated in a few hands, while the small farmers and agricultural laborers were weighed down with debt. The small proprietors were deprived of their lands; many free Athenians who could not pay what they owed were sold into slavery. The law favored the rich, and a revolution seemed imminent, when, in the year 594-593 (or 592-591), Solon was elected archon, probably by the more moderate of both parties, and received full power to reform the oppressive conditions. He began with two radical measures: he forbade the borrowing of money on the person of the debtor, and also annulled all mortgages and debts in which the person of the debtor had been pledged. Probably he reduced debts in general and lowered the rate of interest. This great reform was called the *Seisachtheia* (σεισάχθεια), or Shifting of Burdens, and was celebrated by a festival. He then restored by an amnesty all who had lost civil rights before his archonship, with the exception of those who had been punished for murder or attempted tyranny. His next remedial

measure was to forbid the export of all products with the exception of oil; he thereby secured a sufficient supply of grain for Athens at a moderate price. He also limited the amount of land which might be held by a single person. Of great importance was the substitution of a standard of coinage closely resembling the Euboean for the prevailing Aeginetan standard. Seventy of the new drachmæ equaled one hundred of the old. This secured to the poor great relief, and emancipated Athens from her rivals, Aegina and Megara, and gave her the advantage of trade with the colonies in Sicily and Italy. Solon abolished the laws of Draco (q.v.), except those which referred to murder. In place of the old four classes, which had been based on the amount of capital possessed, he divided the citizens into four classes on the basis of income. The political offices were open only to the members of the first three classes; the treasury and the archons were reserved for the first. The fourth class had simply the right to take part in the assembly ('Εκκλησία) and the public law courts. But the gaining of this privilege was a most important step in the direction of democracy, for before the popular courts every magistrate might be accused when he laid down his office, and in this way the people had control over the administration. For the selection of officials Solon introduced a peculiar combination of choice and lot. The Senate (Βουλή) was composed of 400 members, 100 from each tribe. (See BOULE.) This body and the popular assembly undoubtedly received many of the rights formerly possessed by the Areopagus (q.v.), which now retained jurisdiction only in murder cases, together with general censorial power over the laws. Tradition says that after his year of office Solon bound his fellow citizens by an oath to keep the laws and withdrew from Athens for a period of 10 years. Although many details are obscure and disputed, it is undoubted that Solon emancipated the individual and took the first decisive step towards complete democracy, despite the fact that after his year of office internal disorder broke out, and Solon lived to see a tyranny established at Athens by one of his own kinsmen. See PRISISTRATUS.

See ATHENS, History.

**SOLOTHURN**, zô'lô-tûrn (Fr. Soleure). A canton of Switzerland (Map: Switzerland, B 1). It is traversed lengthwise by the main ridge of the Jura, reaching a maximum height of 4754 feet. The northwestern part is covered by the minor Jura ridges and parallel mountain valleys, while along the southeastern boundary extends the valley of the Aar. The climate is somewhat severe. Almost the entire area is utilized for grain and stock raising, and the output of cereals is above the domestic demand. Fruit, dairy products, wood, marble, gypsum,

and building stone are exported. The chief manufactured article is matches. The constitution of the canton dates from 1875, and, as amended in 1895, provides for a legislative assembly elected for four years at the rate of one member for every 800 inhabitants. The five members of the Executive Council are also elected by the people for the same period. The canton returns six members to the National Council. Capital, Solothurn. Pop., 1910, 116,728, of whom Roman Catholics form over three-fourths. German is the predominating language. The history of the canton centres chiefly around its capital, Solothurn, which dates from pre-Roman times, and which in 1218 became a free Imperial city. The burghers were associated with Bern in the struggles against the petty princes of the region. Solothurn was formally admitted into the Swiss Confederation in 1481, by which time it had extended its rule over the region now constituting the canton. The aristocratic régime which had long existed in the canton ended in 1830.

**SOLOTHURN.** The capital of the Canton of Solothurn, Switzerland, on the Aar, about 20 miles north-northeast of Bern (Map: Switzerland, B 1). It is a walled city with broad streets and numerous churches. The cathedral of Saint-Ours (the cathedral church of the bishopric of Basel) is a cruciform structure of the eighteenth century, built on the site of an old church dating from 1050. Other interesting architectural structures are the ancient clock tower and the cloth hall with its collection of weapons. The town library contains about 40,000 volumes. There is a natural-history museum with valuable zoölogical and paleontological collections. The environs of the town are exceedingly picturesque and abound in villas and resorts. The chief industries are watchmaking and stone quarrying. Pop., 1900, 10,100; 1910, 10,465.

**SOLOVIOV**, só'lv-vyof', **SERGEI MIKHAIL-OVITCH** (1820-79). An eminent Russian historian, born and educated at Moscow. From 1842 to 1844 he was abroad as tutor in Count Stroganov's family, attending the lectures of Ranke, Böckh, and Michelet. His treatise on *The Relations between Novgorod and the Grand Princes* (1845) and his dissertation, *History of the Relations among the Russian Princes of the House of Rurik* (1847), established his reputation and brought him a professorship in history at Moscow University. Subsequently he was dean of the Historico-Philological Faculty and rector of the university. His *History of Russia* in 29 volumes (7th ed., 1879), the first thorough treatment of the subject from the earliest period to 1774, is a rich storehouse of historical material drawn upon by all subsequent writers to this day. He wrote also a number of historical textbooks, including *Historical Letters* (1858), *History of the Fall of Poland* (1863), and *Political and Diplomatic History of Alexander I* (1877). With Kostomarov (q.v.) and others, he adopted the organic view of history.

**SOLSTICE**, só'stis (Lat. *solstitium*, from *sol*, sun + *sistere*, to stand). That point in the ecliptic (q.v.) at which the sun attains its greatest north or south declination, and where it is consequently at the turning point of its apparent course. There are two such points in the ecliptic, one of which is the summer, and the other the winter, solstice to those who inhabit northern latitudes. The term is also employed to signify the dates at which the sun attains these two points, viz., June 21 and December 21.

**SOLUBLE GLASS.** See **WATER GLASS.**

**SOLUTION** (Lat. *solvere*, to dissolve). In chemistry, a term applicable to any mixture that can be formed by the interdiffusion of two or more substances, gaseous, liquid, or solid. A mixture so formed is invariably homogeneous, i.e., its ingredients do not exist alongside of one another in separate masses, and therefore cannot be distinguished separately even by means of a powerful microscope. For the distinction between a homogeneous mixture and a chemical compound, see the article **CHEMISTRY.**

**Gaseous Mixtures.** The formation of these is not limited to any particular set of substances, as is the case with liquids and solids; all gases are capable of mutual interpenetration by diffusion and hence of forming homogeneous mixtures. In a gaseous mixture (unless it be under extraordinarily great pressure) the properties of each ingredient are but slightly affected by the presence of the other ingredients.

**Liquid Solutions.** These may be formed by liquids with gases, by liquids with other liquids, and by liquids with solids.

The mass of any gas absorbed by any liquid is proportional to the pressure of the gas (Henry's law) and diminishes with increasing temperature. Of course, even under the same conditions of pressure and temperature the solubility of different gases in some liquid is not the same; thus carbonic acid gas is much more soluble in water than oxygen. The solubility in the case of each system consisting of a gas and a liquid is termed by Bunsen the "coefficient of absorption." To understand clearly the meaning of this term imagine some gas in contact with a given liquid and maintained at some temperature *t*, under a pressure equal to the normal pressure of the atmosphere; imagine that when no more of the gas is being absorbed, all the gas contained in one cubic centimeter of the solution is driven out of it, confined separately, and cooled off to 0° C. (32° F.); the volume that the gas will then occupy is its coefficient of absorption with respect to the given liquid at the temperature *t*. Gases that are very soluble fail to obey Henry's law, possibly because they enter, to a greater or less extent, into chemical combination with the solvent liquid; for the reliability of the law itself has been clearly demonstrated by theoretical considerations of indubitable reliability. (See **HENRY.**) However, it must be borne in mind that theoretically Henry's law can only be expected to hold true as long as the amount of gas absorbed by the solvent is very small.

Dilute solutions of gases in liquids obey the laws of osmotic pressure as well as do dilute solutions in general. See further below.

Passing to solution of liquids in liquids, we find, first, that some liquids (e.g., water and alcohol) are miscible in all proportions, that the mutual solubility of others (e.g., water and ether) is limited, and that still others are practically insoluble in each other. There are strong reasons for assuming that the third of these classes is really identical with the second; only the amounts dissolved are so small that they cannot be detected by the analytical means at our disposal. One of the most important properties of solutions of liquids in liquids is their vapor pressure, which plays an important part in processes of fractional distillation. (See **DISTILLATION.**) When two liquids, A and B, are mixed, the vapor pressure of either undergoes a

diminution: *A* in the solution is less volatile than in the free state, and so is *B*. The vapor pressure of each in the solution is termed its "partial vapor pressure," and the total vapor pressure of the solution is equal to the sum of the diminished, partial vapor pressure of its ingredients. If *A* and *B* are mutually soluble to a limited extent, two solutions may be formed (viz., *A* in *B* and *B* in *A*), of which the partial as well as the total vapor pressures are respectively equal. Take, for instance, water and ether; if shaken up in sufficient relative quantities and then allowed to stand undisturbed, they will form two distinct liquid layers, the upper a saturated solution of water in ether, the lower a saturated solution of ether in water; the partial vapor pressure of the water in the upper equals the partial vapor pressure of the water in the lower solution; the partial vapor pressure of the ether in the upper equals the partial vapor pressure of the ether in the lower solution; and hence, the total vapor pressure of the upper solution equals the total vapor pressure of the lower. Analogous relations are found in all cases examined.

The solubility of solids in liquids is invariably limited. As a rule it increases with the temperature, but cases are known (e.g., that of anhydrous sodium sulphate, with respect to water) in which an elevation of temperature causes a decrease in solubility. A fact important to remember is that if a solid is capable of existing in two or more different modifications (e.g., in different allotropic forms, or say in an anhydrous form and one or more forms containing water of crystallization, etc.), each modification has its own solubility, and a solution exactly saturated with the more soluble modification is more or less "supersaturated" with the less soluble one. Bearing in mind that the supersaturation of a solution is destroyed, with rapid separation of the excess of dissolved substance, when a trace of the latter is introduced into the solution, the following experiment may serve to illustrate the point under consideration: Let ordinary Glauber's salt, i.e., sodium sulphate containing 10 molecules of water of crystallization ( $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ ), be heated to boiling with about one-half its weight of water, in a flask whose mouth is loosely closed with a plug of cotton (to keep out particles of Glauber's salt that may be floating in the air). If the solution thus obtained be cooled to  $-10^\circ \text{C}$ ., a sodium sulphate containing seven molecules of water of crystallization ( $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$ ) will separate out, and when the separation is complete the mother liquor will be exactly saturated with respect to this salt. Now,  $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$  has a greater solubility than  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ . Hence, the saturated mother liquor of  $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$  must evidently be supersaturated with respect to  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ . As a matter of fact, if a trace of the latter be now introduced into our mother liquor, a new crystallization will set in, a mass of  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  separating out and leaving the solution exactly saturated, this time with respect to this latter form of the salt. Such, as well as a host of other phenomena, complicate exceedingly the problem of discovering a precise relationship between the solubility of substances in various solvents and their nature.

**Solid Solutions.** The existence of solutions in the solid state has only been recognized within recent years. It was mentioned in the article on diffusion (q.v.) that cases of diffusion have been

actually observed in solids. But there is also an increasing number of indirect proofs that many homogeneous solid mixtures are true solutions, i.e., might be formed by the interdiffusion of their ingredients, although actually such a process would of course be very slow. Isomorphous crystalline mixtures, while homogeneous, may not be solutions at all; for it is possible that in them free diffusion cannot take place, the molecules of either of the ingredients being controlled by the forces that determine the crystalline form of the whole; but this is not certain. Among solid solutions containing fluids may be mentioned the well-known case of metallic palladium and hydrogen gas. The two were formerly supposed to combine chemically, forming the compound  $\text{Pd}_2\text{H}$ . But the composition of this substance has now been shown to vary with the temperature. Hence it cannot be considered as a chemical compound. See **CHEMISTRY**; **ISOMORPHISM**.

**Osmotic Pressure.** It may be seen from the above that a theory of solutions, in the full sense of the term, does not yet exist. Some of the most important questions with regard to solutions remain unanswered, and the known facts are mostly uncorrelated; in brief, the subject is largely not yet rationalized.

In one of its phases, however, the subject of solutions has, within recent years, received a development which must be counted among the most brilliant scientific achievements of our time. The achievement in question is based on the most characteristic property of solutions, viz., the capacity of the "solute" (i.e., the dissolved substance) to diffuse within the solution until the concentration of the latter is the same at all its points. Let an aqueous solution of sugar, for instance, be placed at the bottom of a vessel, and let some pure water be introduced over it, cautiously, so as not to disturb the solution; the result will be that the sugar will gradually diffuse upward, and after a certain length of time the liquid will have a perfectly uniform composition throughout. Now, to cause this motion of the sugar upward, against gravity, there must obviously be some force. An analogous case that readily suggests itself to the mind is that of gases. A gas, too, will flow upward, and, like a substance in solution, will distribute itself evenly within an available volume. Of course, when a gas is evenly distributed within a vessel, it still exercises pressure on the walls, while in the case of a substance in solution, once diffusion is over, there would seem to be no evidence of the existence of a pressure. Yet there, too, a pressure must exist; for let a new volume of pure water be placed over our diluted solution of sugar, and diffusion upward against gravity, as well as in all other directions from points of higher to points of lower concentration, will recommence.

All this suggests that, in general, the properties of matter in a highly dilute state (i.e., when a small mass occupies a large volume) may be the same whether the dilute state is that of a gas or that of a substance in solution. For in either of those states matter possesses the most important characteristic of gases, viz., the capacity for expanding indefinitely. The problem therefore arises, to ascertain whether the laws of the interrelation of pressure, volume, and temperature of substances in solution are not similar to, or identical with, the corresponding laws of gases—a problem that can be solved only

by experimental inquiry. The volume and temperature are evidently those of the solution and can be easily measured. So the solution of the problem depends on a method for measuring the pressure of the solute. To measure this directly, it is necessary to employ an apparatus by means of which it would be possible to exert pressure upon the solute without at the same time exerting pressure upon the solvent. Such an apparatus would show the resistance offered by the solute alone and would thus furnish a measure of its pressure. Let, for instance, an aqueous solution of sugar be placed in a cylindrical vessel with a tight-fitting piston just touching the solution. If the piston is made of a solid impermeable material, then external pressure upon it will be resisted by the solution as a whole, most of the resistance being of course offered by the water (which is highly incompressible). If, on the other hand, the piston is made of some permeable filtering material, then external pressure upon it will scarcely be resisted at all, the solution as a whole passing through it. Evidently, to answer our purpose, the piston must be made of a semipermeable material, through which the water, but not the sugar dissolved in it, could pass freely. By means of such a piston alone could we compress the sugar without compressing the water and thus ascertain the resisting pressure of sugar within the volume of the solution, as we might ascertain the pressure of a gas within an ordinary vessel.

The best artificial semipermeable material thus far discovered, especially well adapted for separating water from dissolved sugar, is a membrane of ferrocyanide of copper, formed by the action of potassium ferrocyanide upon copper sulphate. Pfeffer, who was the first to employ this substance for measuring the pressure of substances in solution, proceeded as follows: He filled a porous clay cylinder with a solution of copper sulphate and immersed it in a solution of potassium ferrocyanide; the two solutions, penetrating into the clay from the opposite sides, yielded a precipitate of copper ferrocyanide where they met within the walls of the cylinder, the walls serving to impart to the precipitated membrane considerable mechanical resistance. In recent years H. N. Morse has greatly improved the preparation of such osmotic cells and has carried out with them a large number of measurements of unexcelled precision. To return to Pfeffer's experiment: the osmotic cell was filled with a solution of sugar, its upper end was tightly closed with a lid bearing an ordinary

mercury manometer, and the apparatus was placed in pure water so that the level of the latter was precisely the same as that of the solution within. To understand the phenomenon that followed, imagine a cylindrical vessel *ABCD* in which, say, air has been compressed within the volume *EFCD*, while the space *ABFE* is empty; if we relieve the piston *EF*, it will be driven up by the expansive power of the air until it is stopped by *AB* or by some other resistance; if, instead, we hold up the cylinder

*EFCD* were filled with a solution of sugar and *ABFE* were pure water, while *EF* were a semipermeable membrane: Either the piston would move upward or the entire liquid volume (pure water plus solution) would move in the direction of the dissolved sugar; in either case the cause would be the expansive power of the sugar and the result an increase of the volume occupied by it, i.e., an addition of pure water to the solution. As a matter of fact, in Pfeffer's apparatus, the semipermeable walls being fixed, the expansive power of the dissolved sugar caused pure water to enter the clay cylinder. The increasing amount of liquid naturally caused an increasing compression of the air within the cylinder, and finally a point was reached when the expansive power of the sugar was no longer capable of overcoming the resistance of the air, the latter having grown precisely equal to it. Then equilibrium ensued, the mercury manometer showing the pressure of the air within the cylinder, and hence the equal of that pressure—the "osmotic pressure" of the sugar in solution. Similar experiments showed: (1) that the osmotic pressure of sugar and other substances in dilute solutions is proportional to the concentration, i.e., inversely proportional to the volume of the solution; (2) that the osmotic pressure of sugar and other substances in dilute solution is proportional to the absolute temperature (i.e., the centigrade temperature plus 273 degrees); (3) that the osmotic pressure of substances in dilute solution is equal to the pressure that the solute would exert if removed from the solution, vaporized, and inclosed within an empty volume equal to that of the solution, at a temperature equal to that of the solution. In brief, the laws of gases, viz., the law of Boyle and Mariotte, the law of Charles and Gay-Lussac, and Avogadro's rule, hold good in the case of dilute solutions as they do in the case of gases. It has been shown, besides, that the osmotic pressure of all very dilute solutions is the same no matter what the solvent.

The importance of these results will be evident to those who realize that the science of chemistry is based on the laws of the gaseous state, Avogadro's rule, which embodies those laws, being the only sure guide in finding those comparable units of compounds—their molecular weights. (See CHEMISTRY; MOLECULES—MOLECULAR WEIGHTS; AVOGADRO'S RULE; ATOMIC WEIGHTS; GASES, GENERAL PROPERTIES OF; ETC.) Yet a majority of compounds are nonvolatile, and therefore our theoretical knowledge of them remained uncertain, and in many cases vague, until the above results proved that what we can learn of a substance by studying it in the gaseous state we can learn with equal certainty by studying it in dilute solution. Very few indeed are the substances that are neither volatile nor soluble in any liquid.

Direct methods for measuring osmotic pressure, like the one described above, have been of importance only in demonstrating the fundamental laws; the experimental difficulties involved render their use for determinations of molecular weights practically impossible. But, on the other hand, it has been shown that the depression of the freezing point or the elevation of the boiling point caused by dissolving a substance in a given liquid is proportional to the osmotic pressure in the solution; and so, molecular weights are now generally determined by observing the freezing points or the boiling points

of solutions. (See MOLECULES—MOLECULAR WEIGHTS; FREEZING POINT; BOILING POINT.) At first, experimental research seemed to show that compounds of three important classes, viz., acids, bases, and salts, do not obey the laws of osmotic pressure; their osmotic pressure was found to be much higher than it should be theoretically. But Arrhenius' theory of electrolytic dissociation (see DISSOCIATION) soon came to add itself to the theory of osmotic pressure, and, instead of disproving it, only furnished further proof of its correctness, just as the phenomena of chemical dissociation, when correctly understood, had once furnished additional proof of the reliability of Avogadro's rule (q.v.) for gases.

**History.** The history of our subject commences perhaps with Graham's researches on the diffusion of substances in solution, dating back to 1851. Ten years later Graham investigated the well-known method of dialysis, based on the fact that many animal and vegetable membranes are permeable to water and the so-called "crystalloids," but impermeable to "colloids" (q.v.). In 1867 Traube discovered that copper ferrocyanide is permeable to water, but impermeable to sugar, and more or less impermeable to many other substances. Ten years later Pfeffer published the researches mentioned above (*Osmotische Untersuchungen*, Leipzig, 1877). Finally, in 1886, on the basis principally of the experimental researches of Pfeffer, De Vries, and Raoult, Van't Hoff worked out the theory of dilute solutions, which has extended the domain of rational chemistry as few general ideas had done before. The principal names connected with the further development of the theory are those of Nernst, Ostwald, and Arrhenius. In America Arthur A. Noyes has made a number of original contributions of recognized value. For an account of the physiological importance of osmotic phenomena, see OSMOSIS.

#### SOLUTION OF CHLORINATED SODA.

See LABARRAQUE'S SOLUTION.

**SOLUTREAN EPOCH.** See PALEOLITHIC PERIOD.

**SOL'VAY.** A village in Onondaga Co., N. Y., adjoining Syracuse on the west, and on the Delaware, Lackawanna, and Western and the New York Central and Hudson River railroads, and the State Barge Canal. Chemicals, pottery, and iron are manufactured. The village has a Carnegie library and a fine high-school building. Pop., 1900, 3672; 1910, 5139.

**SOLVAY,** söl'vā, ERNEST (1838-1922). A Belgian manufacturing chemist, known as the Carnegie of Belgium. His great achievement was the development of the ammonia process for the manufacture of soda (q.v.) and its establishment on a commercial basis. His first plant was erected in Couillet, Belgium, in 1863, the process being continually improved until 1872, when patents covering it in its present form were granted him. He then established plants in all parts of the world and by 1880 was manufacturing half, and by 1913 practically all, of the world's supply of soda. He became interested in social democracy, founding the Solvay Institute in Brussels for its advancement, and was active in varied philanthropic work. On his seventy-fifth birthday he made gifts of \$100,000 each to the universities of Paris and Nancy, and divided \$1,000,000 among Belgian educational and charitable institutions and the employees of his company. He was made Grand Officer of the Order of

Leopold by King Albert of Belgium, received the Lavoisier medal of the Institute of France and a grand medal from the University of Paris, and was elected president of the Belgian Academy of Letters. During the Great War he was active in relieving distress among the Belgians, although much of his fortune was taken from him during the German occupation of his country.

**SOL'WAY FIRTH.** An arm of the Irish Sea, separating Cumberland, England, from Scotland, and forming in its upper part the estuaries of the Esk and Eden (Map: Scotland, E 5). Its length is 33 miles and its width increases gradually, although irregularly, to upward of 20 miles. Its spring tides, which rush in as a bore from three to six feet high, advance at the rate of eight to ten miles an hour.

**SOL'YMAN** (or **SULEIMAN**) II (c.1495-1566). Sultan of the Turkish Empire, surnamed **THE MAGNIFICENT**. In September, 1520, he succeeded his father, Selim I (q.v.). He overthrew the rebellious Governor of Syria, repressed the Egyptian Mamelukes, and concluded a treaty with Persia. In 1521 he took Belgrade, the key to Hungary. He next drove the Knights of St. John from Rhodes (1522). Afterward he devoted himself to improvements in administration and to preparations for an onslaught upon Hungary (q.v.). On Aug. 29, 1526, he overwhelmed the army of King Louis II at Mohács. In 1529 he was summoned to Hungary to aid his protégé, John Zápolya, Waywode of Transylvania, then contesting the crown with Ferdinand, brother of the Emperor Charles V. He laid siege to Vienna, but after a number of unsuccessful assaults retreated. In 1532 he laid Styria waste and again advanced to the neighborhood of Vienna, but was baffled by the resistance of the Hungarian fortress of Güns, and the advance of the Imperial army under Charles V forced him back. Soon after this the Sultan waged a successful war against Persia. In 1535 Solymán concluded with Francis I the famous treaty which opened the commerce of the Levant to the French flag alone. By 1541 the Turks were in permanent possession of the heart of Hungary. In 1542 the combined French and Turkish fleets ravaged the Italian coasts and pillaged Nice. The Turks were now supreme in the Mediterranean; in 1551 Tripoli fell into their hands. A second and third war with Persia, now in a state of semi-subjugation, a brilliant naval victory (1561) over the Knights of Malta and their allies, the Spaniards, an unsuccessful siege of Malta (1565), and a fresh expedition to Hungary (1566), were the chief events of the remainder of his reign. Solymán encouraged literature, and did much for the improvement of the laws as well as for the military organization of the state. See **TURKEY**.

**SOMA** (Skt., from *su*, to press). An Oriental plant identified, but not certainly, with the *Sarcostemma acidum*. It was at first deified in India on account of the intoxicating nature of its juice, and was then identified with the moon. The plant is plucked up by moonlight in the mountains and is crushed between two stones. It is then filtered through cloth and is allowed to ferment; and being thickened with meal and sweetened, it is drunk by the priests after being offered to the gods. At the present day only the priests may drink of it. The Vedic hymns (see **VEDA**) are chiefly concerned with the Soma cult. The deification of the plant had already begun

before the separation of the Indo-Iranians. In the Persian cult, *haoma*, the Iranian equivalent of the Indian *soma*, is a god, but also the tree of life. It is probable that the name has been applied to different plants even in India. Consult: Sir William Muir, *Original Sanskrit Texts*, vol. ii (London, 1871); W. Caland and V. Henry, *L'Agnistoma, description complète de la forme normale du sacrifice de soma dans le culte védique* (2 vols., Paris, 1906-07); E. W. Hopkins, *Religions of India* (Boston, 1895); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); L. D. Barnett, *Antiquities of India* (London, 1913).

**SOMADEVA**, sô-mâ-dâ-vâ (eleventh century A. D.). A Sanskrit author. Of his life nothing is known, except that he was probably a native of Kashmir. He composed but one work, the *Kathāsaritsāgara*, or "Ocean of Streams of Stories," which he began about 1070. This is the longest and most important collection of stories which has been preserved in Sanskrit. It contains 22,000 *glokas*, and is divided into 124 chapters, called *tarangas*, or "waves." These fairy tales are told in the main for their intrinsic interest, not to point a moral. Although in the main Brahmanistic in spirit, Buddhist influence is frequently apparent. The *Kathāsaritsāgara* was edited and translated into German by Brockhaus (3 vols., Leipzig, 1839-66), edited by Durgaprasad and Parab (Bombay, 1889), and translated into English by Tawney (2 vols., Calcutta, 1880-87). Selected stories have been translated into German by J. Hertel in *Bunte Geschichten vom Himalaya* (Munich, 1903), and into Italian by E. Bartoli, *Devasmīṭā, novella indiana* (Bari, 1908). Consult J. Speyer, *Studies about the Kathāsaritsāgara* (Amsterdam, 1908).

**SOMALI**, sô-mû'î. A Hamitic or Ethiopian people in the extreme east of Africa, partly in Italian, partly in British territory. They are tall (1.725 m.), dark skinned, and dolichocephalic. The infusion of negro and later of Semitic blood causes much variation in color. Their activities are the raising of grains, coffee, and spices, camel breeding, and coastwise industries. The clothing of the men is a toga-like robe of cotton. They are neither mechanical nor artistic; always at strife, they pride themselves on their weapons, of African pattern—lances, edged weapons, and rawhide shields. Their social organization is patriarchal, clans and chiefs being numerous. Their religion is fanatical Mohammedanism.

**SOMALI COAST.** See SOMALILAND.

**SOMALILAND**, sô-mû'î-lând. A country forming the eastern peninsula of Africa, lying between Eritrea (Italian) and British East Africa, and consisting of territories under the jurisdiction of France, Great Britain, Italy, and Abyssinia (Map: Africa, J 4). Abyssinian Somaliland extends inland from the borders of the other three territories; its extent is not clearly defined, and its population not definitely known.

**French Somali Coast.** A French colony on the Strait of Bab el Mandeb and the Gulf of Aden. It extends from Eritrea on the north to British Somaliland on the southeast, and with its dependencies is bounded on the west and south by Abyssinian territory. The total area is variously estimated at from 5800 to 46,000 square miles. The population was estimated in 1911 at 213,000. The coast is generally hilly, and the interior for the most part a plateau with

elevation of about 4000 feet. The country is almost without industries. Its trade is of some importance, but to a considerable extent is transit. Imports and exports (general trade) were valued at 7,114,000 and 3,468,000 francs respectively in 1900; in 1913, 33,917,000 and 47,704,000. Among the imports are cotton goods, foodstuffs, tobacco, and ironware. The important exports include coffee, hides and skins, ivory, and gold. Imports in 1913 valued at 7,832,000 francs came from France, and exports amounting to 3,561,000 francs were sent to that country. The ports are in communication with Aden by local boats, and French and British vessels call regularly. In the overseas trade in 1912 there were entered 247 vessels, of 737,748 tons, and cleared 246, of 734,988 tons. The chief port is Jibuti, from which a railway extends into Abyssinia; the line is being extended, with Addis Abeba as the objective; 81 miles are in French territory.

The country has been administered since 1899 by a governor and by a general council of six members, three chosen from government officials and three from leading residents. In 1912 the local budget balanced at 1,585,000 francs; expenditure of France (1914 budget), 667,500 francs. The natives belong to the Danakil and Galla races. The principal towns are Jibuti, the capital (pop., 16,535 in 1912), Obok, Tadjurah, Ambado, Gobad, and Sagallo.

Obok has been in the possession of the French since 1862. In 1884 they began active operations in this region. They acquired Sagallo and Tadjurah in 1884; and Ambado in 1885. In 1888 a port was created at Jibuti. In 1887 and 1891 the boundaries of the country were definitely fixed with England and with Italy, and in 1896 with Abyssinia on the west. Consult André Bacquart, *Une colonie de commerce française* (Paris, 1907).

**SOMALILAND PROTECTORATE.** A British protectorate on the Gulf of Aden, extending eastward from the French Somali coast and bounded inland by Abyssinian and Italian territory. The area is about 68,000 square miles. The country is a sandy steppe having few undulations, though surmounted here and there by granite and basaltic mountains from 4500 to 6800 feet in height. The climate at the coast is rather unhealthy for Europeans. The natives are almost entirely nomadic, except in the coastal towns, and graze their flocks and herds over considerable areas in the wet season; in the dry season they remain near the wells. All transport is by pack animals, chiefly camels and donkeys. The wealth of the people consists in live stock. Exports are largely hides and skins, cattle and sheep, gums, ostrich feathers, salt, ivory, and gold. The principal imports are rice, dates, cotton piece goods and shirtings, sugar, and ironware. The chief ports are Zeila, Bulhar, and Berbera. Imports and exports were valued at £290,567 and £221,256 respectively in 1906-07; in 1913-14, £238,218 and £216,596. Revenue in 1913-14 was £29,646, and expenditures £68,646. The estimated number of inhabitants, who are practically all Mohammedan, was 359,819 at the end of 1913. The 1911 census returned 344,323. Berbera, the chief town and capital, has upwards of 30,000 inhabitants in the trading season; Bulhar about 7300; Zeila about 7000. The protectorate, established in 1894, is administered by a commissioner, with British officials at the coast towns. Consult

H. G. C. Swayne, *Seventeen Trips through Somaliland* (2d ed., London, 1900), and R. E. Drake-Brockman, *British Somaliland* (ib., 1912).

**Italian Somaliland.** A colony and protected territories of Italy, extending along the coast from British Somaliland on the north to the Juba River, British and Abyssinian territory lying to the west. The country comprises northern Somaliland (consisting of protectorates) and southern Somaliland (the colony). The area of the former is stated at 189,000 square kilometers; of the latter, at 168,000 square kilometers; total, 357,000 (137,838 square miles). Northern Somaliland comprises the Sultanate of the Mijertius (capital, Bereda), the Sultanate of Obbia (capital, Obbia), and the territory of the Nogal (capital, Illig). The colony, formerly called Benadir, is divided into four districts: Mogadiscio, Giumbo, Lugh, and Mahadei Uen. The surface of the country, resembling in general that of British Somaliland, is flat along the coast and elevated in the interior. The country is largely arid, having scarcely any forested areas and few streams; the Schebehi, the largest stream, fails to reach the sea. The climate is fairly favorable. The interior of the country is not fully explored, owing in part to the stubborn hostility of the natives. The natives are chiefly nomadic graziers. The leading imports include cotton goods, rice, sugar, petroleum, and lumber. The chief export is hides and skins; other exports of some note are butter, gums, cotton, and live stock. Imports and exports (special trade) were valued at 4,239,000 and 1,691,000 lire in 1909-10; in 1912-13, 6,088,000 and 2,063,000. The transit trade is small. There is no railway. The principal ports are Mogadiscio and Obbia. The population is estimated at about 365,000. The country is administered by a governor. The 1913-14 budget showed estimated revenue of 6,031,000 lire (including 3,629,000 lire state grant) and expenditure 5,771,000 lire. The southern part of the protectorate was acquired by Italy in 1889, when the Sultan of Obbia placed the territory from 2° 30' to 5° 33' north under Italian protection. In the same year the protectorate was extended farther north, and in 1892 the cession of territory by the Sultan of Zanzibar increased the country to its present proportions.

**SOMASCHIANS**, sô-mäs'ki-anz. A Roman Catholic congregation of priests founded by St. Jerome Emiliani (1491-1537). The mother-house was at Somasco, Italy. The order was confirmed by Paul III in 1540; after it had been for a short time united with the Theatines, Pius V enrolled it among the religious orders in 1568, assigning it the rule of St. Augustine. From 1616 to 1647 the French *Doctrinaires* (see DOCTRINE, FATHERS OF CHRISTIAN) were united with them. Now it has only 16 houses, all but one in Italy. Consult Heimbucher, *Die Orden und Congregationen der katholischen Kirche* (Paderborn, 1897).

**SOMATOL'OGY** (from Gk. *σῶμα*, *sōma*, body, + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). That division of anthropology which treats of the anatomy and physiology of mankind, especially by a comparative survey of different races from this point of view. See ANTHROPOMETRY; INDEX.

**SOMBART**, zôm'bärt, WERNER (1863- ). A German political economist, born at Ermsleben am Harz. He studied law and political economy at the universities of Pisa and Berlin, was syndic

of the Bremen Chamber of Commerce in 1888-90, and served as professor of political economy at Breslau from 1890 to 1906, when he became professor at the Handelshochschule of Berlin. His publications include: *Die römische Campagna* (1888); *Sozialismus und soziale Bewegung im 19. Jahrhundert* (1896), which passed through more than 40 German editions and was translated into more than 20 foreign languages, with an English translation by A. P. Atterbury as *Socialism and the Social Movement in the Nineteenth Century* (1898); *Der moderne Kapitalismus* (2 vols., 1902); *Die deutsche Volkswirtschaft im 19. Jahrhundert* (1903); *Gewerbewesen* (2 parts, 1904); *Die gewerbliche Arbeiterfrage* (1904); *Das Proletariat* (1906); *Warum gibt es in den Vereinigten Staaten keinen Sozialismus?* (1906); *Kunstgewerbe und Kultur* (1908); *Das Lebenswerk von Karl Marx* (1909); *Die Juden und das Wirtschaftsleben* (1911; Eng. trans. by M. Epstein as *The Jews and Modern Capitalism*, 1913); *Die Zukunft der Juden* (1912); *Der Bourgeois* (1913); *Krieg und Kapitalismus* (1913); *Luxus und Kapitalismus* (1913). In 1915 appeared *The Quintessence of Capitalism*, a translation by Epstein.

**SOMBRERETE**, sôm'brä-rä'tä. A town in the State of Zacatecas, Mexico, 85 miles northwest of Zacatecas, in a mountainous district celebrated for its rich silver mines, from which Sombrete derives all its importance (Map: Mexico, G 6). Pop., 1900, 10,082.

**SOMERS**, sôm'ërz, or **SUMMERS**, SIR GEORGE (1554-1610). An English mariner, born at or near Lyme Regis, Dorsetshire. He was an active promoter of the London company formed to colonize Virginia, and in 1609 he sailed for America in command of a small fleet. His squadron was scattered by a hurricane and Somers's vessel was wrecked on the Bermuda Islands, which Somers took possession of in the name of England. He died there while on a second visit. One of the many contemporary versions of his shipwreck is said to have given Shakespeare the setting for *The Tempest*.

**SOMERS, JOHN, LORD** (1651-1716). An English lawyer and statesman, born in Worcester and educated in private schools and at Trinity College, Oxford. He was called to the bar in 1676, distinguished himself in the trial of the seven bishops, became leader in the negotiations of the discontented nobles with William III, and was an important member of the first Parliament after the revolution of 1688-89. The Bill of Rights was drafted by a committee of which he was chairman, and its chief defense in Parliament was intrusted to him. He was Solicitor-General in 1689, Attorney-General in 1692, and Lord Keeper in 1693, and became Speaker of the House of Lords a few months later. In 1697 he was appointed Lord Chancellor of England, and raised to the peerage. He was removed from the chancellorship in 1700, impeachment proceedings being begun against him, which, however, were soon dropped. Consult Henry Maddock, *An Account of the Life and Writings of Lord Chancellor Somers* (London, 1812).

**SOMERSET**, sôm'er-sët. A city and the county seat of Pulaski Co., Ky., 79 miles south of Lexington, on the Cincinnati, New Orleans, and Texas Pacific Railroad (Map: Kentucky, F 5). It has large railroad shops, a knitting mill, and manufactories of spokes, staves, and lumber. The city has a Carnegie library. Pop., 1900, 3384; 1910, 4491.

**SOMERSET**, sŭm'ēr-sĕt. A town in Bristol Co., Mass., 5 miles north of Fall River, on the New York, New Haven, and Hartford Railroad and on the Taunton River (Map: Massachusetts, E 5). It contains the Hood Library. Stoves are the leading manufactured articles. Pop., 1900, 2241; 1910, 2798; 1915 (State census), 3377.

**SOMERSET**, EARL OF. See CARR, ROBERT.

**SOMERSET**, EDWARD. See WORCESTER, MARQUIS OF.

**SOMERSET**, EDWARD SEYMOUR, DUKE OF (c.1506-52). See SEYMOUR.

**SOMERSET**, FITZROY JAMES HENRY, LORD; first BARON RAGLAN. See RAGLAN.

**SOMERSET**, LADY HENRY (ISABEL) (1850- ). A British social reformer. The eldest daughter of the third Earl Somers, she married Lord Henry Somerset in 1873. Soon afterward she became interested in temperance reform, in behalf of which she addressed large audiences, both in England and in America. She founded in 1895 the industrial farm colony for inebriate women at Duxhurst, Surrey, the first institution of its kind in England. She also established and conducted for 15 years a home for training workhouse children, and a home for children from the National Society for the Prevention of Cruelty to Children. She was elected president of the National British Women's Temperance Association and of the World's Women's Temperance Union. She established and edited the *Woman's Signal*, a journal devoted to women's work, and published several books and pamphlets on social reform.

**SOMERSETSHIRE**, -shĭr. A maritime county in the southwest of England (Map: England, C 5). Area, 1615 square miles. Pop., 1901, 385,111; 1911, 407,304. The surface is diversified with lofty hills and barren moors, rich vales and marshy levels, thousands of acres of the latter being below high-water mark, depending for security on sea banks and sluices. The hills are divided into several ranges running east and west, the Mendips being conspicuous. In the west is the wild district of Exmoor (q.v.). The chief river is the Bristol Avon. The wheat and barley grown around Bridgewater are famous; grazing and dairy farming form leading branches of husbandry; and the cheese of Cheddar is noted. The hilly districts are rich in minerals, especially iron, with some lead and freestone, but are little worked. The manufactures are woolen cloth, coarse linens, lace, silk, and gloves. Capital, Taunton. British camps are numerous on the hills, and extensive remains of stone circles are visible at Stanton Drew, near Bristol. Consult *Victoria History of the County of Somerset*, edited by W. Page, vols. i-ii (London, 1906-11).

**SOMERS** (sŭm'ērz) ISLANDS. A group of islands in the Atlantic Ocean. See BERMUDA ISLANDS.

**SOMERSWORTH**, sŭm'ēr-z-wŭrth. A city in Strafford Co., N. H., five miles north of Dover, on Salmon Falls River, and on the Boston and Maine Railroad (Map: New Hampshire, J 7). There are a public library and a municipally owned theatre. Somersworth is noted chiefly for the manufacture of textiles and large bleachery and dye works. Other manufactures are shoes, boxes, wooden ware, etc. Settled in 1729, Somersworth was incorporated as a town in 1754. Pop., 1900, 7023; 1910, 6704.

**SOMERVILLE**, sŭm'ēr-vĭl. A city in Middle-

sex Co., Mass., two miles northwest of Boston, on the Mystic River, here spanned by two bridges. and on the Boston and Maine Railroad (Map: Massachusetts, E 3). It is a residential and manufacturing city, with many places of historic interest. Broadway, over which Paul Revere passed on his famous ride; Central Hill, occupied by a redoubt during the siege of Boston; the old Powder House (storehouse for the American army); Prospect Hill, said to be the scene of the first unfurling of the American flag, and the headquarters of Generals Greene and Charles Lee, are especially noteworthy. The city has a large public library, Somerville Hospital, Roman Catholic Home for the Aged, Somerville Home for the Aged, a State armory, and fine high school. Slaughtering and meat packing, cloth bleaching and dyeing, distillation of liquors, and the manufacture of metal tubing, desks, pictures and frames, are leading industries.

The government is vested in a mayor, chosen annually, and a unicameral council. The assessed valuation of real and personal property in 1914 was \$74,946,894, and the net debt (Jan. 1, 1915) \$1,616,000. The city spent for maintenance and operation \$1,699,000, the main items being: For schools, \$455,750; for streets, \$124,600; for protection of person and property, \$246,750; for health and sanitation, \$161,200; for water works, \$176,759. The water works are owned by the city. Pop., 1900, 61,643; 1910, 77,236; 1915 (State census), 86,854; 1920, 93,091. Settled about 1631, Somerville was a part of Charlestown until separately incorporated in 1842. In 1871 it was chartered as a city. Within the limits of the present city a large body of Hessian prisoners were quartered in 1777-78. Consult: Samuels (editor), *Somerville, Past and Present* (Boston, 1897), and Hurd, *History of Middlesex County* (Philadelphia, 1890).

**SOMERVILLE**. A borough and the county seat of Somerset Co., N. J., 36 miles west by south of New York City, on the Raritan River, and on the Central Railroad of New Jersey (Map: New Jersey, C 2). It is an attractive residential place and has a public library. The principal manufactures are woolen cloth, clothing, stoves, iron pipe, etc. Pop., 1900, 4843; 1910, 5060; 1915 (State census), 6038.

**SOMERVILLE**, ALEXANDER (1811-85). A Canadian journalist. He was born at Springfield, Scotland, and early entered the army. While with his regiment at Birmingham in 1832 he was charged with an act of insubordination and was sentenced to 200 lashes on the bare back. One hundred lashes were inflicted. This brutal episode was the occasion of a parliamentary discussion, with the result of lessening the harshness of British army discipline. Somerville served five years longer, resigning from the army in 1837. For 20 years (1838-58) he was a contributor to leading British journals, and then he went to Hamilton, Upper Canada, where he edited the *Canadian Illustrated News*, contributed to the *Spectator*, and wrote sketches for the *Montreal Gazette*. He published: *Autobiography of a Workman* (1849); *History of the Fiscal System* (1850); *The Whistler at the Plough* (1852), being his collected contributions to the chief British newspapers; *The Conservative Science of Nations* (1860), containing an account of his military service, with his punishment at Birmingham; *Canada a Battle Ground* (1862); *A Narrative of the Fenian Invasion of Canada in 1866* (1867).

**SOMERVILLE, EDITH ANNA CENONE** (?-). An Irish novelist, who habitually signed herself E. C. Somerville, and wrote in collaboration with "Martin Ross" (Violet Martin, q.v.) a series of highly entertaining stories and novels, the most popular of which, both in America and England, was *The Experiences of an Irish R. M.* (1899). Miss Somerville, educated at home at Drishane House, Skibbereen, County Cork, studied art in Paris and at the Royal Westminster School of Art in London. She had exhibitions of her pictures in Dublin and in London; and she was active as an illustrator, especially of children's picture books and of sporting picture books—she was herself a devoted sportswoman and became master of the West Carbery Foxhounds. For the books she and Miss Martin wrote together, see the article on the latter.

**SOMERVILLE, MARY** (1780-1872). A writer on mathematics and physical science, born at Jedburgh, Scotland. In 1804 she married Captain Greig of the Russian navy, and removed to London. Widowed after three years, she thereafter devoted herself to study. In 1812 she married her cousin, Dr. William Somerville. After presenting a successful paper on the *Magnetic Properties of the Solar Spectrum* to the Royal Society in 1826 Mrs. Somerville was invited by Lord Brougham in the following year to try to popularize for the English public Laplace's great work, the *Mécanique Céleste*. This was published as the *Celestial Mechanism of the Heavens* in 1831. *The Connection of the Physical Sciences* was published in 1834, *Physical Geography* in 1848, and *Molecular and Microscopic Science* in 1866. The Mary Somerville scholarship in mathematics for women was founded at Oxford University in her honor. An autobiography, edited and supplemented by a daughter, Martha Somerville, was published in 1873.

**SOMERVILLE, WILLIAM** (1675-1742). An English poet of an ancient family, born at Colwich, in Staffordshire. Somerville is remembered mainly for his blank-verse poem *The Chase* (1735), which vividly depicts his favorite sport. He also wrote some good verse fables (1725, 1727), a burlesque of rural games entitled *Hobbinol* (1740), and *Field Sports* (1742). His poems with a *Life* are in the collections of Johnson and Chalmers. A collective edition of his poetical works appeared in 1801. Consult also *The Chase*, with memoir by G. Gilfillan (Edinburgh, 1859).

**SOMMA, sôm'mâ, LUTGI** (1834-84). An Italian pediatricist. Born and educated at Naples, he became professor of pediatrics there in 1874. Somma was the founder of pediatrics in Italy. Among his writings are: *Tratto d'igiene per gli ospizii degli esposti* (1871); *Clinica pediatrica dell'Ospizio dell'Annunziata di Napoli* (1875).

**SOMME, sôm.** A small river of north France, entering the English Channel through an estuary which is navigable for ocean steamers to Saint-Valéry (Map: France, N., G 2). From that point a lateral canal follows the river past Amiens to Saint-Quentin, whence first-class water-ways communicate with the Oise and the Scheldt.

**SOMME.** A maritime department of north France (Map: France, N., H 3). Area, 2443 square miles. Pop., 1901, 537,848; 1911, 520,161. The chief river is the Somme, which traverses the department from southeast to northwest. Somme is mostly level, but in some parts is

marshy. The department produces corn and garden fruits. The raising of cattle is carried on to a great extent. The chief manufactures are velvets, chemicals, woollens, cottons, linens, silk, leather, and tapestries. Capital, Amiens. The department was formed mainly out of the old Province of Picardy.

**SOMNAM'BULISM** (from Lat. *somnus*, sleep + *ambulare*, to walk). A state intermediate between those of sleeping and waking, characterized by the performance of various acts apparently indicative of conscious control, by absence of the usual reaction to stimuli, and usually by inability to recall on awakening the thoughts or movements which have taken place during the abnormal condition. The term is often applied in popular speech to sleep-walking, which is nothing more than the expression in action of a vivid dream; it is analogous to talking during sleep, and is similarly explained.

Two distinct types of somnambulism may be distinguished: the first, artificial somnambulism, is the third stage of hypnosis. (See HYPNOTISM.) In this, the final stage, the subject is almost completely anesthetized, obeys orders by perception, and when awakened has no memory of what has elapsed during the somnambulist period. The second type, natural or spontaneous somnambulism, is a phenomenon of hysteria (q.v.). It is characterized not only by amnesia, but also by apparently normal perceptions. In spite of innumerable variations, two main forms are evident. The first frequently shows many of the symptoms of hypnosis, such as lethargy, catalepsy, partial anesthesia, etc. The subject is engrossed in a group of ideas which refer to some former highly emotional experience, and which in normal life are inhibited through constant repression. In the somnambulist state these ideas find expression in various movements; the former scene is, as it were, relived. The somnambulism of Macbeth (Act V, i) will serve as an illustration. The second form includes cases in which, to all outward appearance, the subject is normal; loss of memory continues, however, and there is frequently a decided change from the emotivity of the normal life. There are various degrees, ranging from the trance of the spiritistic medium to the complete somnambulism of double or multiple personality. See DOUBLE CONSCIOUSNESS.

Consult: D. H. Tuke, *Sleep-Walking and Hypnotism* (London, 1884); Jules Liégeois, *De la suggestion et du somnambulisme dans leur rapport avec la jurisprudence et la médecine légale* (Paris, 1888); P. M. F. Janet, *The Mental State of Hystericals* (New York, 1901), English translation by C. R. Corson; W. M. Wundt, *Lectures on Human and Animal Psychology* (3d ed., ib., 1907), English translation from second German edition by Creighton and Titchener; I. H. Coriat, *The Hysteria of Macbeth* (ib., 1912); also references under DOUBLE CONSCIOUSNESS and HYSTERIA.

**SOMNATH, sôm'nâth, or PATAN.** A town in Gujurat, Province of Bombay, India, on the Kathiavar Peninsula, 38 miles northwest of the island of Diu, on the Arabian Sea. Its port is Verawal, 3 miles to the northwest. Of great antiquity as an important commercial centre and pilgrimage resort, the town was captured by Mahmud of Ghazni in 1025 and its celebrated temple of Siva despoiled of its vast riches. Pop., 1911, 8672.

**SOM'NUS** (Lat., sleep). The Latin god of

sleep, son of Night and twin brother of Death, corresponding to the Greek Hypnos. His home was in the far west, from which he brought sleep to gods and men alike. In art he is variously represented, e.g., with eagle's wings, a butterfly, a poppy stalk, with a horn from which he poured out slumber.

**SONATA**, sô-nâ'tâ (It., from Lat. *sonare*, to sound). In music, an instrumental composition in cyclical form, originally any instrumental work as opposed to a cantata or vocal work. At first the sonata was almost identical with the suite (q.v.), but it soon abandoned the pure dance forms which the suite embodied. The violin sonata attained a somewhat perfected form before that of any of the keyed instruments. Its slow introductory first movement generally shows traces of ecclesiastical influence; the second movement, an allegro, which corresponds to the first movement of a modern sonata, was derived from vocal madrigals or part music; the third movement, which is characteristically slow, was evolved from solo vocal music, while the last movement showed elements of dance music, and was therefore a pure suite movement. Of the popular dance forms, the minuet survived the longest but was ultimately supplanted by the scherzo, while the gigue and chaconne, of which Bach left so many examples, were succeeded by the finale or rondo. The first noteworthy advance is in a set of seven sonatas for the clavier, *Frische Klavierfrüchte* (1703), by Johann Kuhnau, in which he shows a partial recognition of the relation and balance of keys. Johann Mattheson chose the gigue for the concluding movement of his sonatas, and both he and Alessandro Scarlatti did much to define and unify the sonata form. In the works of Domenico Scarlatti are found the first traces of a distinct secondary subject in the first allegro. The domain of the sonata was long monopolized by writers for the violin, and through the advances made by Locatelli, Geminani, and Tartini the sonata finally reached the four-movement type. Johann Sebastian Bach wrote many sonatas for various instruments and for combinations of instruments, but he did not aid in the direct development of the form. His son, Philipp Emanuel Bach, established the number of movements as three. Stamitz definitely established the form of the first movement by the introduction of a clearly defined second theme forming a contrast with the principal subject. He also established the principle of thematic development as against mere repetition of themes in different keys. Haydn adopts and develops further the ideas of Stamitz, and adds the minuet and rondo as essential movements of the sonata. Mozart adds grace and employs more elaborate themes and harmonies. Beethoven brought the sonata to perfection. In his greatest sonatas he attains to such a command of technical resource and emotional expression that the form seems incapable of further development. Schubert takes the form as left by his great predecessor and fills it with the contents of his individual genius. Brahms, while preserving the fundamental architectonic structure, shows that details are capable of an infinite variety of new arrangement. When occasion demands it, he does not shrink from introducing a third theme. More than any other master he proves the inherent vitality and plasticity of the form.

**Sonata Form** is a term applied to the form of the first movement of a sonata, symphony, or

chamber-music composition. The first movement of a sonata or kindred cyclical form consists of three sections: (1) the exposition, (2) the development, (3) the repetition. The first section begins with the principal subject in the tonic key. An episode consisting of some development of the principal subject leads into the secondary subject. This appears in the key of the dominant, if the movement is in major. If the movement is in minor the secondary subject is announced in the key of the relative major. Then follows some development of the secondary subject. After this the entire exposition section is repeated literally. The second or development section is devoted to a full thematic working out of either one or both the themes announced in the previous section. In the development section episodes built upon new themes may also be introduced. The third or repetition (also recapitulation) section is a repetition of the exposition section, though, in the case of orchestral works, composers generally vary the instrumentation. In this section the secondary subject appears in the key of the tonic. A more or less extended coda, constructed either upon the material already introduced or upon new material, closes the movement. Frequently the movement is preceded by a shorter or longer introduction in slow tempo. (See INTRODUCTION.) Essentially this form has not been changed since Beethoven's time. Consult: J. S. Shedlock, *Pianoforte Sonata* (London, 1895); O. Klauwell, *Geschichte der Sonate* (Leipzig, 1899); B. Selva, *La sonate* (Paris, 1914).

**SONATINA**, sô'nâ-tê'nâ (It., little sonata, diminutive of *sonata*, sonata). In music, a short sonata, with two or three movements, and themes much lighter than those of the regular sonata. Sonatinas are designed especially for young players as a preparation for sonata study.

**SONDERBUND**, zôn'dêr-bunt. A league formed in the fall of 1843 by the Swiss cantons Lucerne, Fribourg, Zug, Uri, Schwyz, and Unterwalden for the protection of the interests of the Catholic church. The Canton of Valais joined the league in 1845. In 1847 the Liberal majority in the National Assembly decreed the dissolution of the Sonderbund, and this was accomplished by force of arms in the same year. See SWITZERLAND.

**SONDERBURG**, zôn'dêr-burk. A town on the island of Alsen (q.v.).

**SONDERSHAUSEN**, zôn'dêrs-hou'zen. The capital of the Principality of Schwarzburg-Sondershausen (q.v.), Germany, 33 miles northwest of Weimar, on the Wipper (Map: Germany, D 3). The Prince's castle, in a beautiful park, contains a natural-history collection and a museum of antiquities. Sondershausen was founded in 525 and passed to Schwarzburg in 1248, and since 1909 has been united in the person of its ruler with the principality of Schwarzburg-Rudolstadt. Pop., 1910, 7759.

**SONE**, sô'nâ, ARASUKE, VISCOUNT (1849-1910). A Japanese statesman, born at Choshu. In 1872-77 he studied military science in France, but later entered the civil service. From 1881 to 1890 he was counselor of the Legislative Bureau and held other positions. He then became Secretary of the Lower House, and in 1893-97 represented Japan at Paris. He served as Minister of Justice in the third Ito cabinet in 1898, and from then until 1900 was Minister of Agriculture and Commerce in the Yamagata cabinet. In 1902 he was elected to Parliament, of which

he became President. In 1909 he succeeded Prince Ito as Administrator of Korea.

**SONG** (AS. *song*, Ger. *Gesang*, from AS. *singan*, Ger. *singen*, to sing). A short lyric or narrative poem set to music in a way to reproduce the mood of the poem, the music also lending impassioned utterance to the words. The term "song" should properly be applied only to compositions for one or two voices with instrumental accompaniment. The art song (Kunstlied) was developed in Germany from the folk song. See **ARIA**; **BALLAD**; **FOLK MUSIC**; **LIED**; **MEISTERSINGER**; **MINNESINGER**; **MUSIC**; **HISTORY OF, XXV/II**; **NATIONAL HYMNS**; **ROMANCE**.

**SONG BIRDS**. The song birds of the world belong almost entirely to the order Oscines, which is that of the highest organization, and distinguished as a group by the possession of vocal organs of a specialized and peculiar sort. Yet all Oscines are not capable of singing, and some birds which utter melodious notes are to be found in other groups. The principal singers are to be found among the thrushes, wrens, warblers, pipits, larks, starlings, and in the great family of finches. These are largely birds of temperate climates, and the popular idea that the birds of the tropics are not singers has a basis in fact, though it is by no means true that no tropical birds utter melodious strains.

**SONG CELESTIAL**. See **BHAGAVAD-GITA**.

**SONGEESH**, sŏn-gĕsh', or **SONGISH**. A tribe of Salishan stock (q.v.) occupying a territory on the southeastern end of Vancouver Island, B. C. Their proper name is *Lkungen*, the other being a corruption of one of the subtribal names. Their general culture is that of the coast Salishan tribes. See **SALISHAN STOCK**.

**SONGHAY**, sŏn-gĭ', **SONRHAY**, or **SURHAY**. A Sudanese Nigritian people numbering 2,000,000, living in the bend of the Niger, below Timbuctoo, with separate speech. They are mixed at the north with Moors and at the south with Fulahs, and are Moslem.

**SONGISH**. See **SONGEESH**.

**SONG-KOI**, sŏng'koi'. A river of Indo-China. See **RED RIVER**.

**SONG OF DEGREES**. See **CRADUAL PSALM**.

**SONG OF IGOR'S BAND**. See **IGOR'S BAND**, **SONG OF**.

**SONG OF SOLOMON**. See **CANTICLES**.

**SONG SPARROW**. See **SPARROW**.

**SONG THRUSH**. Any of several thrushes locally conspicuous for their song. In the United States the wood thrush (q.v.) is most often the one meant. In Great Britain it is the thrush (*Turdus musicus* or, more correctly, *philomelus*) called "mavis" provincially, and often kept caged for the sake of its melody. It is a permanent resident of all temperate Europe, and in its ground hunting and hardy habits resembles its congener, the American robin; its nesting habits are similar, though it uses less mud and its blue eggs are spotted with brown. The adult male is dark brown above, tinted with golden brown; throat buff; underparts yellowish white, closely spotted with brown. It is a pleasing songster, and especially a favorite in Scotland and Scandinavia. See **THRUSH**.

**SONNAMBULA**, sŏn'nám-bŏŭ'lá, LA. An opera by Bellini (q.v.), first produced in Milan, March 6, 1831; in the United States, May 14, 1842 (New York).

**SONNEBERG**, zŏn'e-bĕrk. A town and summer resort in the Duchy of Saxe-Meiningen, Germany, on the Rŏthen, 13 miles northeast of

Coburg (Map: Prussia, D 3). Its principal industry is the manufacture of toys. Masks, grindstones, slates, and pencils are also manufactured. Pop., 1900, 13,317; 1910, 15,878.

**SONNECK**, OSCAR GEORGE THEODORE (1873- ). An American musical scholar and writer, born in Jersey City, N. J. When he was 10 years old he entered the Gymnasium at Kiel, completing the course in Frankfort. From 1893 to 1897 he attended the University of Munich, studying philosophy under Stumpf and the history of music under Sandberger. In 1898 he entered the conservatory at Sondershausen, where he studied chiefly conducting. After that he again spent some time at Frankfort, perfecting himself on the piano under Kwast and studying instrumentation under Knorr. After devoting a short time to research work in Italy he returned to the United States in 1899. In 1902 he was appointed librarian of the musical section of the Library of Congress at Washington, which under his administration became one of the great musical libraries of the world. Under his editorship the *Musical Quarterly*, published by G. Schirmer, New York, was established in 1914. His extensive and scholarly researches concerning early American music and musical life laid the first foundations of an authoritative history of American music. Among his numerous publications the most important are: *Francis Hopkinson and James Lyon: Two Studies in Early American Music* (1905); *Early Concert Life in America* (1907); *Early Opera in America* (1913); *A Survey of Music in America* (1913). Of the greatest value are also the descriptive catalogues published, under his direction, by the Library of Congress, especially those on *Dramatic Music* (1908), *Orchestral Music* (1912), *Early Books on Music* (1913), *Opera Librettos Printed before 1800* (1914).

**SONNENFELS**, zŏn'en-fĕls, JOSEPH VON (1732-1817). An Austrian author, of Jewish parentage, born in Nikolsburg, Moravia. After giving up his theological studies he served in the Austrian army in 1749-54, was then for a time a lawyer's clerk, and became particularly active in endeavors towards the improvement of the Vienna stage, in connection with which he wrote the *Briefe über die wienerische Schaubühne* (1768; new ed., 1884). His *Absehung der Tortur* (1775) effectively secured the abolition of the torture throughout Austrian domains. In 1763 he was appointed professor of political science in the University of Vienna, and subsequently received various posts, including that of president of the Academy of Fine Arts (1811). His collected writings appeared at Vienna in 13 volumes (1783-87). Consult the biography by Müller (Vienna, 1882).

**SONNENSCHNEID**, sŏn'nen-shĭn, EDWARD ADOLF (1851- ). An English classical scholar, brother of William S. Sonnenschein. He was born in London and was educated at University College, London, and University College, Oxford. He was assistant professor of humanity (Latin) at the University of Glasgow (1877-81), professor of Greek and Latin in Mason College, Birmingham (1883-1900), and professor of Latin and Greek at the University of Birmingham from 1900. His publications include numerous papers in the periodicals, Latin and Greek grammars, and annotated editions of plays of Plautus—the *Captivi* (published in 1879), the *Rudens* (1891, 1901), and the *Mostellaria* (2d ed., 1907).

**SONNENSCHN**, sŏn'nēn-shīn, WILLIAM SWAN (1855- ). An English publisher and compiler, brother of Edward A. Sonnenschne. He was born in London and was educated there at University College. In 1878 he established in London a publishing business which in 1895 became a limited company with himself as chairman. He collected an important library in bibliography and literary history and published *The Best Books* (1887; 5th ed., 1901), a classified list of about 50,000 available works, and *A Reader's Guide to Contemporary Literature* (1894; 2d ed., 1901), supplementary to the foregoing. Later these two were combined and brought down to date (2 vols., 3d ed., 1910-12), covering about 100,000 works. He also spent much time in preparing a *Dictionary of Phrases*.

**SONNENTHAL**, zŏn'en-tāl, ADOLF VON (1834-1909). An eminent Austrian actor, born in Budapest. He first worked as a journeyman tailor, but after some experience on the provincial stage was engaged at the Court Theatre in Vienna, where he was soon recognized as an actor of the first rank, excelling equally in tragic rôles and in comedy. In 1881 he was knighted by the Emperor. In 1885, on a visit to New York, he was most cordially received by the public. He visited the United States again in 1899 and 1902. Consult Eisenberg, *Adolf Sonnenthal* (Dresden, 1896).

**SONNET** (Fr. *sonnet*, song). As perfected by the Italians, a stanza of 14 hendecasyllabic verses. The stanza is divided into two unequal parts. The first part, called the octave, is composed of two quatrains (or four-line strophes). The second part, called the sestet, is composed of two tercets (or three-line strophes). The octave runs on two and the sestet on two or three rhymes. According to a common type, the rhymes are arranged thus: *abba, abba, cde, cde*. This rhyme scheme may vary considerably, especially in the sestet. The four divisions—particularly the octave and the sestet—are usually kept distinct in sense as well as in form. In this rigid metrical form the idea, mood, or sentiment of the poet is developed by stages. The sonnet was primitively a lyric sung with musical accompaniment. Indeed, in old Provençal and French the words *son* or *sonet* designated a lyric in the vernacular. It is now generally held that the sonnet originated in Sicily. Some philologists, however, find its germ in the Provençal *cobla esparsa*. Even Arabic origins have been suggested.

The sonnet, widely cultivated in Italy and Provence during the thirteenth century, assumed its highest art in Petrarch (1304-74). The form was also practiced by Lorenzo de' Medici, Michelangelo, and Tasso, and has always enjoyed great popularity in Italy. From Italy the vogue of the sonnet spread over western and northern Europe. In Spain it was naturalized by Juan Boscán (c.1493-c.1542). Portugal had the great Camões (q.v.). The form seems to have been introduced into France by Mellin de Saint-Gelais, and was at once adopted by his master Marot. It received an immense impulse from the Pléiade. Du Bellay produced nearly 200 sonnets, and Ronsard more than 900. In France the fashion, after declining in the eighteenth century, came in again with the Romantics. Among recent French adepts in the sonnet are Sully-Prudhomme and Hérédia.

The sonnet was introduced into England by the Earl of Surrey and Sir Thomas Wyatt. Their

collection, numbering 36 altogether, first appeared in Tottel's *Miscellany* under the title *Songes and Sonnetes* (1557). Between 1591 and 1597 were published, according to the conservative estimate of Sidney Lee, more than 2000 English sonnets. The Elizabethans did not follow strictly the Petrarchan type. Spenser and Shakespeare, though logically developing the idea, reduced the sonnet to three quatrains clinched by a final couplet. Shakespeare further simplified the sonnet by employing a distinct set of alternating rhymes in each quatrain. His rhyme scheme is *abab, cdcd, efef, gg*. After 1600 the sonnet impulse, though weakened, was still a force. Then came Milton, with his small but grand group. For a century after Milton few English sonnets were written, but with the Romantic revival the sonnet returned (about 1750), though even Wordsworth, as late as 1827, thought it necessary to defend the form against the critics. Among the great English poets of the nineteenth century who practiced this form are Wordsworth, Coleridge, Keats, Mrs. Browning, and the Rossettis. In America lyric poets from Poe to Thomas Bailey Aldrich wrote notable sonnets. Unsurpassed in this form was Longfellow, whose sonnet series on the *Divine Comedy* is of high excellence both in form and substance. In Germany, though sonnets appeared as early as the seventeenth century, with Weckherlin (1585-1653) and Opitz (1597-1639), they were not much cultivated till taken up by the Romantics and a few poets just preceding: Bürger, A. W. Schlegel, Arnim, Voss, Goethe, Rückert, Eichendorff, Heyse, Geibel, and Redwitz.

**Bibliography.** History and criticism: K. A. Lentzner, *Ueber das Sonett und seine Gestaltung in der englischen Dichtung bis Milton* (Halle, 1886); Leandro Biadene, "Morfologia del sonetto nei secoli 13 e 14," in *Studi di filologia romana*, vol. iv (Rome, 1889); Hiram Corson, *Primer of English Verse* (Boston, 1892); E. W. Olmstead, *The Sonnet in French Literature and the Development of the French Sonnet Form* (Ithaca, 1897), containing a bibliography; Hugues Vagany, *Le sonnet en Italie et en France au XVI<sup>e</sup> siècle* (Lyons, 1902); Max Jasinski, *Histoire du sonnet en France* (Douai, 1903); Sir Sidney Lee, "Elizabethan Sonnets," in Edward Arber (ed.), *English Garner* (New York, 1904); Theodor Fröberg, *Beiträge zur Geschichte des deutschen Sonetts im XIX. Jahrhundert* (Munich, 1904); P. E. More, "Elizabethan Sonnets" and "Shakespeare's Sonnets," in *Shelburne Essays*, second series (New York, 1907); Wilkins, "Invention of the Sonnet," in *Modern Philology*, vol. xiii (Chicago, 1915); Sir Sidney Lee, *Life of Shakespeare* (new ed., London, 1916), containing chapters on Italian, French, and English sonnets. Collections: Hunt and Lee, *Book of the Sonnet* (2 vols., Boston, 1867); T. Hall Caine, *Sonnets of Three Centuries* (London, 1882); Samuel Waddington, *Sonnets of Europe . . . Translations* (New York, 1886); William Sharp, *Sonnets of this Century, with a Critical Introduction on the Sonnet* (ib., 1887); C. H. Crandall, *Representative Sonnets by American Poets* (Boston, 1890); M. F. Crow, *Elizabethan Sonnet-Cycles* (4 vols., London, 1896-98); A. T. **SONNINO**, sŏn-nē'nŏ. A town in the Province of Rome, Italy, 64 miles southeast of the city of Rome. Its chief feature is the convent

of Fossanova, an exceptionally fine specimen of early Gothic architecture. Pop., 1911, 4915.

**SONNINO, SIDNEY, BARON (1847-1921).** An Italian statesman. He was born at Pisa, and he graduated LL.D. from the university there in 1865. In 1867-72 he was connected with the diplomatic service, and after 1880 was a deputy in the Italian Legislature. He served as Minister of Finance in 1893-94 and as Minister of the Treasury in 1894-96, and was Premier and Minister of the Interior in 1906 and in 1909-10. When Italy made preparations to enter the European War Baron Sonnino, though leader of the Opposition, accepted the portfolio of Foreign Affairs in the Salandra (q.v.) cabinet in December, 1914. He served as editor of the *Rassegna Settimanale* in 1878-82, and was author of *I contadini in Sicilia* (1876) and other works on social and political topics.

**SONORA, sô-nô-râ.** A state of northwest Mexico (Map: Mexico, D 3). Area, 76,619 square miles. Along the coast extends a low arid region rising gradually towards the interior. In the east rises the Sierra Madre with its numerous offshoots inclosing deep valleys. The rivers are few, the Yaqui being the most important. The climate differs considerably in the different parts of the state, but the rainfall is generally scanty and agriculture can be carried on only with irrigation. The mineral deposits of Sonora are among the richest in Mexico, the most important being of copper, gold, and silver. Mining is carried on extensively and a large proportion of the mineral products is exported to the United States. Sonora is crossed from north to south by a railway line which touches at Guaymas, the chief port. Pop., 1910, 265,383. Capital, Hermosillo (q.v.).

**SONORA, MARQUÉS DE LA.** See GÁLVEZ, JOSEPH.

**SONORAN REGION.** An American faunal region whose bounds are widely extended by some writers, but which may be restricted to the high and dry plateau region of the northern interior of Mexico and to the contiguous arid region of the southwest United States, reaching eastward into Texas and northward into Colorado, Utah, and Nevada between the mountain ranges. It is characterized by a large variety of small animals adapted to desert life, and has been studied and described by C. H. Merriam.

**SONGHAY.** See SONGHAY.

**SONS OF AMERICA.** See SECRET SOCIETIES, PATRIOTIC-POLITICAL.

**SONS OF LIBERTY.** The first secret society to appear in the United States, after the introduction of the Masonic Order. It had a loose organization and was found in all of the 13 Colonies, having come into existence as a political organization about 1764, at which time the Stamp Act aroused the opposition of its members. (See SECRET SOCIETIES, PATRIOTIC-POLITICAL.) The connection between the various societies of Sons of Liberty was mainly through correspondence. The name was used in reference to their activities by Col. Isaac Barré (q.v.), in Parliament at London, 1765, and the American organizations adopted the title at once. John Lamb (q.v.) and Isaac Sears (q.v.) were among the more active members of the Sons in New York. Paul Revere was a leader in New England. The society was active in supporting the nonimportation agreement, and also took part in the calling of the Continental Congress in 1774. After the Revolution the society died out,

many members helping to form or joining the then new Tammany Societies (q.v.). Consult: Leake, *Life of Gen. John Lamb* (Albany, 1850); Dawson, *Sons of Liberty in New York* (Poughkeepsie, 1859); also *The New Englander* (Boston, April, 1876).

**SONS OF THE AMERICAN REVOLUTION, NATIONAL SOCIETY OF THE.** A hereditary patriotic society organized in New York City on April 30, 1889, by representatives of the Society of the Sons of the Revolution, and of the Sons of Revolutionary Sires. The latter had been organized in San Francisco, Cal., on Oct. 22, 1875, and after April 30, 1889, became the California State Society of the Sons of the American Revolution. Membership is restricted to lineal descendants of an ancestor who rendered actual service in the cause of American independence, as an officer, soldier, seaman, marine, militiaman, or minuteman in the forces of the Continental Congress or of the several Colonies. The membership was about 13,000 in 1915. The National Society was incorporated by Act of Congress in 1906.

**SONS OF THE CLERGY MUSICAL FESTIVAL.** An annual musical festival held in St. Paul's Cathedral, London. It was first organized in 1698, the proceeds being devoted to the needs of the Sons of the Clergy Corporation. The Royal Society of Musicians for a long time supplied the orchestra.

**SONS OF THE REVOLUTION.** A patriotic hereditary society originally organized in New York City on Feb. 22, 1876, and reorganized on Dec. 4, 1883. It admits to membership any male lineal descendant from an ancestor who actively assisted in establishing American independence during the War of the Revolution between April 19, 1775, and April 19, 1783. This society has been specially active in marking historic localities with tablets, especially in New York City. Noteworthy among these monuments are the tablets commemorating the battle of Long Island and that marking the site of the battle of Harlem Heights. The statue of Nathan Hale in City Hall Park, New York, was also erected by this organization. The membership in 1915 was about 7000.

**SONS OF VETERANS.** A patriotic society organized in Philadelphia, Pa., on Sept. 29, 1879. It admits to membership lineal male descendants of honorably discharged soldiers, sailors, and marines who served in the Civil War. The insignia consists of a bronze bar on which are the words "Filii Veteranorum"; and pendent from this bar is a red, white, and blue ribbon attached to a medallion containing a monogram of the letters "S. V." in relief on a wreath over crossed cannons, surmounted by a spread eagle. Of similar character is an organization known as Daughters of Veterans, which admits to membership daughters of honorably discharged soldiers, sailors, and marines, and daughters of Sons of Veterans, who are fifteen years of age and upward. The membership in 1915 was about 55,000.

**SONS OF WAR VETERANS, SOCIETY OF.** A patriotic society founded in 1893, having for its objects to preserve and perpetuate the principles for which the Federal soldiers fought in the Civil War; to assist surviving veterans and their widows; and the mutual benefit and advancement of its members. It admits to membership any male lineal descendant of an honorably discharged Union soldier, sailor, or marine who

served during the Civil War for not less than six months, part of this at the front.

**SONSÓN**, sŏn-sŏn'. A town of the Department of Antioquia, Colombia, 110 miles northwest of Bogotá, on the Sonsón River, at an altitude of 8300 feet. In the vicinity are extensive mines of gold, silver, and salt. The industries include weaving of cotton and woolen mantles, and the manufacture of straw hats. Pop., 1912, 29,346.

**SONSONATE**, sŏn'sŏ-nă'tă. A town of Salvador, 32 miles west of San Salvador (Map: Central America, C 4). It is the capital of a department of the same name, and is regularly built. Pop. (est.), 13,000. It was founded in 1524 by Pedro de Alvarado.

**SONTAG**, zŏn'täg, **HENRIETTE** (1806-54). A German operatic soprano, born at Coblenz. She was engaged upon the stage from early childhood. In 1824 she sang at Leipzig in *Der Freischütz* and *Euryanthe*, in the latter creating the title rôle. Her success was immediate, and in 1824 she went to the Königstädter Theater, Berlin. Two years afterward she sang the part of Rosina in *Il Barbiere di Siviglia*, in which her coloratura power gave her a distinct triumph over Catalani. In 1827 she was engaged at the Paris Italian opera, and a year afterward married Count Rossi. She sang in all the musical centres of Europe, and in 1852 visited the United States. In 1854 she was engaged for the Italian opera in Mexico, but was stricken there with cholera and died. Consult W. Berger, *Berühmte Frauen* (Berlin, 1904).

**SONTHALS**. See **SANTALS**.

**SONYA**, sŏn'yă. See **KOVALESKY**, S. V.

**SOOCHÓW**, sŏŏ'chou'. A town of China. See **SUCHOW**.

**SOOTHSAYER**. See **MANTIS**.

**SOO TUNG-P'Ō**. See **SU TUNG-P'Ō**.

**SOOY SMITH**, WILLIAM (1830-1916). An American engineer. He graduated at Ohio State University (1849) and at West Point (1853). After serving in the artillery he resigned from the army in 1854 and became a civil engineer. In 1857 he made surveys for the first international bridge across the Niagara River. Subsequently he was connected with the Trenton Locomotive Works, but resigned in 1861 to re-enter the army. He became brigadier general of volunteers, serving in the Vicksburg campaign under Grant, and later in the Department of Tennessee under Sherman, but in 1864 was compelled to resign in consequence of illness. He returned to his profession, settling in Chicago, and in 1865 became actively engaged as engineer for various bridges and tunnels, including the bridge across the Missouri River at Glasgow, Mo., and the projected Hudson River Tunnel at New York. General Sooy Smith made many notable improvements in pneumatic processes for sinking foundations and in methods of construction of high buildings.

**SOPHIA**, sŏ'fē-ă. The capital of Bulgaria. See **SOFIA**.

**SOPHIA ALEX'EYEV'NA** (1657-1704). A regent of Russia, born at Moscow. She was the daughter of Czar Alexius I by his first wife. When her brother, Czar Theodore III, died in 1682, she incited a rebellion of the *stryeltsy* or musketeers, who murdered the supporters of the young Peter the Great. Sophia then declared herself Regent over her two half-brothers Ivan and Peter, and for seven years was the actual ruler of Russia. In 1689 Peter compelled

her to retire into a convent at Moscow, and after 1698 had her imprisoned under military surveillance. Consult R. N. Bain, *The First Romanovs* (London, 1905).

**SOPHIA DOROTHEA** (1666-1726). Consort of George I, King of England and Elector of Hanover. She was the heiress of Duke George William of Brunswick-Lüneburg-Celle, and married her cousin, the Crown Prince of Hanover, in 1682. She bore two children, who became King George II of England and Queen Sophia Dorothea of Prussia, mother of Frederick the Great. Her life at the Hanoverian court was made miserable by the intrigues of her father-in-law's mistress, the Countess von Platen, who accused her of a liaison with Count Philip Christopher von Königsmarek. The Count, a wealthy young Swedish nobleman, had been a page at court, and was then colonel of the guards at Hanover. One night as he left the Crown Princess's apartments he was set upon by four soldiers stationed to arrest him, and accidentally killed. The body was concealed and his disappearance remained a mystery. Soon afterward the Crown Princess was arrested, tried before a court appointed for the purpose, and her marriage annulled. She was then sent to the castle of Ahlden, where she was confined until her death, thirty-two years later. Her guilt or innocence has long been a matter of controversy. Consult W. H. Wilkins, *The Love of an Uncrowned Queen* (London, 1900). See **KÖNIGSMAREK**.

**SOPHIOLOGY** (from Gk. *σοφία*, *sophia*, wisdom, from *σοφός*, *sophos*, wise + *-λογία*, *-logia*, account). The science of philosophies. All peoples in every stage of development produce philosophies, or general systems of thought designed to explain the phenomena coming within their observation. To some extent these systems are the product of individual minds, yet each philosophy is in no small measure a collective product.

**SOPHISTS** (Lat. *sophista*, from Gk. *σοφιστής*, *sophistēs*, wise man). A class of thinkers and teachers who appeared in the fifth century B.C. in Greece, and especially at Athens. We have little information concerning them except such as has come from their opponents. We can perhaps form a fair estimate of the character and significance of their work if we remember that much of what is said of them in extant Greek writings is extravagant satire. The change of political institutions following the Persian and Carthaginian wars, the growth of democracy with an increasing opportunity for the orator, the distrust in the inviolable character of social rules, now seen to differ in various countries, all conspired to create a demand for instruction which should qualify men for life under new conditions. The Sophists arose to meet this demand. They popularized the results of the investigations of previous philosophers. Of the earlier Sophists some were Eleatic, some Heraclitean, some Pythagorean in their views, but they laid more emphasis on equipping their pupils for the tasks of public life than for philosophic or scientific work. Philological studies, rhetoric, and argumentation by which the worse could be made to appear the better reason, were their leading interests. In the history of philosophy their significance, apart from the fact that their activity called forth the philosophical activity of Socrates, and through him that of Plato and Aristotle, is mainly epistemological and ethical. The readiness with which all their ar-

guments were received by their listeners made them distrustful of human knowledge. They came to believe that any proposition could be proved as satisfactorily as any other. When every statement is demonstrable none can command absolute credence, and skepticism (q.v.) is the foregone conclusion. This skepticism found a theoretical confirmation in views then becoming current as to the origin of knowledge. Against the older rationalism (q.v.), which distinguished between sense and thought, Protagoras, the leading Sophist, maintained that sensations were the sole content of consciousness. But if this is true and if sense impressions of one and the same object vary, there is no court of appeal. One sensation is as good as another; everything is just what it appears at the moment. There is no ascertainable identity underlying differences of appearance. The unity of phenomena in their laws is lost sight of, and each individual man becomes the measure of the universe. Opposite conclusions have been drawn from this sensationalism. Gorgias argued that nothing is, for everything is full of contradictions. Euthydemus, conversely, denied that there can be contradiction. If subject and predicate mean different things, then what seems to be contradiction is mere difference. Lycophon went so far as to advise the omission of the copula in propositions, presumably because all judgments are supposed to be mere unrelated sequences of words. In ethics the upshot of the sophistic teaching was an ultraindividualism with consequent license in practical life. Everything institutional and social came to be regarded as conventional, with nothing natural left except unscrupulous self-seeking. Protagoras recognized the originality of justice and of regard for social approval (*αἰδώς*). But other Sophists were not so conservative. Callicles, in Plato, is made to say that all laws are created by the strong and enforced on the weak, while Thrasymachus contends that no man but a fool is willingly just. It is obvious that where the whole of morality is brushed aside as a trick whereby the strong make the weak do their will, religion cannot stand untouched. Protagoras prudently claimed that he knew nothing about the gods, while his successors ran the whole gamut from skepticism to avowed atheism.

It is interesting to note the unanimity with which Socrates, Plato, and Aristotle condemned the Sophists for accepting pay for their teaching. The truth was that by many of the Sophists learning was prostituted; and yet no universal condemnation may properly be passed on the Sophists as a class, as was done by modern historians till the appearance of Hegel's *History of Philosophy*. On the other hand, Grote in his *History of Greece*, vol. viii, has gone to the other extreme and has failed to appreciate the subversive tendency of much of the sophistic activity. Among the Sophists are to be mentioned Protagoras, Gorgias, Prodicus, Hippias, Polus, Thrasymachus, Euthydemus, Dionysodorus, Callicles, and Antiphon. Consult: Martin Schanz, *Die Sophisten* (Göttingen, 1867); Henry Sidgwick, in *Journal of Philology*, vols. iv and v (Cambridge, 1872-74); George Grote, *History of Greece* (new ed., 10 vols., New York, 1899); F. C. S. Schiller, *Plato or Protagoras?* (London, 1908); A. W. Benn, *Early Greek Philosophy* (New York, 1909), and the histories of philosophy by Ueberweg-Heinze, Windelband, Erdmann, Zeller, Gomperz, Benn, and Burnet.

**SOPHOCLES**, *sōf'ō-klēz* (Lat., from Gk. Σοφοκλῆς, *Sophoklēs*) (c.496-406 B.C.). An Athenian dramatist, born of a prosperous family, at Colonus, a beautiful suburb of Athens. His long and happy life coincided with the period of the Imperial greatness of Athens. His dramas are the most perfect examples of Attic art. His statue in the Lateran is the ideal type of Greek manhood. At the celebration of the victory of Salamis (480 B.C.) he was selected to lead the chorus of youths. His grace and youthful beauty in the rôle of the Princess Nausicaa playing ball with her attendant maidens were long remembered. He served also as the model of the painter Polygnotus for his ideal picture of the bard Thamyris. He composed the music of his beautiful choric odes, and in addition to his plays wrote many poems, including a Pæan to Æsculapius, which was still sung in the third century A.D. He served his country as ambassador, treasurer of the tribute, and general. He was noted for his piety, held a minor priesthood in his old age, and was worshiped with heroic honors after death. He was the friend of Herodotus (q.v.) who wrote an ode in his honor, and the associate and colleague of Pericles (q.v.).

In 468, at the age of 28, he produced his earliest play, the *Triptolemus*, which won the first prize against the veteran Æschylus (q.v.). For the remaining years of Æschylus' life the two mighty rivals contended, with varying success, each learning much from the art of the other. The first recorded contest with Euripides occurred in 438, when the younger poet's *Alcestis* won the second place. In the contests of the next 32 years Sophocles was generally successful, receiving first prize about 20 times and never falling below second place.

In 440 he was elected one of the board of generals for the Samian War, according to the legend, because of the popularity or political wisdom of the *Antigone*. The great poet as general was the theme of many anecdotes, some of which have been preserved by the writer of memoirs, Ion of Chios, who met him in Chian society. His old age is said to have been clouded by the attempt of his son, Iophon, to deprive him of the management of his estate on the ground of mental incapacity. The legend adds that Sophocles refuted the charge by reading to the jurors the magnificent chorus in praise of Colonus from the *Edipus at Colonus*, his latest play, produced after his death by his grandson and namesake. If the tale is true it is strange that Aristophanes makes no allusion to it in the *Frogs* (405 B.C.). There the relations between father and son are so friendly that Dionysus is unwilling to bring back Sophocles to the upper world until he has had an opportunity to test Iophon's poetic powers when unaided by his father. On the death of Euripides in the spring of 406 Sophocles assumed mourning and ordered his chorus to appear without wreaths. A few months later he followed his younger rival.

The chief changes in the external form of tragedy attributed to Sophocles are the raising of the number of members of the chorus from 12 to 15 and the introduction of a third actor, which made possible the complication of the action and the more effective portrayal of character by contrast and juxtaposition. He also abandoned the Æschylean fashion of composing plays in groups of three about a central myth or motive and made each play an independent psychological and dramatic unity. The chorus

participates very slightly if at all in the plot, and the length of the choric odes relatively to the dialogue diminishes, though they never become mere musical interludes, as is too often the case in Euripides. The Sophoclean chorus is the ideal spectator and interpreter of the ethical and religious significance of the action. The great choric odes of the *Antigone* and the *Œdipus* unite the grace of the Greek lyric to the moral earnestness of the Hebrew psalm.

Sophocles composed about 120 plays, of which seven are preserved, together with fragments of 80 or 90 others. (1) *Ajax*. Ajax, brooding upon the dishonor done him by the awarding of the arms of Achilles to Odysseus, is bereft of his reason by Athena, whom he has offended by presumptuous speech. In his frenzy he wreaks his wrath upon the cattle of the Greeks, thinking that he is exacting vengeance from the Greek chieftains. At this point the action begins. Awakening to the intolerable humiliation of his position, he slays himself after a touching farewell to his infant son and a noble apostrophe to earth and sea and sky. The debate on the question of granting him honorable burial, which fills the last third of the play, is an anticlimax to modern feeling, but effectively displays the conciliatory temper of the sagacious Odysseus and the vindictive spirit of Menelaus. (2) The *Antigone*, perhaps the first problem play in literature, presents the moral antinomy that arises from a conflict between political authority and the law of the individual conscience. Antigone, in obedience to Greek religious feeling and the dictates of her woman's heart, bestows the rites of burial upon her rebel brother Polynices in defiance of the edict of King Creon, and so brings about her own death, and, by tragic complication, that of her lover, Hæmon, the King's son, and that of Eurydice, Creon's wife. (3) The *Electra* corresponds to the middle play of Æschylus' trilogy, the *Oresteia*, and to the *Electra* of Euripides. It treats the slaying of Clytemnestra and her paramour, Ægisthus, by her children, Orestes and Electra, to avenge the murder of their father, Agamemnon. The psychological interest centres in the character of Electra, a sort of ancient Colomba, nerving her brother to the prosecution of the blood feud. (4) The *Œdipus Tyrannus* is the most ingeniously constructed of Greek plays and a typical example of the so-called Sophoclean or dramatic irony. The plot turns on the gradual inevitable revelation to Œdipus (q.v.), through his own insistent inquiry, of the dreadful truth, already known to the audience, that he has unwittingly fulfilled the oracle which doomed him to slay his father and live in incestuous marriage with his mother. (5) The *Trachinîæ*, named from the Trachinian maidens of the chorus, treats the poisoning of Hercules by the Nessus robe sent to him as a love charm by his jealous wife, Deianira, and his translation to heaven from the funeral pyre on Mount Œta. (6) The *Philoctetes* was produced in 409. Philoctetes, bitten by a serpent and afflicted with a disgusting wound, had been abandoned by the Greeks on the desert shore of Lemnos. After many years an oracle declares that he, the possessor of the bow of Hercules, is indispensable to the besiegers of Troy. Odysseus and Neoptolemus, the son of Achilles, are sent to fetch him, if need be against his will. Very beautiful are the descriptions of nature and the account of Philoctetes' lonely life. But the chief interest of the play

lies in the psychological study of the final revolt of the frank nature of Neoptolemus against the treachery which Odysseus requires him to practice upon the unsuspecting Philoctetes. (7) The *Œdipus at Colonus* (first produced in 401) depicts the reconciliation of Œdipus with destiny and his sublime and mysterious death at Colonus after years of wandering as a blind exile, sustained by the loving tendance of his daughter, Antigone.

As a poet Sophocles cannot vie in imaginative sublimity with Æschylus. As a thinker he may be less fertile in suggestion than the ingenious Euripides. But regarded as a Greek artist, shaping Greek legends in the conventional molds of Attic tragedy, he holds the just and perfect mean between the titanic symbolism of the older poet and the sentimental, rhetorical realism of the younger. He is reported to have said that Æschylus did right without knowing it, and that Euripides painted men as they are, while he himself represented them as they ought to be. A slight plot suffices him for the creation of a masterpiece because his subtle dramatic art and his exhaustive psychological analysis elicit from a simple situation a complete revelation of character and destiny. Fate, the prime motive of ancient tragedy, is no longer felt as a capricious external power, but as the inevitable outcome of character and the unavoidable condition of life. Tragic pathos is refined to a sense of the universal human fellowship in frailty and suffering. And beauty, the all-pervading, gracious serenity of an unailing and unobtrusive art, takes from pathos and tragedy their sting. Sophocles is the most truly Hellenic of the Greek tragedians, and for those who have drunk deeply of the Hellenic spirit the most human too.

The best edition is that of R. C. Jebb, in seven volumes, with elaborate introductions and commentary and English translation facing the Greek (Cambridge, 1881-96). There is a good annotated edition by L. Campbell (Oxford, 1871-81), and an excellent monograph by the same author. Plumptre's verse translation (1870) is much esteemed. That of Whitelaw (1883) is perhaps better.

**Bibliography.** R. C. Jebb, *The Growth and Influence of Classical Greek Poetry* (Boston, 1894); Gilbert Murray, *A History of Ancient Greek Literature* (New York, 1897); A. and M. Croiset, *An Abridged History of Greek Literature* (ib., 1904); W. C. Wright, *A Short History of Greek Literature* (ib., 1907); James Adam, *The Religious Teachers of Greece* (2d ed., Edinburgh, 1909); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913); and the article "Sophokles" in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914). See Plate of GREEK ART.

**SOPHOCLES**, EVANGELINUS APOSTOLIDES (1807-83). A Greek American classical scholar, born at Tsangaranda, near Mount Pelion, in Thessaly. He received his earlier education at the convent on Mount Sinai. In 1829 he emigrated to the United States and continued his studies at Amherst College. He was tutor at Harvard College, with a short intermission, from 1842 to 1849. In 1849 he was appointed assistant professor of Greek, and in 1860 professor of Ancient, Byzantine, and Modern Greek. His publications include, in addition to several textbooks: *Catalogue of Greek Verbs* (1844); *History of the Greek Alphabet* (1848); *Glossary of*

*Later and Byzantine Greek* (1860), revised and published under the title *Greek Lexicon of the Roman and Byzantine Periods* (1870; new ed., 1914).

**SOPHONISBA** (Lat., from Gk. Σοφόνισσα). The daughter of the Carthaginian Hasdrubal, son of Gisco. Her father promised her in marriage to the Numidian prince Masinissa (q.v.), but subsequently gave her to Masinissa's rival, Syphax (q.v.). When Masinissa in the Second Punic War overthrew Syphax, Sophonisba fell into his hands and he soon made her his wife, to the displeasure of Scipio, who insisted that he should surrender her. To save her from captivity, her husband sent her poison, with which she ended her life. Her history forms the theme of many tragedies, among them, in English, those by Thomson (1729), Nathaniel Lee (*Sophonisba, or Hannibal's Overthrow*, 1676), Marston (*Sophonisba, or The Wonder of Women*, 1602); in French, under the title *Sophonisbe*, by Mairet (1630) and by Corneille (1663); in Italian, as *Sofonisba*, by G. del Carretto (1502), Trissino (1529), and Alfieri (1783).

**SOPHRON** (Lat., from Gk. Σόφρων) **OF SYRACUSE** (460-420 B.C.). A Greek writer of mimes. Though from time immemorial the Greeks of Sicily had practiced the mimes at their public festivals (see **MIME**), Sophron was the first to reduce them to the form of a literary composition. They consisted in the representation of scenes from actual life in Sicily, chiefly in the lower classes, brought out by a dramatic dialogue, interspersed with numerous colloquial forms of speech. These pieces of Sophron, which were in the Doric-Greek dialect and in a kind of cadenced prose, were great favorites with Plato, who made use of them for the dramatic form of his dialogues (Quint., i, 10, 17; Diog. Laert., iii, 13). It is said that Theocritus borrowed his second and fifteenth idyls from Sophron. Very unsatisfactory fragments have been preserved. Consult Botzon's collection (Marienburg, 1867) and his *De Sophrone et Xenarcho Mimographis* (Lyck, 1856); also Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

**SOPORIFICS**, sŏ'pŏ-rif'iks or sŏp'ŏ. See **NARCOTICS**.

**SOPRANO**, sŏ-prŭ'nŏ (It., treble, high, supreme). The highest species of female voice, whose range normally extends from c<sup>1</sup> to a<sup>2</sup>.

With the exception of those at either extremity, all the tones are common to both the head and chest registers. A voice sometimes distinguished as intermediate between alto and soprano is the *mezzo-soprano*. See **MEZZO**. For soprano clef, see **MUSICAL NOTATION, The Clefs**.

**SORÀ**. A city in the Province of Caserta, Italy, on the Garigliano, 62 miles east-southeast of Rome (Map: Italy, D 4). The river is here spanned by two bridges. There are remains of walls and castle ruins above the town. It manufactures woolen cloth and paper and trades in wine, oil, fruits, and cattle. Sora, originally a Volscian town, was colonized by the Romans in 303 B.C. Pop. (commune), 1901, 16,001; 1911, 16,245 (town, 6050).

**SORA**. A small rail (q.v.); especially, in the Middle States, the Carolina rail (*Porzana carolina*), very abundant in the marshes of the Atlantic coast at early autumn, giving fine sport and good eating. It is eight or nine inches long, olive brown above varied with black and white, and beneath (in the fall) plain brownish. In

breeding plumage the face and throat are black, other underparts slate-gray. The sora breeds from the Middle States northward to Hudson Bay, and winters from the Carolinas southward to South America. The nest is of grass on the ground in swamps; the eight to 15 eggs are buffy, brown-spotted. See Plate of **RAILS**, ETC.

**SORANUS**. A Greek physician, who flourished c.110-130. He was born at Ephesus, but practiced at Alexandria and at Rome. Two of his medical treatises are extant in part, *On Fractures* and *On Diseases of Women*. The former may be found in T. L. Ideler, *Physici et Medici Minores*, vol. i (1841); the latter was edited by V. Rose (1882), with a translation into Latin, made by a physician named Moschio, in the sixth century. His chief work, *On Acute and Chronic Diseases*, exists now only in a Latin translation by Caelius Aurelianus. He wrote also *Lives of Physicians*, one of which, the *Life of Hippocrates*, still extant, is our chief authority for the life of Hippocrates. Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913), and Fr. Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

**SORATA**, sŏ-rŭ'tŭ, or ILLAMPU. The highest mountain of Bolivia and one of the highest of South America (Map: Brazil). It is situated in the Bolivian Department of La Paz, about 16 miles east of Lake Titicaca, and reaches an altitude of 21,500 feet. It was first ascended by Sir William Martin Conway in 1898.

**SORAU**, zŏ'rou. A town in the Province of Brandenburg, Prussia, on the Sorebach, 60 miles south-southeast of Frankfurt-on-the-Oder (Map: Germany, F 3). It has an old castle (now a prison) and a new castle (the seat of the magistracy). There are important bleach fields, print works, color works, iron foundries, and manufacturing of cloth, machinery, glass, porcelain, tubing, wooden shoes, and glazed bricks. Deposits of lignite are near. Sorau, the oldest town of Lusatia, received municipal privileges in 1260. It was ceded by Saxony to Prussia in 1815. Pop., 1900, 15,945; 1910, 18,019.

**SORAUER**, zŏ'rou-er, PAUL (1839-1916). A German botanist, born at Breslau and educated at the University of Berlin. In 1871 he became director of the experiment station at the Proskau Pomological Institute, and in 1892 he was made professor. In 1893 he went to Berlin as secretary of the International Phytopathological Commission. He became distinguished for his investigations in the diseases of plants, and founded the *Zeitschrift für Pflanzenkrankheiten* (Stuttgart), besides publishing: *Das Handbuch der Pflanzenkrankheiten* (1886; 3d ed., with Lindau and Reh, 1905-13; Eng. trans., *Manual of Plant Diseases*, 3 vols., 1915 et seq.); *Die Obstbaumkrankheiten* (1879); *Die Schäden der einheimischen Kulturpflanzen durch Schmarotzer, etc.* (1888); *Populäre Pflanzenphysiologie* (1891; Eng. trans., *Popular Treatise on the Physiology of Plants*, 1895); *Pflanzenschutz* (with Frank, 1896; 5th ed., with Rörig, 1910).

**SORB**. See **SERVICE BERRY**.

**SORBITE**, sŏr'bīt. See **MANNITE**; **METALLOGRAPHY**, *Heat Treatment*.

**SORBONNE**, sŏr'bŏn', LA. An institution of learning in Paris, founded by Robert de Sorbon. He was born Oct. 9, 1201, in Sorbon, near Rethel, not far from Rheims. Even to the present day the place name of this man has been attached to the focus of intellectual activity in France.

Robert de Sorbon studied in Paris, looking forward to the priesthood. He became priest, doctor of theology, and canon, first in the cathedral of Cambrai, then in that of Paris. By his eloquence and piety he won renown and was made chaplain, and perhaps confessor to King Louis IX (Saint Louis). Impressed by the importance of the theological science and by the necessities of poor young men who might need support while engaged in its study, De Sorbon established a society of secular ecclesiastics. The King and some ecclesiastical dignities favored this enterprise; and in 1257 a site was secured by royal bounty for the home of the society. It was near the Palais des Thermes, in the heart of the present Latin Quarter. There were other similar associations or colleges, but this was destined to perpetuity and distinction. The founder called the establishment *La Communauté des pauvres maîtres étudiant en théologie*; but the public shortened this phrase, and before the close of the century the college was called, from its founder's name, La Sorbonne, which it has borne to the present day. Its Latin title was Domus Sorbonnæ. The house was a hall of residence and of study, not a place for systematic instruction and lectures. For the work of Robert papal approbation was secured in 1268. Several years later, to this theological seminary the founder added a college for the humanities and philosophy, and he died soon afterward, at Paris, 73 years old (1274).

His life is full of interest and is told in Jadart's memoir, published at Rheims, in 1880. The principal incidents are well presented in the *Biographie générale*, and by Baroux in *La grande cyclopédie* (vol. xxx). The early muniments of this foundation may be found in Denifle's compendium of *Documents relatifs à l'Université de Paris* (Paris, 1883) and in the *Cartularium Universitatis Parisiensis*, vol. i (ib., 1899).

From its origin the Sorbonne has been the centre of intellectual activity, and until the French Revolution it was recognized as especially the seat of theological learning. The faculty pronounced their opinions on important questions and their decisions were authoritative. The reader need only consult the *History of France* by Henri Martin to discover illustrations of this. The faculty intervened in the trial of Jeanne d'Arc; it condemned the views of Luther and showed hostility towards reformers; censured many noteworthy books and writers; opposed the Cartesian philosophy; and addressed the Czar in regard to a reunion of the Greek and Latin churches. Among books condemned were the treatise of Helvetius, *De l'Esprit*, the fourth volume of Buffon's *Natural History*, and Rousseau's *Emile*. Among the glories of the Sorbonne was its encouragement of printing in France, by giving quarters for their presses to Ulric Gering and other early printers.

The buildings of the Sorbonne were reconstructed early in the seventeenth century by Richelieu, who merits the distinction of a second founder. The church which he built as the college chapel is one of the celebrated monuments of ecclesiastical architecture in Paris. His tomb is there, not far from that of Robert de Sorbon. The Sorbonne was given to Paris in the middle of the nineteenth century, and a magnificent building was erected for the departments of science and letters. This edifice, called La Nouvelle Sorbonne, was completed in 1889, and it

is perhaps the finest university building in the world. Its lecture rooms and laboratories are well equipped, and the mural decorations (especially the great picture by Puvis de Chavannes) are of rare beauty. In the transition from the old to the new Sorbonne M. Gréard published a noteworthy pamphlet, entitled *Nos adieux à la vieille Sorbonne*.

Changes in the interior administration due to the progress of science and to the increase of funds are too complex for presentation here. The most radical are the disappearance, after the French Revolution, of the Faculty of Theology, once the sole authority, so that a Sorbonnist was of course a theologian; the consequent supremacy of literature and science, evinced by the organization of the Ecole des Hautes Etudes, and by the founding of libraries and seminaries; also by the establishment, in the immediate neighborhood, of schools of medicine and law. The faculties of science and letters of the University of Paris are installed in the New Sorbonne and *Minerva* for 1913-14 reports that their libraries contained 600,000 volumes.

At a recent date, connected more or less closely with the New Sorbonne, there were 5000 students, 100 professorships, and many accessory positions for associates and assistants. Consult: A. L. A. Franklin, *La Sorbonne: ses origines, sa bibliothèque*, etc. (2d ed., Paris, 1875); Hastings Rashdall, *Universities of Europe in the Middle Ages* (Oxford, 1895); Pierre Leguay, *La Sorbonne* (Paris, 1910); Agathon (pseud.), *L'Esprit de la nouvelle Sorbonne* (3d ed., ib., 1911).

**SORBS**, or **SORBIANS**, sôr'bi-anz. See **WENDS**.

**SORBY**, sôr'bi, HENRY CLIFTON (1826-1908). An English geologist. Born at Woodbourne near Sheffield, he was educated privately, and afterward devoted himself to independent investigations in biology, geology, and archaeology. He was the originator of microscopic petrology, but at first his work in this field received scant recognition. He was elected F. R. S. in 1857, and in the following year his great paper "On the Microscopic Structure of Crystals" appeared in the *Quarterly Journal* of the Geological Society. Sorby was president of the Royal Microscopical Society and of the geological section of the British Association in 1880.

**SORCERY**. See **WITCHCRAFT**.

**SORDELLO**. An Italian troubadour of the thirteenth century who wrote in Provençal. He was a native of Goito, Mantua. The earliest mention of him has reference to a tavern brawl, which took place about 1220 at Florence, and the last document in which his name appears is dated 1269. While living at the court of Richard of San Bonifazio he carried off his master's wife, Cunizza, at the instigation of her brother, Ezzolino de Romano. Soon afterward he fled to Provence, where, with the exception of visits to Spain and Portugal, he seems to have spent the greater part of his life. Here he took part in important public events, his name appearing as that of a witness in various treaties and other documents. In his old age he returned to Italy as a knight in the train of Charles of Anjou, on his Naples expedition (1265), and received from him several castles in the Abruzzi as a reward for his services. In 1266 he was a prisoner in Naples. He died in Provence. As a poet he rises little above mediocrity. His political, moral, and personal sir-

ventes show vigor and spirit, but his love songs are purely conventional, and his didactic poem *Documentum Honoris* has no unusual merit. His reputation depends upon Dante's treatment of him in *Purgatorio*, vi and vii, where he is represented as a type of high-minded patriotism. This conception is founded upon a sirvente (1237) on the death of Blacatz, in which Sordello imagines his patron's heart divided among the various princes who need its virtues, being wholly forgetful of their country in their selfish squabbles. Dante has put into the mouth of his shade in *Purgatory* a similar invective as well as a magnificent apostrophe to Italy. Robert Browning's poem *Sordello* has but the slightest historical foundation. Consult: Cesare de Lollis, *Vita e poesie di Sordello di Goito* (Halle, 1896); V. Crescini, *Sordello* (Verona, 1897); J. H. Chaytor, *Troubadours of Dante* (Oxford, 1902).

**SORDINO**, sôr-dě'nô. See MUTE.

**SORE**. See ULCER.

**SOREL**, sô-rêl'. A city and the capital of Richelieu County, Quebec, Canada, on the Richelieu River at its mouth in Lake St. Peter, and on the Quebec, Montreal, and Southern, and the Canadian Pacific railways, 45 miles northeast of Montreal (Map: Quebec, G 5). It has large shipbuilding and manufacturing interests. Pop., 1901, 7057; 1911, 8420.

**SOREL**. A river of Canada. See RICHELIEU.

**SOREL**, AGNES. See AGNES SOREL.

**SOREL**, ALBERT (1842-1906). A French historian, born at Honfleur. He became professor of diplomatic history in the School of Political Sciences at Paris in 1872. He was a disciple of Taine (q.v.), whom he succeeded (1896) as a member of the French Academy. Some of his works are *La grande faiblesse* (1871); *Histoire diplomatique de la guerre franco-allemande* (1875); *La question d'Orient au XVIII<sup>e</sup> siècle* (1878); *Montesquieu* (1887); *Madame de Staël* (1890), in the "Grands Ecrivains Series"; *Bonaparte et Hoche en 1797* (1896); *Etudes de littérature et d'histoire* (1901). His masterpiece is *L'Europe et la révolution française* (1885-1904). Shortly before his death he was awarded the Osiris prize of 100,000 francs, offered for the first time by the French Institute.

**SOREL**, CHARLES (c.1599-1674). A French burlesque romancer, of whose life little is known. In 1622 appeared anonymously his picaresque novel, *Histoire comique de Francion*, first in seven, later (1641) in eleven books. This work, reprinted more than 40 times in the seventeenth century, made merry with the pastoral and chivalric romances then so popular. In *Le berger extravagant* (1621), an imitation of *Don Quixote*, Sorel likewise mocked the "ideal" romance. His *Polyandre* (incomplete, 1648) portrays the well-to-do Parisian bourgeoisie with some accuracy. Consult Körting, *Geschichte des französischen Romäns in XVII. Jahrhundert* (Leipzig, 1885), and Roy, *La vie et les œuvres de Charles Sorel* (Paris, 1853).

**SOREL**, GEORGES (1847- ). A French writer on syndicalism (q.v.), born at Cherbourg. He attended the Ecole Polytechnique in 1865-67, became an engineer in the service of the Department of Bridges and Highways, and in 1892, having been decorated with the Cross of the Legion of Honor and become chief engineer, he resigned from the service of the state. Thereafter he contributed to the *Devenir Social* (1895-97), which he had founded with Lafargue,

Deville, and Bonnet, to *Le Mouvement Socialiste* (1899 and 1906-08), to *Il Devenir Sociale* after 1905, and to other periodicals. Through his numerous writings in these journals Sorel became recognized as the chief philosopher of the Syndicalist movement. His publications include: *Le procès de Socrate* (1889); *L'Avenir socialiste des syndicats* (1900); *Introduction à l'économie moderne* (1903; 3d ed., 1911); *Saggi di critica del Marxismo* (1903; Ital. trans., 1903); *Les illusions du progrès* (2d ed., 1911); *Réflexion sur la violence* (1909; Eng. trans. by T. E. Hulme as *Reflections on Violence*, 1912; new ed., 1915), this latter work being his most important. Consult Giuseppe Prezzolini, *La teoria sindacalista* (Naples, 1909), and Agostino Lanzillo, *Giorgio Sorel, con una lettura autobiografica* (Rome, 1910).

**SORE MOUTH**, INFANTILE. See THRUSH.

**SORE NIPPLES**. See MAMMARY GLAND, DISEASES OF.

**SORGHUM** (Neo-Lat. *sorghum*, Indian millet, sorghum, probably of Oriental origin), *Sorghum vulgare* or *Andropogon sorghum*, var. *saccharatus*. A tall, earless, maize-like grass with a terminal head of small seeds. It is supposed to be a native of Africa, but has long been cultivated in southern Europe and China as a forage plant (see below), and for the sirup made from its sweet juice, which does not yield a profitable quantity of sugar. See SUGAR, *Manufacture*.

The nonsaccharine sorghums constitute a group of varieties deficient in sugar. The plants, which are very leafy, grow from 4 to 8 feet high and are cultivated for food and forage. All varieties are closely allied and belong to the above-named species. The most common varieties are Kafir corn, Milo maize, durra, Egyptian rice corn, Jerusalem corn, and broom corn (q.v.). They are extensively grown in Africa, India, and China for the seed, which forms a staple human food. In Europe they are sometimes planted, but they do not ripen seed in regions remote from the Mediterranean. In the United States they are grown for forage in the semiarid Western States, where, owing to drought-resisting qualities, they have become important crops. Soil, climatic requirements, and cultural methods are practically the same for all varieties. Kafir corn, the most important variety for the American farmer, was introduced by the United States Department of Agriculture about 1885 and widely distributed. It has become a valuable and important crop in California, Kansas, and Oklahoma. It succeeds on many soils, but best returns are obtained on rich soils suitable for corn. Profitable yields, however, are often obtained on land too poor for corn. The preparation of the soil consists in deep plowing and fine surface pulverization to insure best conditions for the young plants, which are at first feeble and slow to grow. The seed is sown broadcast, in hills or drills after the soil becomes warm. When grown in hills or drills it is treated like corn, when sown broadcast like hay crops. When the grain is ripe the plants are cut by hand or with a corn harvester, put up in shocks, and left to cure. When curing is complete the heads are threshed for the seed and the stalks and leaves used as fodder. Frequently the entire plants are used for feeding. From 25 to 50 bushels of seed per acre and from 5 to 10 tons of fodder are obtained under ordinarily favorable conditions. Milo maize requires a longer season

of growth than Kafir corn, and is therefore more liable to injury by frost in many localities. Durra, also sometimes called Egyptian corn, grows vigorously, sending out profuse stolons. The heads are heavy, short, and thick, and hang downward from a short curve in the upper part of the stalk. The name is often written dhoura or doura. Egyptian rice corn differs from other varieties in stooling little and having a smaller amount of foliage. The seeds are white, large, and sweet. Jerusalem corn produces heavy yields of grain. Its seeds are nearly free from husk and shatter easily. None of these varieties are materially affected by either plant diseases or insects. See SMUT.

The *saccharine sorghums* are favorably regarded for sirup production, for silage and soiling purposes, and for forage. Growing animals thrive upon them, and dairy cattle produce an increased flow of milk. The bagasse or refuse from the press in sirup making is also fed advantageously. According to experiments 40 per cent of the protein, 71 per cent of the nitrogen-free extract, and 42 per cent of the crude fibre of sorghum forage is digestible. About 15,000,000 gallons of sorghum sirup are produced in the United States annually.

The average composition of sorghum products follows:

AVERAGE COMPOSITION OF SORGHUM PRODUCTS

PRODUCT	Water	Protein	Fat	Nitrogen free extract	Crude fibre	Ash
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Whole plant fresh .....	72.7	1.4	1.7	15.2	7.4	1.0
Whole plant cured.....	43.6	3.9	3.3	25.8	20.2	3/2
Sorghum silage .....	75.5	1.5	1.2	11.9	8.0	1.9
Sorghum seed .....	12.8	9.2	3.4	70.8	2.6	2.1
Sorghum bagasse.....	11.3	3.4	1.4	50.5	30.5	2.9

Although sorghum furnishes excellent pasture for all stock, it is especially valuable for sheep and pigs, but until the animals become accustomed to it they should have only small amounts. It is best adapted for fall and early winter feeding, since it does not keep as well as many other coarse fodders. Sorghum silage has a greater tendency to develop acidity than corn. When in good condition it is an excellent feeding stuff. The seed is a concentrated feed, and quite similar in composition to shelled corn, though regarded as somewhat inferior in feeding value. When sorghum is grown for making sirup the seed heads are often fed whole; otherwise they are frequently left on the stalk and fed as forage. It is believed that grinding increases the digestibility of the seed. Since Kafir corn is the most important nonsaccharine sorghum, and since other varieties resemble it, it is taken as a type of the group. See table.

as the plant ripens there is a decrease in albuminoids, but an increase in percentage of other constituents and in total weight of the seed. It is believed, therefore, that the best time to harvest Kafir corn is when the crop is ripe or nearly so. The stover, with practically the same feeding value as corn stover, should be run through a cutting machine to obtain best results. It has been found an excellent coarse fodder for cattle. The seeds have also given very satisfactory results, though it has not been found in tests at the experiment stations to be quite equal to corn, as is sometimes asserted. To obtain the best results the grain should be ground, as otherwise the small hard seeds are not thoroughly masticated and pass through the animal undigested. According to the Kansas Experiment Station, a bushel of Kafir corn will produce 10 pounds of pork, a bushel of corn 12 pounds, an acre of the former, however, producing more pork than an acre of the latter. Animals tire of Kafir corn alone more quickly than of corn alone. Digestion experiments with chickens have shown that about 88 per cent of the total organic matter, 53 per cent of the protein, and 96 per cent of the nitrogen-free extract of whole Kafir corn is digestible. Similar values have been obtained for the ground grain. In experiments with Kafir corn stover fed to sheep

about 42 per cent of the protein, 67 per cent of the nitrogen-free extract, and 54 per cent of the crude fibre was digested.

Flour, which is said to be especially good for pancakes and has also been used for bread, is ground from Kafir corn, which is, however, not extensively used as food in the United States. The seeds of the closely related durra are much eaten by the Abyssinian and other African races, and those of other nonsaccharine sorghums in India and China. Kafir corn flour or meal has the following percentage composition: Water, 16.8; protein, 6.6; fat, 3.8; nitrogen-free extract, 69.5; crude fibre, 1.1; and ash, 2.2.

Consult United States Department of Agriculture, *Farmer's Bulletin* Nos. 246, 288, 322, 458, 477, and 552 (Washington, 1906-14), and E. G. Montgomery, *Corn Crops: A Discussion of Maize, Kafirs, and Sorghums* (New York, 1913). See Plate of BRAZIL NUT.

COMPOSITION OF KAFIR CORN PRODUCTS

PRODUCT	Water	Protein	Fat	Nitrogen free extract	Crude fibre	Ash
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Whole plant, green .....	76.4	2.4	0.7	12.0	6.6	1.9
Cured fodder, whole plant, dry.....	9.0	8.9	2.8	43.1	26.8	9.4
Stover-cured fodder (without heads), dry .....	16.3	5.1	1.7	41.2	27.4	8.3
Heads (mature).....	12.4	9.6	2.9	65.2	6.4	3.5
Seed .....	11.8	11.1	3.0	70.1	2.3	1.7

In composition, the Kafir corn products closely resemble similar products of maize. Studies at the Kansas Experiment Station have shown that

**SORIA**, sō'rê-â. The capital of the Province of Soria, Spain, 110 miles northeast of Madrid, on the right bank of the Duero (Map: Spain,

D 2). The town, still partially surrounded by thick walls, and dotted with many ancient palaces, presents a mediæval appearance. The collegiate church of San Pedro, its principal structure, has a Latin portal of the twelfth-century style. A solid mediæval bridge crosses the Duero. The town has manufactures of chocolate, leather goods, and linens. Pop., 1900, 7296; 1910, 7535.

**SORITES'** (Lat., from Gk. *σωρίτης*, *sōritēs*, logical sophism formed of an accumulation of arguments). A logical term with a twofold meaning. It is the name of a series of syllogisms so arranged that the suppressed conclusion of each preceding syllogism is a premise of the succeeding; e.g., A is B, B is C, C is D, D is E, and therefore A is E. The term "sorites" is also used to designate a fallacy wherein it is argued that as the addition of each single object to a collection of objects does not change the character of the collection up to a certain point, therefore such addition can be made indefinitely without altering the character of the collection. See LOGIC.

**SORLEY**, sŏr'li, WILLIAM RITCHIE (1855-). A British moralist, born at Selkirk, Scotland. He was educated at Edinburgh University and at Trinity College, Cambridge, and held a fellowship in both places. From 1888 till 1894 he was professor of logic and philosophy at University College, Cardiff; from 1894 until 1900 served as professor of moral philosophy in Aberdeen; and in the latter year became Knight-bridge professor of moral philosophy in the University of Cambridge. His works include: *Hulsean Essay on Jewish Christians and Judaism* (1881); *Shaw Fellowship Lectures on the Ethics of Naturalism* (1885); *Mining Royalties, a Report of an Inquiry Made for the Toynbee Trustees* (1889); *Recent Tendencies in Ethics* (1904); *The Interpretation of Evolution* (1910); *The Moral Life* (1911).

**SORMA**, sŏr'mă, AGNES (COUNTESS MINOTTO) (1865-). A German actress, born in Breslau. She appeared first in Breslau in children's rôles at the age of fourteen. From 1880 to 1882 she played in Görlitz, Posen, and Weimar, and in 1882 was engaged by the Deutsches Theater at Berlin. In 1897-98 Sorma visited the United States, where she appeared with success in Hauptmann's *Versunkene Glocke* and as Nora in Ibsen's *Doll's House*.

**SOROCABA**, sŏr'ŏ-kă'bă. A town of the State of São Paulo, Brazil, 53 miles west of the city of that name, with which it has railway communication (Map: Brazil, H 8). Coffee and sugar are produced, but the main interest centres in a live-stock fair, when the sale of horses and mules sometimes reaches 70,000. Pop., about 12,000.

**SOROKI**, sŏ-rŏ-kê. The capital of a district in the Government of Bessarabia, Russia, situated on the Dniester, 116 miles north of Kishinev (Map: Russia, C 5). It contains the ruins of an old castle and remnant of the Genoese settlement of Olchionia, which stood there in the twelfth and thirteenth centuries. The town has a library, a hospital, several schools and philanthropic institutions. Pop., 1911, 19,500, chiefly Jews and Moldavians.

**SOROLLA Y BASTIDA**, sŏ-rŏl'yă ê bâ-stê'dă, JOAQUIN (1853-1923). An eminent Spanish figure, landscape, and portrait painter. He was born at Valencia and obtained his artistic training principally at the academy there. He

also copied old masters at Madrid and in Italy, but was most influenced by his study of the works of Bastien-Lepage and the German Menzel in Paris. Sorolla first gained recognition with the well-known "Another Marguerite" (1892, St. Louis Museum) and the "Fishing Boats Return" (Luxembourg Museum, Paris). In 1900 he was awarded the Grand Prix at the Paris Salon, after which he produced an incredible number of paintings, holding exhibitions in Paris (1906), London (1908), and at the Hispanic Society, New York (1909), probably the most popular exhibition ever held in New York. Sorolla is one of the foremost and most influential of modern Impressionistic painters. His subjects are chiefly out-of-door scenes with brilliant sunlight—landscapes, marines, fisherfolk, mothers with babies, children at play. His technique is sure and spontaneous, the presentation sincere and robust. With a comparatively simple color scheme he achieves remarkable prismatic effects. Good examples of his work include: "Sewing the Sail" (gold medals, Munich and Vienna, and now in Venice); "A Sad Inheritance" (church of the Ascension, New York); "Swimmers" (1905), "The Bath" (1905), "After the Bath" (1908), and "Beaching the Boat" (all in the Metropolitan Museum, New York, the two last named being lent by the Hispanic Society). His portraits, which include members of the Spanish royal family, the nobility, and other noted people, display forceful characterization and technical brilliancy. Good examples are those of the King and Queen of Spain and Prince Troubetzkoy at the Hispanic Society, which also possesses a number of fine landscapes and figure subjects. The Metropolitan Museum has a portrait of "Señora de Sorolla in Black." Consult *Catalogue of Paintings*, published by the Hispanic Society of America (Chicago, 1911), containing a biographical sketch and bibliography by Leonard Williams.

**SORORITIES**. See FRATERNITIES, *Women's Fraternities*; WOMEN'S CLUBS.

**SOROS**. See MARATHON.

**SOROSIS** (Neo-Lat., from Gk. *σῶρος*, *sōros*, a heap). The first woman's club in America, organized with 12 members in March, 1868, by Mrs. Jane Cunningham Croly, in New York City, and incorporated in January, 1869. Its object is to further the educational and social activities of women, and to bring together for mutual helpfulness representative women in art, literature, science, and kindred pursuits.

**SORREL** (from OF. *sur*, *sour*), *Rumex*. A genus of plants of the family Polygonaceæ. Common sorrel (*Rumex acetosa*) is a perennial herb with erect stems one to two feet high and arrow-shaped leaves, found in pastures throughout Europe. Its leaves are used as a salad and as a potherb, for which purposes it is cultivated. French sorrel, or Roman sorrel (*Rumex scutatus*), a native of France and Italy, with broad, blunt leaves, is more frequently cultivated than common sorrel, being of finer flavor. Sheep's sorrel (*Rumex acetosella*) is a smaller plant with widely spreading roots, on account of which it often becomes troublesome in dry soils. Cultivation and the addition of lime and other fertilizers to the soil quickly eradicate it. Compare DOCK; HIBISCUS; OXALIS.

**SORREL TREE** (*Oxydendrum arboreum*). A tree of the family Ericaceæ, remarkable for its size, which contrasts with its small shrubby relatives. It is found from Pennsylvania to In-

diana and south to Florida, but it grows chiefly from Virginia to Georgia, attains a height of 50 feet, a trunk diameter of 12 to 15 inches, and bears peachlike acid leaves, which are sometimes used for dyeing wool black. The principal use of the tree is as an ornamental. Its wood is of little or no use.

**SORREN'TO.** An episcopal city in the Province of Naples, Italy, situated on a promontory on the southeast side of the Bay of Naples, 16 miles south-southeast of Naples and 10 miles west of Castellamare (Map: Italy, E 4). Its beautiful situation and mild, dry climate have made it a much-frequented resort both for summer and winter visitors, upon whom its prosperity depends. It has a cathedral, a seminary, and a marble statue of the poet Tasso, who was born here. There is a trade in the famous wine of Sorrento, and in olive oil and fruits. Sorrento was originally a Grecian colony. It was called *Surrentum* by the Romans, who embellished it with temples, the ruins of which still remain. Pop., 1911, 7124.

**SORROWS OF WERTHER**, vē'r'tēr. A romance by Goethe (1774), embodying some of the author's own experiences. Just before its production Goethe was battling against unrequited love for Charlotte Buff, and was greatly affected by the suicide of a friend—a man slighted in love. Recognition of possible results in his own case led to the creation of Werther (himself) and his friend (Jerusalem), and of Lotte, typifying the object of the love of each. The romance at once created a sensation and established Goethe's fame.

**SORSOGÓN**, sôr'sô-gôn'. A province of the Philippine Islands, occupying the extreme southeastern portion of the island of Luzon (Map: Philippine Islands, E 4). Area, 755 square miles. It is surrounded by water on three sides, and almost cut into halves by the large Bay of Sorsogón. It is traversed lengthwise by a forest-covered mountain range culminating in the volcano of Bulusan. Sorsogón is a great hemp-producing province, its annual production averaging about 25,000,000 pounds. Copra is also a staple product. The province was created by the Philippine Commission in 1901, having previously been a district of the Province of Albay. Pop., 1903, 120,495, belonging almost entirely to the Vicol tribe. Capital, Sorsogón.

**SORSOGÓN.** The capital of the Province of Sorsogón, south Luzon, Philippines, at the head of the Bay of Sorsogón, 30 miles from the southeast extremity of the island (Map: Philippine Islands, E 4). The bay, which measures 6 by 12 miles, is entirely landlocked, with a narrow entrance from the Visayan Sea and is one of the best harbors in the archipelago. The town is very favorably situated near the Strait of San Bernardino on the route from Manila to the United States. Pop. (est.), 1903, 13,511.

**SORTES** (sôr'tēz) **VERGILIA'NÆ.** See BIBLIOMANCY; SORTILEGE.

**SORTILEGE** (ML. *sortilegium*, divination by lot). The casting of lots. This was an ancient way of distributing shares among several claimants. The choice of lots was performed in the presence of a deity, represented by his image, and accompanied with prayer and sacrifice, being often accomplished in the temple and by a priest. It was, therefore, presumed that the god determined the fall of the lots. Slips of wood, pebbles, potsherds, or arrows were drawn from a

helmet, quiver, or pail, and were usually marked in some indicative manner. A favorite mode of forecasting was to open at random a sacred book and mark the passage first meeting the eye, the significance serving as a token of destiny awaiting the inquirer. As Vergil's *Æneid* came so to be used, the consultation was called *Sortes Vergilianæ*. The Scriptures were employed by Christians; the Arabs use the Koran and the Persians the poems of Hafiz. See DIVINATION.

**SOSISTRATUS.** A founder and leader of the oligarchical party of 600, established at Syracuse in Sicily, about 20 years after the death of Timoleon. Shortly before this Sosistratus led an expedition to Italy to assist the citizens of Crotona against the Bruttii. Later, a revolution having taken place, Sosistratus was forced into exile. With others he appealed to Cleomenes, King of Sparta, for help against Syracuse, especially Agathocles, who, aided by Hamilcar, general of the Carthaginians, was now powerful in Syracuse. (See HAMILCAR, 5.) Cleomenes sent his son, Akrotatus, who presently caused Sosistratus to be assassinated at a banquet. Consult G. Grote, *History of Greece* (new ed., 10 vols., New York, 1899).

**SOSTEGNO**, sôs-tā'nyô, MARQUIS DI. See ALFIERI, CESARE.

**SOSTENUTO**, sôs-tā-nōō'tô (It., sustained). A term used in music to indicate a sustained tone or a uniform rate of decreased speed.

**SOTHEBY**, sūth'bī, WILLIAM (1757-1833). An English translator, educated at Harrow and at the military academy at Angers in France. He was in the English army for a short period, but from 1780 devoted himself to letters, writing poems that fell flat, tragedies not destined to be played, and translations in which he occasionally succeeded. It is as the translator of Vergil's *Georgics* (1800) that he is to be remembered. With less success he turned into English heroic verse the *Iliad* (1830-31) and the *Odyssey* (1834).

**SOTHERN**, sūth'ēr'n, EDWARD ASKEW (1826-81). An English comedian. He was born in Liverpool, and was educated for the Church, but the stage was more congenial to his tastes, and he made his début in Jersey in 1840. In 1852 he went to the United States and appeared at the National Theatre of Boston in the character of Dr. Pangloss. In 1854 he joined Wallack's company and afterward that of Laura Keane. In the character of Lord Dundreary in Tom Taylor's comedy *Our American Cousin* (1858) he made his great success. In 1864 he appeared in *David Garrick*, which was regarded as, next to Dundreary, his best part. His other chief successes were in *Brother Sam* (1865), Sidney Spoonbill in Byron's *Hornet's Nest*, and Fitzaltamont in *The Crushed Tragedian*, with which he appeared in London in 1878. Consult: Pemberton, *Memoir of E. A. Sothorn* (London, 1890); C. Scott, *The Drama of Yesterday and To-day* (2 vols., ib., 1899); M. J. Moses, *Famous Actor-Families in America* (New York, 1906); William Winter, *Other Days* (ib., 1908); E. H. Sothorn (q.v.), "My Remembrances," in *Scribner's Magazine* (ib., January, 1916 et seq.).

**SOTHERN**, EDWARD H. (1859- ). An American actor, the second son of E. A. Sothorn. He was born in New Orleans, La. In 1879 he appeared with his father in New York. His first real success was in *One of our Girls* at the Lyceum, New York, in 1885. During the next ten years his most popular plays were *The*

*Highest Bidder, If I were King, The Three Musketeers, and The Adventures of Lady Ursula.* In 1900 he appeared in *Hamlet*; and in 1904, in conjunction with Julia Marlowe, whom he married in 1911, he began a starring engagement in Shakespearean plays. He quickly took first rank among contemporary Shakespearean actors in America, appearing with great success as Hamlet, Macbeth, Jaques, Petruchio, Malvolio, Shylock, and Romeo. After the retirement of his wife in 1915 he appeared in *The Two Virtues* and in revivals. The next year he announced that he himself would retire at the end of the season, and that he and his wife would make their home in Warwickshire, England. Consult: McKay and Wingate, *Famous American Actors of To-day* (New York, 1896); Strang, *Famous Actors of the Day in America* (Boston, 1900); Wm. Winter, *Vagrant Memories* (New York, 1915); and especially Sothorn's entertaining *My Remembrances* (*Scribner's Magazine*, ib., January, 1916 et seq.).

**SOTO**, sō'tō, HERNANDO (or FERNANDO) DE (c.1500-42). A Spanish adventurer and explorer in America, born at Villanueva de la Serena, Badajoz. In 1514 he accompanied Pedrarias de Avila, his patron, to the Isthmus of Darien, distinguishing himself by daring and independence. In 1524 he joined Córdoba in the expedition to conquer Nicaragua, but remained loyal to Pedrarias when Córdoba rebelled. Leaving Pedrarias in 1528 he explored the coast of Guatemala and Yucatan, seeking for a supposed water communication between the Atlantic and the Pacific. In 1532 he was in Pizarro's expedition for the conquest of Peru, and used all his influence to prevent the murder of the Peruvian Inca. De Soto returned to Spain with a fortune and married the daughter of his former patron, Pedrarias. This was in 1536; De Soto was soon after appointed Governor of Cuba and Florida by Charles V, to whom he had advanced money. Florida had not been thoroughly explored. On May 12, 1539, De Soto sailed from Havana with nearly 600 men. Landing at Tampa Bay, May 25, 1539, he started inland on July 15. For over three years the little army of Spaniards explored the wild country, first penetrating as far north as the two Carolinas, then moving down the Alabama River, then north again, crossing the Mississippi at Chickasaw Bluffs, and finally returning southward to where the Red River joins the Mississippi. The Indians were everywhere brutally treated, the result being constant warfare. Several battles were fought, the most important near Mobile Bay, October, 1540, and, though the Spaniards were uniformly successful, yet over 200 of De Soto's men perished. He himself, worn out and discouraged, succumbed to a fever on the banks of the Mississippi, May 21 or June 25, 1542. His body was secretly sunk in the river lest the hostile Indians should get at it, and the shattered remnants of the expedition, after many further privations, succeeded in floating down the Mississippi to the Gulf of Mexico and reaching their countrymen at Pánuco.

**Bibliography.** A contemporary account of De Soto's expedition is the *Discovery and Conquest of Terra Florida by Don Fernando de Soto and Six Hundred Spaniards*, . . . written by a Gentleman of Elvas, employed in all the action, translated . . . by Richard Hakluyt; reprinted by the Hakluyt Society (London, 1851); and the *Narrative of the Career of Hernando de*

*Soto in the Discovery of Florida by a Knight of Elva, etc.*, edited by Bourne (2 vols., New York, 1904); also: Garcilaso de la Vega, *Historia del Adelantado Hernando de Soto* (Madrid, 1723); Shipp, *History of H. de Soto* (Philadelphia, 1881); George Bancroft, *History of the United States* (6 vols., New York, 1883-85); Justin Winsor, *Narrative and Critical History of America* (8 vols., Boston, 1884-89); Woodbury Lowery, *The Spanish Settlements within the Present Limits of the United States, 1513-1561* (New York, 1911).

**SOTTEVILLE-LES-ROUEN**, sôt'vél' là rōō'ân'. A town in the Department of Seine-Inférieure, France, one mile south of the city of Rouen, of which it is a suburb (Map: France, N., G 3). Pop., 1901, 18,535; 1911, 18,246.

**SOTTO VOCE**, sôt'tō vō'châ (It., under the voice). A musical term denoting that a passage is to be sung or played very softly.

**SOU**, sōō (ML. *solidus*, sort of coin). A former French coin, originally of gold, then of silver, later of copper; towards the end of the eighteenth century struck in bell metal. At various times there were fourth (liard), half, two, and three sou pieces. Its value was 12 deniers (one-twentieth of a livre tournois or one-twenty-fifth of a livre parisien). The copper sou of the eighteenth century weighed 12.238 grains, and while its nominal value remained 12 deniers, it was actually worth only about two. Its coinage ceased upon the adoption of the present decimal monetary system, but the word sou is popularly applied to the five-centime piece—one-twentieth of a franc and worth about one cent.

**SOUARI** (sōō-â'râ) NUTS. See CARYOCAR.  
**SOUBISE**, sōō'béz'. An ancient French family which became extinct in the male line in 1566, the female survivor marrying in 1575 Vicomte René II de Rohan. Two sons were the offspring of this marriage, of whom the elder was Henri, Duke de Rohan (q.v.), a celebrated leader of the Huguenots. The younger son, Benjamin, Sieur de Soubise (1583-1642), served under Maurice of Nassau in the Netherlands, joined his brother in the leadership of the Huguenots, and gained great distinction in the defense of La Rochelle (1627-28) against Richelieu. He died without issue, the title passing to François de Rohan, of whose descendants the best known was Charles de Rohan, Prince de Soubise (1715-87). He served in the War of the Austrian Succession, becoming lieutenant general in 1748. In the Seven Years' War he held important commands and led the French and Imperial forces in the disastrous battle of Rossbach (q.v.) in 1757. He was a field marshal in 1758. In the following year he became a Minister of State. After the Peace of Paris he retired from active participation in military affairs. He had the favor of Madame de Pompadour and afterward that of Madame du Barry. He died July 4, 1787, the last of his line. See ROHAN.

**SUDAN**, sōō-dân'. A region in northern Africa. See SUDAN.

**SOUFFLOT** sōō'flō', JACQUES GERMAIN (1713-81). A French architect, born at Irançay (Yonne). In 1734 he went to Rome as a pensioner of the French Academy. After studying in Italy and Asia Minor he returned to Lyons, where he soon gained distinction. At this period he either constructed or collaborated in the design of every building of importance that was

undertaken in Lyons. In 1749, having become a member of the Royal Academy of Architecture, he removed to Paris. In 1775 he was appointed controller of the buildings of Paris. He is chiefly noted as the architect of the Panthéon (q.v.), which has one of the finest cupolas in existence. Among his other works are the Ecole de Droit in Paris, the Hôtel Dieu in Lyons, the Hôtel de Ville in Bordeaux, and the cathedral of Rennes.

**SOUFRIÈRE**, *sū'frê-är'*, LA. A volcano situated near the north end of the island of St. Vincent (q.v.) in the West Indies. Its height is 3700 feet. It has had three violent eruptions within the last two centuries. In 1718 there was a terrific explosive eruption which covered the whole island with débris. In 1812 another devastating outbreak took place in which a new crater was formed immediately beside the old one. During the next 90 years the volcano was dormant, the old crater being occupied by a lake. On May 7, 1902, there occurred, simultaneously with the eruption of Mont Pelée (q.v.) in Martinique, a violent outburst. The devastation of life was complete on the east and slight in other portions of the northern third of the island, and the ground covered with dust and rocks to the depth of 50 to 60 feet in some places. Two villages were annihilated and about 1350 persons killed. On September 3 there was another outburst almost as violent as the first.

**SOUL** (AS. *sāul*, soul). A term which is used for at least three conceptions. In the most primitive sense the soul is conceived as a refined and intangible material being, often as a sort of diaphanous double of the physical body. In a later sense the term designates the human spirit, conceived to be an immaterial (and usually an immortal) being, which is the source of human life, intelligence, and personality. In a third sense it is used by psychologists to designate the totality of psychical phenomena connected with one individual or one body. In this sense the soul is equivalent either to consciousness considered as a whole or to those factors of consciousness which may be said to constitute the ego, but is not asserted to have any existence outside of or apart from consciousness.

By primitive man the soul was not carefully distinguished from the body; the conception was probably the result of observing the phenomena of dreams and of death. In dreams a man is conscious that he has gone to a distance and has met others, even those long dead, while his body has remained in one spot. In death his body, which has still the same appearance, has suddenly lost all power of motion and feeling. The soul has gone out of it and does not, as after sleep, come back. Beyond this primitive man does not seem to have gone in defining the soul.

The Egyptians developed very definite ideas of the existence of the soul and of its continuation after death, as the Book of the Dead shows; but its life seems to have been connected with the preservation of the body. The earliest philosophical discussions of the nature of the soul arose in India, where the writers of the Upanishads consider the soul (Atman) to be the principle of life, and to be of the same nature as the supreme Atman. Various theories arose in the later schools of philosophy, the most influential of which, the Vedānta, regarded the soul as a manifestation of the Supreme, and

as having no reality except the reality of the single Supreme soul. In this pantheistic sense soul, while the principle of life, has no independent existence. Early Hebrew thought presents the ordinary primitive ideas of the soul as the principle of life, the seat of desires and passions, but laid no special emphasis upon its continuance after death. A trichotomy of body, soul, and spirit appears among the later Jewish and early Christian thinkers, in which "body" (*σῶμα*) is the material, "soul" (*ψυχή*) and "spirit" (*πνεῦμα*) the spiritual part of the human personality; but the tendency is to resolve this threefold division into a dualism in which body and soul are joined against the spirit. This part was regarded as having absolute worth, inasmuch as it is the seat of the divine spirit, and is opposed to the "flesh" (*σάρξ*), i.e., to human nature in estrangement from the divine.

We find a gradual distinction between body and soul in the history of Greek thought. In Homer the soul is a kind of image of the body (*εἰδωλον*), which escapes in death through the mouth or through an open wound. All natural objects are supposed to have souls. Anaxagoras (born 499 B.C.) was the first of the Greek thinkers to formulate the distinction in question in his theory of intelligence (*νοῦς*), which, he contended, is different from body because it is simple, mixes with nothing, is never passive, is infinite, and has absolute power over matter. Socrates added to this theory of Anaxagoras the idea of the good, which he regarded as equivalent to the absolute or God. The deeper reflection of Plato and Aristotle naturally discloses more satisfactory evidence of positive ideas. Plato in particular was much influenced by his general metaphysical theory. Thus in the *Timæus* he teaches that the soul is one of many modes of "the one and the many," by which he means the absolute mind and the phenomenal world of related things ruled by the *demiurgus*. According to Aristotle the soul is the formal, efficient, and final cause (*ἐντελέχεια πρώτη*) of the body (*De Anima*), the unity of three kinds of causality; and he distinguishes three kinds of soul, the vegetable, the sensitive, and the intellectual, which respectively represent the spiritual life of plant, animal, and human beings. As the "final cause" of the body, man's soul cannot be indeterminate; it must have individuality to organize it, direct its movements, and lead it to its true end. Here we approach very near to the modern conception of the soul as an individualized, self-conscious, self-determining reality; but not quite, for this idea was not fully attained by Greek thought.

Among the early Christian philosophers we find a mixture of Greek and Christian ideas. The writings of the Apologists, the Church fathers, particularly Clement of Alexandria and Origen, while they do not reveal any systematic doctrine of the soul, are replete nevertheless with the keenest insight. Anticipating Descartes, Augustine maintained that it is impossible for thought to be an attribute of that which does not think; even if I doubt, the doubt itself must be an act of the soul and therefore a real fact of spiritual significance. If the soul were corporeal, its functions would be limited to the perception of body; but now it has the power of reflection, of knowledge, of love, and is, above all, conscious of itself, and therefore cannot be an attribute of extended

substance merely (*De Trinitate*). The theories developed under scholasticism are for the most part adaptations of the later Greek ideas to the necessities of Church doctrine and authority.

Descartes brought reflection back from scholastic metaphysics to the subjective side of the problem. Descartes discovered, as Augustine and William of Auvergne before him, that to doubt the existence of the soul is to contradict one's self; for doubt is a mental fact, and as such has reality. I think, therefore I am (*cogito, ergo sum*). If it be replied that my thinking does not imply reality then the reply is: God cannot deceive us, and His omnipotence can realize everything we conceive; therefore every clear and distinct idea we have must be real, and since I have a clear and distinct idea of myself and of my body in their distinction, it follows that soul and body are distinct and may exist without each other. Thought and extension are two attributes, and it is thought alone which it is impossible for us to doubt. Thus body and soul are left opposed to each other, so far, at any rate, as man is concerned. Spinoza sought to obtain a unity of the two (thought and extension) and formulated the conception of an underlying soul substance which, as God, differentiates itself in infinite and eternal modes or attributes, characterized under the categories of thought and extension. Leibnitz, not satisfied with the pantheism of Spinoza, sought, in his theory of atoms or monads, to retain the rights of finite personality and things and yet to avoid the crude dualism of Descartes. All things have souls according to Leibnitz; the world consists of an infinite number of them, in all degrees of perfection. If we ask for the nature of their life, inner experience reveals to us an active, real force, viz., our souls, and this is the type of all substance; so that in the world both kinds of reality, thought and extension, consist of perceiving soul life. With this view may be compared that of Berkeley, who carried idealism to its extreme expression in his dictum that the being of things is in their being perceived (*esse = percipi*).

The Empiricists, Hobbes, Locke, Hume, and Mill, developed their views of the soul along the lines laid down by Bacon. Hobbes is openly materialistic; but he is offset by the cautious psychology of Locke, who finds that inner feeling undoubtedly gives us the consciousness of self, though not the substance which underlies it, which is an unknown quantity whose real existence we can neither dogmatically affirm nor deny. These ideas Hume carried to their logical conclusion by denying any existence to the soul as a real or permanent subject: the only reality we know is the phenomenal stream of impressions and ideas. It was the merit of this analysis of Hume that it finally woke up Kant, whose views have greatly influenced recent thought. By an analysis of the human reason Kant sought to show that the real significance of the soul consists in the moral or practical activity, which an accurate knowledge of the laws of thought could do nothing successfully to overthrow. If the system of Kant caused a theoretical schism between the reason as the knowing activity and the will as the moral activity, the reflections of Fichte, Schelling, and Hegel, together with the labors of the modern school of psychology, have done much to heal the breach. On the whole, therefore, we may say that the hypothesis of a soul seems to be

demanding both as a ground of the unity of self-consciousness and also of the universe.

**SÖUL.** See SEOUL.

**SOULE**, söl, GIDEON LANE (1796-1879). An American educator, born at Freeport, Me. He studied at Phillips Exeter Academy in 1813-16, and graduated from Bowdoin College in 1818. Nearly all of the remainder of his life was passed at Exeter as teacher and principal. This latter office he held from 1838 until 1873. The school under his management took a high rank among American preparatory schools.

**SOULE**, JOSHUA (1781-1867). A bishop of the Methodist Episcopal Church South, born at Bristol, Me. He began to preach at the age of 17 and was admitted to the New England Conference in 1799. He was elected book agent in 1816, and during his incumbency founded and edited the *Methodist Magazine*, since developed into the *Methodist Review*. He became Bishop in 1824. When the church divided in 1845 he adhered to the southern section and continued in the bishopric. Consult H. M. Dubose, *Life of Joshua Soule* (Nashville, 1911).

**SOULÉ**, sōō'lá', PIERRE (1802-70). A French-American statesman, born at Castillon, France. He was trained for the priesthood at Toulouse, and afterward studied at Bordeaux. He was involved in a conspiracy against the Bourbons in 1817, and for some time took refuge in Béarn. Later he was permitted to return to France, but in 1825 was sentenced to imprisonment for articles in a radical newspaper reflecting on the ministry. He escaped and settled in New Orleans. There he was admitted to the bar. In 1847 he was appointed to the United States Senate to fill a vacancy, and was elected for the full term in 1849. He represented extreme Southern views, and was prominent in the debates on the compromise measures of 1850. President Pierce appointed him Minister to Spain in 1853. He favored the insurrection in Madrid in 1854 and united with Buchanan and Mason in the Ostend Manifesto (q.v.) of October of the same year relating to the annexation of Cuba. He returned to the United States in 1855. Soulé at first opposed the secession of Louisiana, but afterward joined the secessionists, and was arrested in 1862 for disloyalty and imprisoned. He was released on condition of leaving the country, but ran the blockade at Charleston, and for a short time served on the staff of General Beauregard. In 1863 he went to Havana, but after the close of the war he returned to New Orleans, where he died.

**SOULIÉ**, sōō'lyá', MELCHIOR FRÉDÉRIC (1800-47). A French dramatist and novelist, born at Foix. He was expelled from the law school in Paris for his radicalism. In 1824 he published poems, *Amours français*, and in 1828 his drama *Roméo et Juliette* was produced at the Odéon. In 1832 his play *Clotilde* was performed, followed by other successful pieces, the best known of which is perhaps *La closerie des genêts*

(1846). Among his novels may be cited *Les deux cadavres* (1832), *Mémoires du diable* (1837-38), *Le maître d'école* (1839), *Eulalie Pontois* (1842), and *Saturnin Fichet* (1847-48). Consult Champion, *F. Soulié, sa vie, ses ouvrages* (Paris, 1847).

**SOULOUQUE**, sō'loo'k'. Emperor of Haiti. See FAUSTIN I.

**SOUTL**, sōlt, NICOLAS JEAN DE DIEU, DUKE OF DALMATIA (1769-1851). A French marshal, born at Saint-Amans-la-Bastide, Department of Tarn. He entered the army as a private in 1783, and became general of brigade (1794) for his conduct at Fleurus. In the retreat after the defeat of Stockach (March 25, 1799) he prevented the annihilation of the French army. Appointed general of division (April 21, 1799) under Masséna, whom he ably seconded in Switzerland and Italy, he was afterward appointed by Napoleon to a colonelship of the consular guards and became an ardent supporter of the First Consul. He was created marshal of France in 1804. He achieved success in the campaign against the Austrians, especially at Austerlitz (Dec. 2, 1805), where he pierced the Russian centre. Soult did good service in the Prussian campaign of 1806, fought at Eylau in 1807, and then was appointed Governor of Berlin and created Duke of Dalmatia. He was next placed at the head of the Second Corps in Spain, pursued the retreating British forces under Sir John Moore, attacked them at Corunna (January, 1809), and, though repulsed, forced them to abandon their munitions of war. He occupied Oporto and northern Portugal, but Wellesley's arrival made him retreat. In September, 1809, he became commander in chief in Spain, gained a victory at Ocaña on November 19, and the following year subdued Andalusia. In attempting to succor Badajoz, he was defeated by Beresford at Albuera (May 16, 1811). After the battle of Salamanca and the British advance on Madrid, Soult, his plans rejected for transferring the theatre of war to Andalusia, demanded and obtained his recall. In 1813 he fought in Germany, but when the news of French defeat at Vitoria reached Napoleon Soult was restored to the command of the army of Spain. Later, in France, by a system of able military tactics he neutralized the strategy of Wellington, and reduced the seven months' campaign to a trial of strength. After the entry of the allies into Paris, he unsuccessfully opposed Wellington at Toulouse on April 10, 1814. He became a Royalist after the abdication of Napoleon, and was made Minister of War; on the return of the Emperor from Elba he abandoned Louis XVIII and joined the Imperial army. After Waterloo he was banished and not recalled till May, 1819. He was finally restored to his honors, and took an active part in politics. In 1827 he was created a peer of France, and under Louis Philippe repeatedly held high offices. In 1845 he retired from active duty, and in 1847 was honored with the appointment of marshal-general of France, passing his last years at his residence of Soultberg, near Saint-Amans.

**Bibliography.** His *Mémoires*, published, in part, by his son (3 vols., Paris, 1854); Alexandre Sallé, *Vie politique du maréchal Soult* (ib., 1834); Anacharsis Combes, *Histoire anecdotique de Jean de Dieu Soult* (ib., 1870); Clerc, *Campagne du maréchal Soult dans les Pyrénées* (ib., 1893); Carl Bleibtreu, *Marschall*

*Soult* (Berlin, 1902); J. B. Dumas, *Neuf mois de campagne à la suite du maréchal Soult* (Paris, 1907).

**SOUMET**, sō'mā', ALEXANDRE (1788-1845). A French poet who belonged to the first group of Romanticists. He tried to combine classicism and romanticism and failed to produce a really great work. At different times he held various government positions. Besides several dramas, of which the best known were *Clytemnestre* and *Saül* (1822), he wrote an elegy, *Pauvre fille* (1814), and *Jeanne d'Arc* (1825), and his most pretentious work, a long poem entitled *La divine épopée*. He was elected to the Academy in 1824.

**SOUND.** See ACOUSTICS.

**SOUND, RECORDING OF.** See PHONOGRAPH.

**SOUNDING LEAD.** See LEAD, SOUNDING.

**SOUND, REPRODUCTION OF.** The recording of sound, first realized by Leon Scott in the phonautograph constructed in 1855, and then developed by Cross, König, and other physicists, was naturally the forerunner of all attempts at reproduction which were realized in practical form in the telephone (q.v.), the phonograph (q.v.), and the various machines developed from this fundamental idea. Reproduction of sound depends on the impulses communicated to the air by a vibratory diaphragm which may be set in motion either electrically, as in the case of the telephone, or mechanically, as in the phonograph in one of its various forms. The response of the vibratory diaphragm to the variations in pitch and amplitude of the original sound vibration naturally conditions the faithfulness of the reproduction, and the nature of the diaphragm and its mounting have been the subject of unceasing study by experts of telephone and phonograph companies. When the movement of the diaphragm must be effected by an electric current, then a sheet of iron must be employed so that it will be attracted towards the poles of an electromagnet, depending of course on the variations in the intensity and frequency of the varying currents. On the other hand, if the movement of the diaphragm is effected mechanically, as through the agency of a needle which is in contact with a moving surface indented or otherwise marked, then the diaphragm can be of mica, glass, or other material which will vibrate according to the stimulation it receives through the needle.

In connection with the reproduction apparatus the stylus that traverses the record proof of the disk or cylinder of the phonograph must be considered. It will be recalled that, in a record designed for a cylinder or a disk where the wave line is recorded up and down in a vertical plane, the curve is U-shaped and varies in depth, whereas, if the curve is in a lateral direction, it is V-shaped and extends in a wavy direction along its spiral path. In the first type of instrument a diamond or sapphire point is used with the stylus, as it fits in the U-shaped curve, being ground to a spherical point. On the other hand, in the disk record the record is made laterally, and for reproduction a steel needle is employed, and it should be used but once and then discarded, as it wears itself and then damages the record. Such a needle, used for a second time, not only injures the record, but prevents the best results being obtained, as the needle itself becomes worn and has too long a base bearing for satisfactory tone rendering. In some of the modern machines, in most of

which the resonance horn has been replaced by a sonorous cabinet of wood, the reproducing apparatus is arranged so that, by a transfer of sound-box mechanism, the machine can be made available for records with either lateral or vertical undulations, playing either with equal facility. See GRAMOPHONE; GRAPHOPHONE; PHONOGRAPH, and bibliography there given.

**SOUND, SOUNDING** (probably from Lat. *sub*, under + *undare*, to undulate). The operation of ascertaining the depth of water. In shallow waters (less than 20 fathoms) the depths are ascertained with the lead and line (see LEAD, SOUNDING); in greater depths the deep-sea lead and line are used or else a sounding machine. Beyond a depth of 200 fathoms soundings are not used for the purpose of navigating vessels; but "deep-sea" soundings are taken in all depths in order to ascertain the shape and character of the ocean bottom and its organisms, living and dead. See DEEP-SEA EXPLORATION.

Few attempts to ascertain the depth of the ocean were made before the beginning of the nineteenth century, and it was not until about 1850 that the investigations were at all systematic. The disadvantages under which earlier expeditions labored were such as to preclude not only rapid but reliable work. For the lines rope of ordinary character was used, and the sinkers employed were generally too light. The weight of the rope after it became water-soaked was great, and its bulk, with that of the reels, very troublesome. Inadequate sinkers caused the line to run out very slowly, and the reeling in was both laborious and tedious. Many soundings were made from boats, which still further reduced the speed, especially that of preparing to cast and of reeling in. The first attempt (so far as known) to use wire for the line was that of the well-known exploring expedition sent out by the United States Navy Department in 1838. The wire was of copper, about  $\frac{3}{8}$  of an inch in circumference, with soldered and twisted splices. Owing to lack of appliances for handling, it always broke at 500 to 1000 fathoms, and its use was abandoned. In August, 1894, Captain Barnet, R. N., made a sounding in 2000 fathoms with iron wire. This also broke, and no more attempts with it were made. Three months later, Lieut. J. C. Walsh, U. S. N., in the United States schooner *Taney*, tried to use steel wire, but his efforts were unsuccessful, the wire being too large and the sinkers too small. He reported soundings of 5700 fathoms and no bottom, but the depth was actually less than half as great.

Much work continued to be done with rope lines both before and after these experiments, but especially afterward. In 1840 Captain James F. Ross first noted time intervals in sounding; he also used heavy sinkers, and his results were exceedingly accurate for those days. The question of time intervals was taken up and perfected by Lieutenant (afterward Admiral) Taylor, and other officers of the United States navy, and their observations were of great importance in determining the accuracy of deep-sea work before the invention of the Thomson sounding machine. For a time the United States Navy Department abandoned the use of both wire and rope, and, at the instance of Lieutenant Maury, adopted waxed flax twine, weighing only nine pounds to the statute mile. Between 1851 and 1853 much of the Atlantic

was explored by United States vessels and hundreds of soundings taken (using the twine mostly) with fairly accurate results, though, as no specimens of the bottom were obtained, they were open to question. In 1853-54 Passed Midshipman J. M. Brooke, U. S. N., brought out his cup and detachable sinker, which enabled specimens of the bottom to be obtained while using a heavy weight to keep the line taut when running out. Brooke also developed his table of "standard casts" utilizing the time interval and weight of line out and much improved the sounding apparatus.

The Civil War put an end to the deep-sea work of the United States navy for many years, but it was carried on most successfully by the British, especially by Captain (afterward Admiral) F. P. Shortland, who improved the Brooke sounding machine, and was one of the first to enunciate the important rule in regard to tension on the line: "A sounding line should not be permitted to run free, but should be resisted by a force equal to the weight in water of a length of the line equal to the depth to be determined." The success of the Brooke device and its modifications in bringing up specimens of the bottom and its organisms attracted the attention of naturalists and geologists, and dredging in great depths was attempted. The results of the early (1867-69) work of Count Pourtales under the direction of the United States Coast Survey brought about renewed interest by showing, as Pourtales says, "that animal life exists at great depths in as great an abundance as in shallow water." In 1872 the British government fitted out the celebrated *Challenger* expedition (q.v.) for investigating everything connected with the ocean depths. Although Sir William Thomson had invented his sounding machine and submitted it to the British Admiralty months before the *Challenger* was ready, it was rejected for imperfections which might have been easily corrected, and the *Challenger* sailed with her antiquated outfit of sounding material, whereby time was lost as well as space for supplies and specimens. The United States ship *Tuscarora* under Captain Belknap sailed from San Francisco only four months after the *Challenger*, but the United States Navy Department was wise enough to supply her with one or more Thomson machines in addition to the ordinary rope outfit. The new machines were easily brought into working shape by the *Tuscarora's* officers, and after a few trials entirely superseded the old apparatus. Since that time all deep-sea work has been done by machines, and thousands of soundings have been taken to determine the location for submarine cables which have now become so numerous.

The Thomson sounding machine is of two types, deep-sea and coasting. The latter is now used by nearly all large steamers and by many small ones. It consists of an iron-braced wooden framework or casing which incloses a steel drum about 18 inches in diameter and three inches thick. The disks forming the sides of the drum project beyond the circumference, forming a broad, deep groove for carrying the wire (3-stranded galvanized wire rope is now generally used). On each side are cranks for winding in, and on one side there is a friction brake and clutch, while on the other there is a dial, showing the number of fathoms (0 to 200) out, which is operated by gearing from

the axle of the drum. The sinker consists of a lead of the usual shape, weighing about 22 pounds, through which is thrust an iron rod, the whole sinker being 46 inches long from bottom of lead to top of rod. The wire rope is made fast to a fathom or two of small soft line, which is secured at the other end to an eye in the upper end of the sinker rod. The manner of obtaining the depth is independent of the length of wire out, and the depth is registered by means of a Thomson chemical tube, a Tanner-Blish tube, or the depth recorder. The Thomson tube is a slender glass tube, about two feet long, closed at one end, and filled with chromate of silver. It is placed in a slightly larger brass tube, which has holes in it to admit the sea water freely and is lashed to the sinker. The machine is installed near the stern or on the ship's rail. To sound, the sinker is lowered over the stern, the line dropped in a fair leader to insure free running, and when all is ready the brake is tripped by a movement of the crank. The sinker drops rapidly to the bottom and the moment it reaches it the line slacks perceptibly and the reel is stopped. The line is then reeled in. If the Thomson tube is used, it is removed from the brass receptacle and lid against a special scale. The sea water has forced itself in the open end to a distance depending upon the pressure (i.e., the depth); as far as it reaches the chemical in the tube is discolored, and this point falls abreast the division of the scale which corresponds to the depth of water. Since the measurement is independent of the amount of wire out, the sounding may be taken with the ship going at full speed if the depth is not too great. The Tanner-Blish is similar to the Thomson tube, except that it contains no chemical. If the tubes are kept carefully dried the distance the water has risen is easily noted; and by redrying the tubes they may be used over and over again. The depth recorder works on a similar principle, and is attached to the sinker in the same way. The pressure of the water acts against a piston which compresses a spring and carries a sliding index. When the pressure is slacking the piston returns to its initial position under pressure of the spring, but the index remains at the point of the scale to which it is pushed, so that the depth is read off at once.
